3. Loaders of carts in the dust-yard for shipment.
4. Carriers of cinders to the cinder-heap, or bricks to the brick-heap.
5. Foreman or forewoman of the heap.

II. LABOURERS PAID BY THE HILL-MAN OR HILL-WOMAN.
1. *Sifters*, who are generally women, and mostly the wives or concubines of the dustmen, but sometimes the wives of badly-paid labourers.
2. *Fillers-in*, or shovellers of dust into the sieves of the sifters (one man being allowed to every two or three women).
3. *Carriers* of bones, rags, metal, and other perquisites to the various heaps; these are mostly children of the dustmen.

A medium-sized dust-yard will employ about twelve collectors, three fillers-in, six sifters, and one foreman or forewoman; while a large yard will afford work to about 150 people.

There are four different modes of payment prevalent among the several labourers employed at the metropolitan dust-yards:—(1) by the day; (2) by the piece or load; (3) by the lump; (4) by perquisites.

1st. The foreman of the yard, where the master does not perform this duty himself, is generally one of the regular dustmen picked out by the master, for this purpose. He is paid, the sum of 2*s.* 6*d.* per day, or 15*s.* per week. In large yards there are sometimes two and even three yard-foremen at the same rate of wages. Their duty is merely to superintend the work. They do not labour themselves, and their exemption in this respect is considered, and indeed looked on by themselves, as a sort of premium for good services.

2nd. The carters or collectors are generally

paid 9*d.* per load for every load they bring into the yard. This is, of course, piece work, for the more hours the men work the more loads will they be enabled to bring, and the more pay will they receive. There are some yards where the carters get only 6*d.* per load, as, for instance, at Paddington. The Paddington men, however, are not considered inferior workmen to the rest of their fellows, but merely to be worse paid. In 1826, or 25 years ago, the carters had 1*s.* 6*d.* per load; but at that time the contractors were able to get 1*l.* per chaldron for the soil and "brieze" or cinders; then it began to fall in value, and according to the decrease in the price of these commodities, so have the wages of the dust-collectors been reduced. It will be at once seen that the reduction in the wages of the dustmen bears no proportion to the reduction in the price of soil and cinders, but it must be borne in mind that whereas the contractors formerly paid large sums for liberty to collect the dust, they now are paid large sums to remove it. This in some measure helps to account for the apparent disproportion, and tends, perhaps, to equalize the matter. The carters, therefore, have 4½*d.* each, per load when best paid. They consider from four to six loads a good day's work, for where the contract is large, extending over several parishes, they often have to travel a long way for a load. It thus happens that while the men employed by the Whitechapel contractor can, when doing their utmost, manage to bring only four loads a day to the yard, which is situated in a place called the "ruins" in Lower Shadwell, the men employed by the Shadwell contractor can easily get eight or nine loads in a day. Five loads are about an average day's work, and this gives them 1*s.* 10½*d.* per day each, or 11*s.* 3*d.* per week. In addition to this, the men have their perquisites "in aid of wages." The collectors are in the habit of getting beer or money in lieu thereof, at nearly all the houses from which they remove the dust, the public being thus in a manner compelled to make up the rate of wages, which should be paid by the employer, so that what is given to benefit the men really goes to the master, who invariably reduces the wages to the precise amount of the perquisites obtained. This is the main evil of the "perquisite system of payment" (a system of which the mode of paying waiters may be taken as the special type). As an instance of the injurious effects of this mode of payment in connection with the London dustmen, the collectors are forced, as it were, to extort from the public that portion of their fair earnings of which their master deprives them; hence, how can we wonder they make it a rule when they receive neither beer nor money from a house to make as great a mess as possible the next time they come, scattering the dust and cinders about in such a manner, that, sooner than have any trouble with them, people mostly give them what they look for? One of the most intelligent men with whom I have spoken, gave me the following account of his perquisites for the last week, viz.: Monday, 5½*d.*; Tuesday, 6*d.*; Wednesday, 4½*d.*; Thursday, 7*d.*; Friday, 5½*d.*; and Saturday, 5*d.* This he received in money, and was independent of beer. He had on the same week drawn five loads each day, to the yard, which made his gross earnings for the week, wages and perquisites together, to be 14*s.* 0½*d.* which he considers to be a fair average of his weekly earnings as connected with dust.

3rd. The loaders of the carts for shipment are the same persons as those who collect the dust, but thus employed for the time being. The pay for this work is by the "piece" also, 2*d.* per chaldron between four persons being the usual rate, or ½*d.* per man. The men engaged at this work have no perquisites. The barges into which they shoot the soil or "brieze," as the case may be, hold from 50 to 70 chaldrons, and they consider the loading of one of these barges a good day's work. The average cargo is about 60 chaldrons, which gives them 2*s.* 6*d.* per day, or somewhat more than their average earnings when collecting.

4th. The carriers of cinders to the cinder heap. I have mentioned that, ranged round the sifters in the dust-yard, are a number of baskets, into which are put the various things found among the dust, some of these being the property of the master, and others the perquisites of the hill man or woman, as the case may be. The cinders and old bricks are the property of the master, and to remove them to their proper heaps boys are employed by him at 1*s.* per day. These boys are almost universally the children of dustmen and sifters at work in the yard, and thus not only help to increase the earnings of the family, but qualify themselves to become the dustmen of a future day.

5th. The hill-man or hill-woman. The hill-man enters into an agreement with the contractor to sift *all* the dust in the yard throughout the year at so much per load and perquisites. The usual sum per load is 6*d.*, nor have I been able to ascertain that any of these people undertake to do it at a less price. Such is the amount paid by the contractor for Whitechapel. The perquisites of the hill-man or hill-woman, are rags, bones, pieces of old metal, old tin or iron vessels, old boots and shoes, and one-half of the money, jewellery, or other valuables that may be found by the sifters.

The hill-man or hill-woman employs the following persons, and pays them at the following rates.

1st. The sifters are paid 1*s.* per day when employed, but the employment is not constant. The work cannot be pursued in wet weather, and the services of the sifters are required only when a large heap has accumulated, as they can sift much faster than the dust can be collected. The employment is therefore precarious; the payment has not, for the last 30 years at least, been more than 1*s.* per day, but the perquisites were greater. They formerly were allowed one-half of whatever was found; of late years, however, the hill-man has gradually reduced the perquisites "first one thing and then another," until the only one they have now remaining is half of whatever money or other valuable article may be found in the process of sifting. These valuables the sifters often pocket, if able to do so unperceived, but if discovered in the attempt, they are immediately discharged.

2nd. "The fillers-in," or shovellers of dust into the sieves of sifters, are in general any poor fellows who may be straggling about in search of employment. They are sometimes, however, the grown-up boys of dustmen, not yet permanently engaged by the contractor. These are paid 2*s.* per day for their labour, but they are considered more as casualty men, though it often happens, if "hands" are wanted, that they are regularly engaged by the contractors, and become regular dustmen for the remainder of their lives.

3rd. The little fellows, the children of the dustmen, who follow their mothers to the yard, and help them to pick rags, bones, &c., out of the sieve and put them into the baskets, as soon as they are able to carry a basket between two of them to the separate heaps, are paid 3*d.* or 4*d.* per day for this work by the hill-man.

The wages of the dustmen have been increased within the last seven years from 6*d.* per load to 8*d.* among the large contractors—the "small masters," however, still continue to pay 6*d.* per load. This increase in the rate of remuneration was owing to the men complaining to the commissioners that they were not able to live upon what they earned at 6*d.*; an enquiry was made into the truth of the men's assertion, and the result was that the commisioners decided upon letting the contracts to such parties only as would undertake to pay a fair price to their workmen. The contractors, accordingly, increased the remuneration of the labourers; since that principal masters have paid 8*d.* per load to the collectors. It is right I should add, that I could not hear—though I made special enquiries on the subject—that the wages had been in any one instance reduced since Free-trade has come into operation.

The usual hours of labour vary according to the mode of payment. The "collectors," or men out with the cart, being paid by the load, work as long as the light lasts; the "fillers-in" and sifters, on the other hand, being paid by the day, work the ordinary hours, viz., from six to six, with the regular intervals for meals.

The summer is the worst time for all hands, for then the dust decreases in quantity; the collectors, however, make up for the "slackness" at this period by nightwork, and, being paid by the "piece" or load at the dust business, are not discharged when their employment is less brisk.

It has been shown that the dustmen who perambulate the streets usually collect five loads in a day; this, at 9*d.* per load, leaves them about 1*s.* 10½*d.* each, and so makes their weekly earnings amount to about 11*s.* 3*d.* per week. Moreover, there are the "perquisites" from the houses whence they remove the dust; and further, the dust-collectors are frequently employed at the night-work, which is always a distinct matter from the dust-collecting, &c., and paid for independent of their regular weekly wages, so that, from all I can gather, the average wages of the men appear to be nearer 1*l.* a week than 15*s.* Some admitted to me, that in busy times they often earned 25*s.* a week.

Then, again, dustwork, as with the weaving of silk, is a kind of family work. The husband, wife, and children (unfortunately) all work at it. The consequence is, that the earnings of the whole have to be added together in order to arrive at a notion of the aggregate gains.

The following may therefore be taken as a fair average of the earnings of a dustman and his family *when in full employment.* The elder boys when able to earn 1*s.* a day set up for themselves, and do not allow their wages to go into the common purse.

	£.	*s.*	*d.*	£.	*s.*	*d.*
Man, 5 loads per day, or 30 loads per week, at 4½*d.* per load	0	11	3			
Perquisites, or beer money	0	2	9½			
Night-work for 2 nights a week	0	5	0			
				0	19	0½
Woman, or sifter, per week, at 1*s.* per day	0	6	0			
Perquisites, say 3*d.* a day	0	1	6			
				0	7	6
Child, 3*d.* per day, carrying rags, bones, &c.				0	1	6
Total				1	8	0½

These are the earnings, it should be borne in mind, of a family in full employment. Perhaps it may be fairly said that the earnings of the single men are, on an average, 15*s.* a week, and 1*l.* for the family men all the year round.

Now, when we remember that the wages of many agricultural labourers are but 8*s.* a week, and the earnings of many needlewomen not 6*d.* a day, it must be confessed that the remuneration of the dustmen, and even of the dustwomen, is comparatively high. This certainly is not due to what Adam Smith, in his chapter on the Difference of Wages, terms the "disagreeableness of the employment." "The wages of labour," he says, "vary with the ease or hardship, the cleanliness or dirtiness, the honourableness or dishonourableness, of the employment." Nevertheless it will be seen—when we come to treat of the nightmen—that the most offensive, and perhaps the least honourable, of all trades, is far from ranking among the best paid, as it should, if the above principle held good. That the disagreeableness of the occupation may in a measure tend to decrease the competition among the labourers, there cannot be the least doubt, but that it will consequently induce, as political economy would have us believe, a larger amount of wages to accrue to each of the labourers, is certainly another of the many assertions of that science which must be pronounced "not proven." For the dustmen are paid, if anything, less, and certainly not more, than the usual rate of payment to the London labourers; and if the earnings rank high, as times go, it is because all the members of the family, from the very earliest age, are able to work at the business, and so add to the general gains.

The dustmen are, generally speaking, an hereditary race; when children they are reared in the dust-yard, and are habituated to the work gradually as they grow up, after which, almost as a natural consequence, they follow the business for the remainder of their lives. These may be said to be born-and-bred dustmen. The numbers of the regular men are, however, from time to time recruited from the ranks of the many ill-paid labourers with which London abounds. When hands are wanted for any special occasion an employer has only to go to any of the dock-gates, to find at all times hundreds of starving wretches anxiously watching for the chance of getting something to do, even at the rate of 4*d.* per hour. As the operation of emptying a dust-bin requires only the ability to handle a shovel, which every labouring man can manage, all workmen, however unskilled, can at once engage in the occupation; and it often happens that the men thus casually employed remain at the calling for the remainder of their lives. There are no houses of call whence the men are taken on when wanting work. There are certainly public-houses, which are denominated houses of call, in the neighbourhood of every dust-yard, but these are merely the drinking shops of the men, whither they resort of an evening after the labour of the day is accomplished, and whence they are furnished in the course of the afternoon with beer; but such houses cannot be said to constitute the dustman's "labour-market," as in the tailoring and other trades, they being never resorted to as hiring-places, but rather used by the men only when hired. If a master have not enough "hands" he usually inquires among his men, who mostly know some who—owing, perhaps, to the failure of their previous master in getting his usual contract—are only casually employed at other places. Such men are immediately engaged in preference to others; but if these cannot be found, the contractors at once have recourse to the system already stated.

The manner in which the dust is collected is very simple. The "filler" and the "carrier" perambulate the streets with a heavily-built high box cart coated with a thick crust of filth, and drawn by a clumsy-looking horse. These men used, before the passing of the late Street Act, to ring a dull-sounding bell so as to give notice to housekeepers of their approach, but now they merely cry, in a hoarse unmusical voice, "Dust oy-eh!" Two men accompany the cart, which is furnished with a short ladder and two shovels and baskets. These baskets one of the men fills from the dust-bin, and then helps them alternately, as fast as they are filled, upon the shoulder of the other man, who carries them one by one to the cart, which is placed immediately alongside the pavement in front of the house where they are at work. The carrier mounts up the side of the cart by means of the ladder, discharges into it the contents of the basket on his shoulder, and then returns below for the other basket which his mate has filled for him in the interim. This process is pursued till all is cleared away, and repeated at different houses till the cart is fully loaded; then the men make the best of their way to the dust-yard, where they shoot the contents of the cart on to the heap, and again proceed on their regular rounds.

The dustmen, in their appearance, very much resemble the waggoners of the coal-merchants. They generally wear knee-breeches, with ancle boots or gaiters, short dirty smockfrocks or coarse gray jackets, and fantail hats. In one particular, however, they are at first sight distinguishable from the coal-merchants' men, for the latter are invariably black from coal dust, while the dustmen, on the contrary, are gray with ashes.

In their personal appearance the dustmen are mostly tall stalwart fellows; there is nothing sickly-looking about them, and yet a considerable part of their time is passed in the yards and in the midst of effluvia most offensive, and, if we believe "zymotic theorists," as unhealthy to those unaccustomed to them; nevertheless, the children, who may be said to be reared in the yard and to have inhaled the stench of the dust-heap with their first breath, are healthy and strong. It is said, moreover, that during the plague in London the dustmen were the persons who carted away the dead, and it remains a tradition among the class to the present day, that not one of them died of the plague, even during its greatest ravages. In Paris, too, it is well known, that, during the cholera of 1849, the quarter of Belleville, where the night-soil and refuse of the city is deposited, escaped the freest from the pestilence; and in London the dustmen boast that, during both the recent visitations of the cholera, they were altogether exempt from the disease. "Look at that fellow, sir!" said one of the dust-contractors to me, pointing to his son, who was a stout red-cheeked young man of about twenty. "Do you see anything ailing about him? Well, he has been in the yard since he was born. There stands my house just at the gate, so you see he hadn't far to travel, and when quite a child he used to play and root away here among the dust all his time. I don't think he ever had a day's illness in his life. The people about the yard are all used to the smell and don't complain about it. It's all stuff and nonsense, all this talk about dust-yards being unhealthy. I've never done anything else all my days and I don't think I look very ill. I shouldn't wonder now but what I'd be set down as being fresh from the sea-side by those very fellows that write all this trash about a matter that they don't know just *that* about;" and he snapped his fingers contemptuously in the air, and, thrusting both hands into his breeches pockets, strutted about, apparently satisfied that he had the best of the argument. He was, in fact, a stout, jolly, red-faced man. Indeed, the dustmen, as a class, appear to be healthy, strong men, and extraordinary instances of longevity are common among them. I heard of one dustman who lived to be 115 years; another, named Wood, died at 100; and the well-known Richard Tyrrell died only a short time back at the advanced age of 97. The misfortune is, that we have no large series of facts on this subject, so that the longevity and

Original from HARVARD UNIVERSITY

health of the dustmen might be compared with those of other classes.

In almost all their habits the Dustmen are similar to the Costermongers, with the exception that they seem to want their cunning and natural quickness, and that they have little or no predilection for gaming. Costermongers, however, are essentially traders, and all trade is a species of gambling—the risking of a certain sum of money to obtain more; hence spring, perhaps, the gambling propensities of all low traders, such as costers, and Jew clothes-men; and hence, too, that natural sharpness which characterizes the same classes. The dustmen, on the contrary, have regular employment and something like regular wages, and therefore rest content with what they can earn in their usual way of business.

Very few of them understand cards, and I could not learn that they ever play at "pitch and toss." I remarked, however, a number of parallel lines such as are used for playing "shove halfpenny," on a deal table in the tap-room frequented by them. The great amusement of their evenings seems to be, to smoke as many pipes of tobacco and drink as many pots of beer as possible.

I believe it will be found that all persons in the habit of driving horses, such as cabmen, 'busmen, stage-coach drivers, &c., are peculiarly partial to intoxicating drinks. The cause of this I leave others to determine, merely observing that there would seem to be two reasons for it: the first is, their frequent stopping at public-houses to water or change their horses, so that the idea of drinking is repeatedly suggested to their minds even if the practice be not *expected* of them; while the second reason is, that being out continually in the wet, they resort to stimulating liquors as a preventive to "colds" until at length a habit of drinking is formed. Moreover, from the mere fact of passing continually through the air, they are enabled to drink a greater quantity with comparative impunity. Be the cause, however, what it may, the dustmen spend a large proportion of their earnings in drink. There is always some public-house in the neighbourhood of the dust-yard, where they obtain credit from one week to another, and here they may be found every night from the moment their work is done, drinking, and smoking their long pipes—their principal amusement consisting in "chaffing" each other. This "chaffing" consists of a species of scurrilous jokes supposed to be given and taken in good part, and the noise and uproar occasioned thereby increases as the night advances, and as the men get heated with liquor. Sometimes the joking ends in a general quarrel; the next morning, however, they are all as good friends as ever, and mutually agree in laying the blame on the "cussed drink."

One-half, at least, of the dustmen's earnings, is, I am assured, expended in drink, both man and woman assisting in squandering their money in this way. They usually live in rooms for which they pay from 1*s.* 6*d.* to 2*s.* per week rent, three or four dust-men and their wives frequently lodging in the same house. These rooms are cheerless-looking, and almost unfurnished—and are always situate in some low street or lane not far from the dust-yard. The men have rarely any clothes but those in which they work. For their breakfast the dustmen on their rounds mostly go to some cheap coffee-house, where they get a pint or half-pint of coffee, taking their bread with them as a matter of economy. Their midday meal is taken in the public-house, and is almost always bread and cheese and beer, or else a saveloy or a piece of fat pork or bacon, and at night they mostly "wind up" by deep potations at their favourite house of call.

There are many dustmen now advanced in years born and reared at the East-end of London, who have never in the whole course of their lives been as far west as Temple-bar, who know nothing whatever of the affairs of the country, and who have never attended a place of worship. As an instance of the extreme ignorance of these people, I may mention that I was furnished by one of the contractors with the address of a dustman whom his master considered to be one of the most intelligent men in his employ. Being desirous of hearing his statement from his own lips I sent for the man, and after some conversation with him was proceeding to note down what he said, when the moment I opened my note-book and took the pencil in my hand, he started up, exclaiming,—"No, no! I'll have none of that there work—I'm not such a b—— fool as you takes me to be—I doesn't understand it, I tells you, and I'll not have it, now that's plain;" —and so saying he ran out of the room, and descended the entire flight of stairs in two jumps. I followed him to explain, but unfortunately the pencil was still in one hand and the book in the other, and immediately I made my appearance at the door he took to his heels, again with three others who seemed to be waiting for him there. One of the most difficult points in my labours is to make such men as these comprehend the object or use of my investigations.

Among 20 men whom I met in one yard, there were only five who could read, and only two out of that five could write, even imperfectly. These two are looked up to by their companions as prodigies of learning and are listened to as oracles, on all occasions, being believed to understand every subject thoroughly. It need hardly be added, however, that their acquirements are of the most meagre character.

The dustmen are very partial to a song, and always prefer one of the doggrel street ballads, with what they call a "jolly chorus" in which, during their festivities, they all join with stentorian voices. At the conclusion there is usually a loud stamping of feet and rattling of quart pots on the table, expressive of their approbation.

The dustmen never frequent the twopenny hops, but sometimes make up a party for the "theaytre." They generally go in a body with their wives, if married, and their "gals," if single. They are always to be found in the gallery, and greatly enjoy the melodramas performed at the second-class minor theatres, especially if there be plenty of murdering scenes in them. The Garrick, previous to its being burnt, was a favourite

resort of the East-end dustmen. Since that period they have patronized the Pavilion and the City of London.

The politics of the dustmen are on a par with their literary attainments—they cannot be said to have any. I cannot say that they are Chartists, for they have no very clear knowledge of what "the charter" requires. They certainly have a confused notion that it is something against the Government, and that the enactment of it would make them all right; but as to the nature of the benefits which it would confer upon them, or in what manner it would be likely to operate upon their interest, they have not, as a body, the slightest idea. They have a deep-rooted antipathy to the police, the magistrates, and all connected with the administration of justice, looking upon them as their natural enemies. They associate with none but themselves; and in the public-houses where they resort there is a room set apart for the special use of the "dusties," as they are called, where no others are allowed to intrude, except introduced by one of themselves, or at the special desire of the majority of the party, and on such occasions the stranger is treated with great respect and consideration.

As to the morals of these people, it may easily be supposed that they are not of an over-street character. One of the contractors said to me, "I 'd just trust one of them as far as I could fling a bull by the tail; *but then*," he added, with a callousness that proved the laxity of discipline among the men was due more to his neglect of his duty to them than from any special perversity on their parts, *"that's none of my business; they do my work, and that's all I want with them, and all I care about.* You see they 're not like other people, they 're reared to it. Their fathers before them were dustmen, and when lads they go into the yard as sifters, and when they grow up they take to the shovel, and go out with the carts. They learn all they know in the dust-yards, and you may judge from that what their learning is likely to be. If they find anything among the dust you may be sure that neither you nor I will ever hear anything about it; ignorant as they are, they know a little too much for that. They know, as well as here and there one, where the dolly-shop is; *but, as I said before, that's none of my business. Let every one look out for themselves, as I do, and then they need not care for any one."* [With such masters professing such principles—though it should be stated that the sentiments expressed on this occasion are but similar to what I hear from the lower class of traders every day—how can it be expected that these poor fellows can be above the level of the mere beasts of burden that they use.] "As to their women," continued the master, "I don't trouble my head about such things. I believe the dustmen are as good to them as other men; and I 'm sure their wives would be as good as other women, if they only had the chance of the best. But you see they 're all such fellows for drink that they spend most of their money that way, and then starve the poor women, and knock them about at a shocking rate, so that they have the life of dogs, or worse. I don't wonder at anything they do. Yes, they 're all married, as far as I know; that is, they live together as man and wife, though they 're not very particular, certainly, about the ceremony. The fact is, a regular dustman don't understand much about such matters, and, I believe, don't care much, either."

From all I could learn on this subject, it would appear that, for one dustman that is married, 20 live with women, but remain constant to them; indeed, both men and women abide faithfully by each other, and for this reason—the woman earns nearly half as much as the man. If the men and women were careful and prudent, they might, I am assured, live well and comfortable; but by far the greater portion of the earnings of both go to the publican, for I am informed, on competent authority, that a dustman will not think of sitting down for a spree without his woman. The children, as soon as they are able to go into the yard, help their mothers in picking out the rags, bones, &c., from the sieve, and in putting them in the basket. They are never sent to school, and as soon as they are sufficiently strong are mostly employed in some capacity or other by the contractor, and in due time become dustmen themselves. Some of the children, in the neighbourhood of the river, are mud-larks, and others are bone-grubbers and rag-gatherers, on a small scale; neglected and thrown on their own resources at an early age, without any but the most depraved to guide them, it is no wonder to find that many of them turn thieves. To this state of the case there are, however, some few exceptions.

Some of the dustmen are prudent well-behaved men and have decent homes; many of this class have been agricultural labourers, who by distress, or from some other cause, have found their way to London. This was the case with one whom I talked with: he had been a labourer in Essex, employed by a farmer named Izzod, whom he spoke of as being a kind good man. Mr. Izzod had a large farm on the Earl of Mornington's estate, and after he had sunk his capital in the improvement of the land, and was about to reap the fruits of his labour and his money, the farmer was ejected at a moment's notice, beggared and broken-hearted. This occurred near Roydon, in Essex. The labourer, finding it difficult to obtain work in the country, came to London, and, discovering a cousin of his engaged in a dust-yard, got employed through him at the same place, where he remains to the present day. This man was well clothed, he had good strong lace boots, gray worsted stockings, a stout pair of corduroy breeches, a short smockfrock and fantail. He has kept himself aloof, I am told, from the drunkenness and dissipation of the dustmen. He says that many of the new hands that get to dustwork are mechanics or people who have been "better off," and that these get thinking about what they have been, till to drown their care they take to drinking, and

Original from HARVARD UNIVERSITY

often become, in the course of a year or so, worse than the "old hands" who have been reared to the business and have "nothing at all to think about."

Among the dustmen there is no "Society" nor "Benefit Club," specially devoted to the class—no provident institution whence they can obtain "relief" in the event of sickness or accident. The consequence is that, when ill or injured, they are obliged to obtain letters of admission to some of the hospitals, and there remain till cured. In cases of total incapacity for labour, their invariable refuge is the workhouse; indeed they look forward (whenever they foresee at all) to this asylum as their resting-place in old age, with the greatest equanimity, and talk of it as "the house" par excellence, or as "the big house," "the great house," or "the old house." There are, however, scattered about in every part of London numerous benefit clubs made up of working-men of every description, such as Old Friends, Odd Fellows, Foresters, and Birmingham societies, and with some one or other of these the better class of dustmen are connected. The general rule, however, is, that the men engaged in this trade belong to no benefit club whatever, and that in the season of their adversity they are utterly unprovided for, and consequently become burdens to the parishes wherein they happen to reside.

I visited a large dust-yard at the east end of London, for the purpose of getting a statement from one of the men. My informant was, at the time of my visit, shovelling the sifted soil from one of the lesser heaps, and, by a great effort of strength and activity, pitching each shovel-full to the top of a lofty mound, somewhat resembling a pyramid. Opposite to him stood a little woman, stoutly made, and with her arms bare above the elbow; she was his partner in the work, and was pitching shovel-full for shovel-full with him to the summit of the heap. She wore an old soiled cotton gown, open in front, and tucked up behind in the fashion of the last century. She had clouts of old rags tied round her ancles to prevent the dust from getting into her shoes, a sort of coarse towel fastened in front for an apron, and a red handkerchief bound tightly round her head. In this trim she worked away, and not only kept pace with the man, but often threw two shovels for his one, although he was a tall, powerful fellow. She smiled when she saw me noticing her, and seemed to continue her work with greater assiduity. I learned that she was deaf, and spoke so indistinctly that no stranger could understand her. She had also a defect in her sight, which latter circumstance had compelled her to abandon the sifting, as she could not well distinguish the various articles found in the dust-heap. The poor creature had therefore taken to the shovel, and now works with it every day, doing the labour of the strongest men.

From the man above referred to I obtained the following statement:—"Father vos a dustie;—vos at it all his life, and grandfather afore him for I can't tell how long. Father vos allus a rum 'un;—sich a beggar for lush. Vhy I'm blowed if he vouldn't lush as much as half-a-dozen on 'em can lush now; somehow the dusties hasn't got the stuff in 'em as they used to have. A few year ago the fellers 'u'd think nothink o' lushin avay for five or six days without niver going anigh their home. I niver vos at a school in all my life; I don't know what it's good for. It may be wery well for the likes o' you, but I doesn't know it 'u'd do a dustie any good. You see, ven I'm not out with the cart, I digs here all day; and p'raps I'm up all night, and digs avay agen the next day. Vot does I care for reading, or anythink of that there kind, ven I gets home arter my vork? I tell you vot I likes, though! vhy, I jist likes two or three pipes o' baccer, and a pot or two of good heavy and a song, and then I tumbles in with my Sall, and I'm as happy as here and there von. That there Sall of mine's a stunner—a riglar stunner. There ain't never a voman can sift a heap quickerer nor my Sall. Sometimes she yarns as much as I does; the only thing is, she's sitch a beggar for lush, that there Sall of mine, and then she kicks up sitch jolly rows, you niver see the like in your life. That there's the only fault, as I know on, in Sall; but, barring that, she's a hout-and-houter, and worth a half-a-dozen of t' other sifters—pick 'em out vare you likes. No, we ain't married 'zactly, though it's all one for all that. I sticks to Sall, and Sall sticks to I, and there's an end on 't:—vot is it to any von? I rec'lects a-picking the rags and things out of mother's sieve, when I were a young 'un, and a putting 'em all in the heap jist as it might be there. I vos allus in a dust-yard. I don't think I could do no how in no other place. You see I vouldn't be 'appy like; I only knows how to vork at the dust 'cause I'm used to it, and so vos father afore me, and I'll stick to it as long as I can. I yarns about half-a-bull [2*s.* 6*d.*] a day, take one day with another. Sall sometimes yarns as much, and ven I goes out at night I yarns a bob or two more, and so I gits along pretty tidy; sometimes yarnin more and sometimes yarnin less. I niver vos sick as I knows on; I've been queerish of a morning a good many times, but I doesn't call that sickness; it's only the lush and nothink more. The smells nothink at all, ven you gits used to it. Lor' bless you! you'd think nothink on it in a veek's time,—no, no more nor I do. There's tventy on us vorks here—riglar. I don't think there's von on 'em 'cept Scratchey Jack can read, but he can do it stunning; he's out vith the cart now, but he's the chap as can patter to you as long as he likes."

Concerning the capital and income of the Lonnon dust business, the following estimate may be given as to the amount of property invested in and accruing to the trade.

It has been computed that there are 90 contractors, large and small; of these upwards of two-thirds, or about 35, may be said to be in a considerable way of business, possessing many carts and horses, as well as employing a large body of people; some yards have as many as 150 hands connected with them. The remaining 55 masters are composed of "small men," some of whom are

known as "running dustmen," that is to say, persons who collect the dust without any sanction from the parish; but the number belonging to this class has considerably diminished since the great deterioration in the price of "brieze." Assuming, then, that the great and little master dustmen employ on an average between six and seven carts each, we have the following statement as to the

CAPITAL OF THE LONDON DUST TRADE.

600 Carts, at 20*l*. each . . .	£12,000
600 Horses, at 25*l*. each . . .	15,000
600 Sets of harness, at 2*l*. per set.	1,200
600 Ladders, at 5*s*. each . . .	150
1200 Baskets, at 2*s*. each . . .	120
1200 Shovels, at 2*s*. each . . .	120
Being a total capital of . .	£28,590

If, therefore, we assert that the capital of this trade is between 25,000*l*. and 30,000*l*. in value, we shall not be far wrong either way.

Of the annual income of the same trade, it is almost impossible to arrive at any positive results; but, in the absence of all authentic information on the subject, we may make the subjoined conjecture.

INCOME OF THE LONDON DUST TRADE.

Sum paid to contractors for the removal of dust from the 176 metropolitan parishes, at 200*l*. each parish .	£35,200
Sum obtained for 900,000 loads of dust, at 2*s*. 6*d*. per load . . .	112,500
	£147,700

Thus it would appear that the total income of the dust trade may be taken at between 145,000*l*. and 150,000*l*. per annum.

Against this we have to set the yearly outgoings of the business, which may be roughly estimated as follows:—

EXPENDITURE OF THE LONDON DUST TRADE.

Wages of 1800 labourers, at 10*s*. a week each (including sifters and carriers)	£46,800
Keep of 600 horses, at 10*s*. a week each	15,600
Wear and tear of stock in trade .	4000
Rent for 90 yards, at 100*l*. a year each (large and small) . . .	9000
	£75,400

The above estimates give us the following aggregate results:—

Total yearly incomings of the London dust trade	£147,700
Total yearly out-goings . .	75,400
Total yearly profit	£72,300

Hence it would appear that the profits of the dust-contractors are very nearly at the rate of 100*l*. per cent. on their expenditure. I do not think I have over estimated the incomings, or under estimated the out-goings; at least I have striven to avoid doing so, in order that no injustice might be done to the members of the trade.

This aggregate profit, when divided among the 90 contractors, will make the clear gains of each master dustman amount to about 800*l*. per annum: of course some derive considerably more than this amount, and some considerably less.

OF THE LONDON SEWERAGE AND SCAVENGERY.

THE subject I have now to treat—principally as regards street-labour, but generally in its sanitary, social, and economical bearings—may really be termed vast. It is of the cleansing of a capital city, with its thousands of miles of streets and roads *on* the surface, and its thousands of miles of sewers and drains *under* the surface of the earth. And first let me deal with the subject in a historical point of view.

Public scavengery or street-cleansing, from the earliest periods of our history, since municipal authority regulated the internal economy of our cities, has been an object of some attention. In the records of all our civic corporations may be found bye-laws, or some equivalent measure, to enforce the cleansing of the streets. But these regulations were little enforced. It was ordered that the streets should be swept, but often enough men were not employed by the authorities to sweep them; until after the great fire of London, and in many parts for years after that, the tradesman's apprentice swept the dirt from the front of his master's house, and left it in the street, to be removed at the leisure of the scavenger. This was in the streets most famous for the wealth and commercial energy of the inhabitants. The streets inhabited by the poor, until about the beginning of the present century, were rarely swept at all. The unevenness of the pavement, the accumulation of wet and mud in rainy weather, the want of foot-paths, and sometimes even of grates and kennels, made Cowper, in one of his letters, describe a perambulation of some of these streets as "going by water."

Even this state of things was, however, an improvement. In the accounts of the London street-broils and fights, from the reign of Henry III., more especially during the war of the Roses, down to the civil war which terminated in the beheading of Charles I., mention is more or less made of the combatants having availed themselves of the shelter of the rubbish in the streets. These mounds of rubbish were then kinds of street-barricades, opposing the progress of passengers, like the piles of overturned omnibuses and other vehicles of the modern French street-combatants. There is no doubt that in the older times these mounds were composed, first, of the earth dug out for the foundation of some building, or the sinking of some well, or (later on) the formation of some drain; for these works were often long in hand, not only from the interruptions of civil strife and from want of funds, but from indifference, owing to the long delay in

Original from HARVARD UNIVERSITY

their completion, and were often altogether abandoned. After dusk the streets of the capital of England could not be traversed without lanterns or torches. This was the case until the last 40 or 50 years in nearly all the smaller towns of England, but there the darkness was the principal obstacle; in the inferior parts of "Old London," however, there were the additional inconveniences of broken limbs and robbery.

It would be easy to adduce instances from the olden writers in proof of all the above statements, but it seems idle to cite proofs of what is known to all.

The care of the streets, however, as regards the removal of the dirt, or, as the weather might be, the dust and mud, seems never to have been much of a national consideration. It was left to the corporations and the parishes. Each of these had its own especial arrangements for the collection and removal of dirt in its own streets; and as each parochial or municipal system generally differed in some respect or other, taken as a whole, there was no one general mode or system adopted. To all this the street-management of our own days, in the respect of scavengery, and, as I shall show, of sewerage, presents a decided improvement. This improvement in street-management is not attributable to any public agitation—to any public, and, far less, national manifestation of feeling. It was debated sometimes in courts of Common Council, in ward and parochial meetings, but the public generally seem to have taken no express interest in the matter. The improvement seems to have established itself gradually from the improved tastes and habits of the people.

Although *generally* left to the local powers, the subject of street-cleansing and management, however, has not been *entirely* overlooked by parliament. Among parliamentary enactments is the measure best known as "Michael Angelo Taylor's Act," passed early in the present century, which requires all householders every morning to remove from the front of their premises any snow which may have fallen during the night, &c., &c.; the late Police Acts also embrace subordinately the subject of street-management.

On the other hand the sewers have long been the object of national care. "The daily great damages and losses which have happened in many and divers parts of this realm" (I give the spirit of the preamble of several Acts of Parliament), "as well by the reason of the outrageous flowings, surges, and course of the river in and upon the marsh grounds and other low places, heretofore through public wisdom won and made profitable for the great commonwealth of this realm, as also by occasion of land waters and other outrageous springs in and upon meadows, pastures, and other low grounds adjoining to rivers, floods, and other water-courses," caused parliamentary attention to be given to the subject.

Until towards the latter part of the last century, however, the streets even of the better order were often flooded during heavy and continuous rains, owing to the sewers and drains having been choked, so that the sewage forced its way through the gratings into the streets and yards, flooding all the underground apartments and often the ground floors of the houses, as well as the public thoroughfares with filth.

It is not many months since the neighbourhood of so modern a locality as Waterloo-bridge was flooded in this manner, and boats were used in the Belvidere and York-roads. On the 1st of August, 1846, after a tremendous storm of thunder, hail, and rain, miles of the capital were literally under water; hundreds of publicans' beer-cellars contained far more water than beer, and the damage done was enormous. These facts show that though much has been accomplished towards the efficient sewerage of the metropolis, much remains to be accomplished still.

The first statute on the subject of the public sewerage was as early as the 9th year of the reign of Henry III. There were enactments, also, in most of the succeeding reigns, but they were all partial and conflicting, and related more to local desiderata than to any system of sewerage for the public benefit, until the reign of Henry VIII., when the "Bill of Sewers" was passed (in 1531). This act provided for a more general system of sewerage in the cities and towns of the kingdom, requiring the main channels to be of certain depths and dimensions, according to the localities, situation, &c. In many parts of the country the sewerage is still carried on according to the provisions in the act of Henry VIII., but those provisions were modified, altered, or "explained," by many subsequent statutes.

Any uniformity which might have arisen from the observance of the same principles of sewerage was effectually checked by the measures adopted in London, more especially during the last 100 years. As the metropolis increased new sewerage became necessary, and new local bodies were formed for its management. These were known as the Commissions of Sewers, and the members of those bodies acted independently one of another, under the authority of their own Acts of Parliament, each having its own board, engineers, clerks, officers, and workmen. Each commission was confined to its own district, and did what was accounted best for its own district with little regard to any general plan of sewerage, so that London was, and in a great measure is, sewered upon different principles, as to the size of the sewers and drains, the rates of inclination, &c. &c. In 1847 there were eight of these districts and bodies: the City of London, the Tower Hamlets, Saint Katherine's, Poplar and Blackwall, Holborn and Finsbury, Westminster and part of Middlesex, Surrey and Kent, and Greenwich. In 1848 these several bodies were concentrated by act of parliament, and entitled the "Metropolitan Commission of Sewers;" but the City of London, as appears to be the case with every parliamentary measure affecting the metropolis, presents an exception, as it retains a separate jurisdiction, and is not under the control of the general commissioners, to whom parliament has given authority over such matters.

The management of the metropolitan scaven-

Original from HARVARD UNIVERSITY

gery and sewerage, therefore, differs in this respect. The scavengery is committed to the care of the several parishes, each making its own contract; the sewerage is consigned by Parliament to a body of commissioners. In both instances, however, the expenses are paid out of local rates.

I shall now proceed to treat of each of these subjects separately, beginning with the cleansing of the streets.

Of the Streets of London.

There are now three modes of pavement in the streets of the metropolis.

1. *The stone pavement* (commonly composed of Aberdeen granite).
2. *The macadamized pavement*, or rather *road*.
3. *The wood pavement*.

The stone pavement has generally, in the several towns of England, been composed of whatever material the quarries or rocks of the neighbourhood supplied, limestone being often thus used. In some places, where there were no quarries available, the stones of a river or rivulet-side were used, but these were rounded and slippery, and often formed but a rugged pathway. For London pavement, the neighbourhood not being rich in stone quarries, granite has usually been brought by water from Scotland, and a small quantity from Guernsey for the pavement of the streets. The stone pavement is made by the placing of the granite stones, hewn and shaped ready for the purpose, side by side, with a foundation of concrete. The concrete now used for the London street-pavement is Thames ballast, composed of shingles, or small stones, and mixed with lime, &c.

Macadamization was not introduced into the *streets* of London until about 25 years ago. Before that, it had been carried to what was accounted a great degree of perfection on many of the principal mail and coach roads. Some 50 miles on the Great North Road, or that between London and Carlisle, were often pointed out as an admirable specimen of road-making on Mac Adam's principles. This road was well known in the old coaching days as Leming-lane, running from Boroughbridge to Greta Bridge, in Yorkshire.

The first thoroughfare in London which was macadamized, a word adapted from the name of Sir W. Mac Adam, the originator or great improver of the system, was St. James's-square; after that, some of the smaller streets in the aristocratic parishes of St. James and St. George were thus paved, and then, but not without great opposition, Piccadilly. The opposition to the macadamizing of the latter thoroughfare assumed many forms. Independently of the conflicting statements as to extravagance and economy, it was urged by the opponents, that the dust and dirt of the new style of paving would cause the street to be deserted by the aristocracy—that the noiselessness of the traffic would cause the deaths of the deaf and infirm—that the aristocracy promoted this new-fangled street-making, that they might the better "sleep o' nights," regardless of all else. One writer especially regretted that the Duke of Queensberry, popularly known as "Old Q.," who resided at the western end of Piccadilly, had not lived to enjoy, undisturbed by vulgar noises, his bed of down, until it was his hour to rise and take his bath of perfumed milk! In short, there was all the fuss and absurdity which so often characterise local contests.

The macadamized street is made by a layer of stones, broken small and regular in size, and spread evenly over the road, so that the pressure and friction of the traffic will knead, grind, crush, and knit them into one compact surface. Until road-making became better understood, or until the early part of the present century, the roads even in the suburbs immediately connected with London, such as Islington, Kingsland, Stoke Newington, and Hackney, were "repaired when they wanted it." If there were a "rut," or a hole, it was filled up or covered over with stones, and as the drivers usually avoided such parts, for the sake of their horses' feet, another rut was speedily formed alongside of the original one. Under the old system, road-mending was patch-work; defects were sought to be remedied, but there was little or no knowledge of constructing or of reconstructing the surface as a whole.

The wood pavement came last, and was not established, even partially, until eleven or twelve years ago. One of the earliest places so paved was the Old Bailey, in order that the noise of the street-traffic might be deadened in the Criminal Courts. The same plan was adopted alongside some of the churches, and other public buildings, where external quietude, or, at any rate, diminished noise, was desired. At the first, there were great complaints made, and frequent expostulations addressed to the editors of the newspapers, as to the slipperiness of the wooden ways. The wood pavement is formed of blocks of wood, generally deal, fitted to one another by grooves, by joints, or by shape, for close adjustment. They are placed on the road over a body of concrete, in the same way as granite.

"In constructing roads, or rather streets, through towns or cities, where the amount of traffic is considerable, it will be found desirable," says Mr. Law, in his 'Treatise on the Constructing and Repairing of Roads,' "to pave their surface. The advantages belonging to pavements in such situations over macadamized roads are considerable; where the latter are exposed to an incessant and heavy traffic, their surface becomes rapidly worn, rendering constant repairs requisite, which are not only attended with very heavy expense, but also render the road very unpleasant for being travelled upon while being done; they also require much more attention in the way of scraping or sweeping, and in raking in ruts. And some difficulty would be experienced in towns to find places in which the materials, which would be constantly wanted for repairing the road, could be deposited. In dry weather the macadamized road would always be dusty, and in wet weather it would be covered with mud. The only advantage which such a road really possesses

Original from HARVARD UNIVERSITY

over a pavement is the less noise produced by carriages in passing over it; but this advantage is very small when the pavement is properly laid."

Concerning wood pavements the same gentleman says, "Of late years wood has been introduced as a material for paving streets, and has been rather extensively employed both in Russia and America. It has been tried in various parts of London, and generally with small success, the cause of its failure being identical with the cause of the enormous sums being spent annually in the repairs of the streets generally, namely, the want of a proper foundation; a want which was sooner felt with wood than with granite, in consequence of the less weight and inertia of the wood. The comfort resulting from the use of wooden pavement, both to those who travelled, and those who lived in the streets, from the diminished jolting and noise, was so great, that it is just matter of surprise that so little care was taken in forming that which a very little consideration would have shown to be indispensable to its success, namely, a good foundation. Slipperiness of its surface, in particular states of the weather, was also found to be a disadvantage belonging to wooden pavement; but means might be devised which would render its surface at all times safe, and afford a secure footing for horses. As regards durability, it has scarcely been used for a sufficient period to allow a comparison being made with other materials, but from the result of some observations communicated by Mr. Hope to the Scottish Society of Arts, it appears that wooden blocks when placed with the end of the grain exposed, wear *less than granite*. At first sight, this result might appear questionable, but it is a well-ascertained fact that, where wood and iron move in contact in machinery, the iron generally wears more rapidly than the wood, the reason appearing to be, that the surface of the wood soon becomes covered with particles of dust and grit, which become partially embedded in it, and, while they serve to protect the wood, convert its surface into a species of file, which rapidly wears away whatever it rubs against."

Such then are the different modes of constructing the London roads or streets. I shall now endeavour to show the relative length, and relative cost of the streets thus severally prepared for the commercial, professional, and pleasurable transit of the metropolis.

The comparative extent of the macadamized, of the stone, and of the wood pavement of the streets of the metropolis has not as yet been ascertained, for no general account has appeared condensing the reports, returns, accounts, &c., of the several specific bodies of management into one grand total.

It is, however, possible to arrive at an approximation as to the comparative extent I have spoken of; and in this attempt at approximation, in the absence of all means of a definite statistical computation, I have had the assistance of an experienced and practical surveyor, familiar with the subject.

Macadamization prevails beyond the following boundaries:—

North of the New-road and of its extension, as the City-road, and westward of the New-road's junction with Lisson-grove.

Westward of Park-lane and of the West-end parks.

Eastward of Brick-lane (Spitalfields) and of the Whitechapel High-street.

Southward (on the Surrey side) from the New-cut and Long-lane, Bermondsey, and both in the eastern and western direction of Southwark, Lambeth, and the other southern parishes.

Stone pavement, on the other hand, prevails in the district which may be said to be within this boundary, bearing down upon the Thames in all directions.

It is, doubtlessly, the fact that in both the districts thus indicated exceptions to the general rule may prevail—that in one, for instance, there may be some miles of macadamized way, and in the other some miles of granite pavements; but such exceptions, I am told by a Commissioner of Paving, may fairly be dismissed as balancing each other.

The wooden pavement, I am informed on the same authority, does not now comprise five miles of the London thoroughfares; little notice, therefore, need be taken of it.

The miles of streets in the City in which stone only affords the street medium of locomotion are 50. The stone pavement in the localities outside of this area are six times, or approaching to seven times, the extent of that in the City. I have no actual admeasurement to demonstrate this point, for none exists, and no private individual can offer to measure hundreds of miles of streets in order to ascertain the composition of their surface. But the calculation has been made for me by a gentleman thoroughly conversant with the subject, and well acquainted with the general relative proportion of the defined districts, parishes, and boroughs of the metropolis.

We have thus the following result, as regards the inner police district, or Metropolis Proper:—

	Miles.
Granite paved streets	400
Macadamized ditto (or roads) . . .	1350
Wood ditto	5
Total . . .	1755

This may appear a disproportionate estimate, but when it is remembered that the inner police district of the metropolis extends as far as Hampstead, Tooting, Brentford, and Greenwich, it will be readily perceived that the relative proportions of the macadamized and paved roads are much about the same as is here stated.

As to the cost of these several roads, I will, before entering upon that part of the subject, state the prices of the different materials used in their manufacture.

Aberdeen granite is now 1*l.* 5*s.* per ton, delivered, and prepared for paving, or, as it is often called, "pitching." A ton of "seven inch" granite, that is, granite sunk seven inches in the ground, will cover from two and three-quarters to three square yards, superficial measure, or nine

Original from HARVARD UNIVERSITY

feet per yard. The cost, labour included, is, therefore, from 9*s.* to 12*s.* the square yard. This appears very costly; but in some of the more quiet streets, such as those in the immediate neighbourhood of Golden and Fitzroy-squares, a good granite pavement will endure for 20 years, requiring little repair. In other streets, such as Cheapside, for instance, it lasts from three to four years, without repavement being necessary, supposing the best construction has been originally adopted.

For macadamized streets, where there is a traffic like that of Tottenham Court-road, three layers of small broken granite a year are necessary; the cost of this repavement being about 2*s.* 6*d.* a yard superficial measure. The repairs and relayings on macadamized roads of regular traffic range from 4*s.* to 6*s.* 6*d.* yearly, the square yard.

The wood pavement, which endures, with a trifling outlay for repairs, for about three years, costs, on an average, 11*s.* the square yard.

The concrete used as a foundation in this street-construction costs 4*s.* 6*d.* a cube yard, or 27 feet, by which admeasurement it is always calculated. A cube yard of Thames ballast weighs about 1¼ ton.

The average cost of street-building, new, taking an average breadth, or about ten yards, from footpath to footpath, is then—

	Per Mile. £.	s.	d.
Granite built	96	0	0
Macadamized	44	0	0
Wood	88	0	0

Or, as a total,

	£.	s.	d.
400 miles of granite paved streets at £96 per mile	38,400	0	0
1350 macadamized ditto, at £44 per mile	59,400	0	0
5 wood ditto, at £88 per mile	440	0	0
	98,240	0	0

This, then (about £100,000), is the *original cost* of the roads of the metropolis.

The cost of repairs, &c., annually, is shown by the amount of the paving rate, which may be taken as an average.

	£	s.	d.
400 miles of granite, at 20*s.* per mile	400	0	0
1350 macadamised ditto, at £13 4*s.* per mile	17,820	0	0
5 wood * ditto, at 20*s.* per mile	5	0	0
Total	18,225	0	0

According to a "General Survey of the Metropolitan Highways," by Mr. Thomas Hughes, the principal roads leading out of London are:—

1. *The Cambridge Road,* from Shoreditch through Kingsland.

* This relates merely to the repairs to the wooden pavement, but if a renewal of the blocks be necessary, then the cost approaches that of a new road; and a renewal is considered necessary about once in three years.

2. *The Epping and Chelmsford Roads,* from Whitechapel, through Bow and Stratford.

3. *The Barking Road,* along the Commercial Road past Limehouse.

4. *The Dover Road,* from the Elephant and Castle, across Blackheath.

5. *The Brighton Roads,* (*a*) through Croydon, (*b*) through Sutton.

6. *The Guildford Road,* along the Westminster Road through Battersea and Wandsworth.

7. *The Staines, or Great Western Road,* from Knightsbridge through Brentford.

8. *The Amersham and Aylesbury Road,* along the Harrow Road, and through Harrow-on-the-Hill.

9. *The St. Alban's Road,* along the Edgeware Road through Elstree.

10. *The Oxford Road,* from Bayswater through Ealing.

11. *The Great Holyhead Road.*
12. *The Great North Road.* } From Islington, by and through Barnet.

As to the amount of resistance to traction offered by different kinds of pavement, or the same pavement under different circumstances, the following are the general results of the experiments made by M. Morin, at the expense of the French Government:—

1st. The traction is directly proportional to the load, and inversely proportional to the diameter of the wheel.

2nd. Upon a paved, or hard macadamized road, the resistance is independent of the width of the tire, when it exceeds from three to four inches.

3rd. At a walking pace the traction is the same, under the same circumstances, for carriages with springs and without them.

4th. Upon hard macadamized, and upon paved roads, the traction increases with the velocity: the increments of traction being directly proportional to the increments of velocity above the velocity 3·28 feet per second, or about 2¼ miles per hour. The equal increment of traction thus due to each equal increment of velocity is less as the road is more smooth, and the carriage less rigid or better hung.

5th. Upon soft roads of earth, or sand, or turf, or roads fresh and thickly gravelled, the traction is independent of the velocity.

6th. Upon a well-made and compact pavement of hewn stones, the traction at a walking pace is not more than three-fourths of that upon the best macadamized roads under similar circumstances; at a trotting pace it is equal to it.

7th. The destruction of the road is in all cases greater, as the diameters of the wheels are less, and it is greater in carriages without than with springs.

In Sir H. Parnell's book on roads, p. 73, we are told that Sir John Macneill, by means of an instrument invented by himself for measuring the tractive force required on different kinds of road, obtained the following general results as to the power requisite to move a ton weight under ordinary circumstances, at a very low velocity.

Original from HARVARD UNIVERSITY

Description of Road.	Force, in pounds, required to move a ton.
On a well-made pavement . . .	33
On a road made with six inches of broken stone of great hardness, laid either on a foundation of large stones, set in the form of a pavement, or upon a bottoming of concrete	46
On an old flint road, or a road made with a thick coating of broken stone, laid on earth	65
On a road made with a thick coating of gravel, laid on earth . . .	147

In the same work the relative degrees of resistance to traction on the several kinds of roads are thus expressed :—

On a timber surface	2
On a paved road	2
On a well-made broken stone road, in a dry clean state	5
On a well-made broken stone road, covered with dust	8
On a well-made broken stone road, wet and muddy	10
On a gravel or flint road, in a dry clean state	13
On a gravel or flint road, in a wet muddy state	32

OF THE TRAFFIC OF LONDON.

I HAVE shown (at p. 159, vol. ii.) that the number of miles of streets included in the Inner District of the Metropolitan Police is 1750.

Mr. Peter Cunningham, in his excellent "Handbook of Modern London," tells us that "the streets of the Metropolis, if put together, would measure 3000 miles in length;" but he does not inform us what limits he assigns to the said metropolis; it would seem, however, that he refers to the Outer Police District: and in another place he cites the following as the extent of some of the principal thoroughfares :—

New-road . .	5115 yds. long, or nearly	3 miles.
Oxford-street .	2304 " "	1¼ "
Regent-street .	1730 " "	1 "
Piccadilly . .	1690 "	
City-road . .	1690 "	
Strand . . .	1396 "	

Of the two great lines of streets parallel to the river, the one extending along Oxford-street, Holborn, Cheapside, Cornhill, and Whitechapel to the Regent's-canal, Mile-end, is, says Mr. McCulloch, "above six miles in length;" while that which stretches from Knightsbridge along Piccadilly, the Haymarket, Pall-mall East, the Strand, Fleet-street, Watling-street, Eastcheap, Tower-street, and so on by Ratcliffe-highway to the West India Docks, is, according to the same authority, about equal in length to the other. Mr. Weale asserts, as we have already seen, that the greatest length of street from east to west is about fourteen miles, and from north to south about thirteen miles. The number of streets in London is said to be 10,000, though upon what authority the statement is made, and within what compass it is meant to be applied, I have not been able to ascertain. It is calculated, however, that there are 1900 miles of gas "mains" laid down in London and the suburbs; so that adopting the estimate of the Commissioners of Police, or 1760 miles of streets, within an area of about 90 square miles, we cannot go far wrong.

Now, as to the amount of *traffic* that takes place daily over this vast extent of paved road, it is almost impossible to predicate anything definitely. As yet there are only a few crude facts existing in connection with the subject. All we know is, that the London streets are daily traversed by 1500 omnibuses—such was the number of drivers licensed by the Metropolitan Commissioners in 1850—and about 3000 cabs—the number of drivers licensed in 1850 was 5000, but many "cabs" have a day and night driver as well, and the Return from the Stamp and Tax Office cited below, represents the number of licensed cabriolets, in 1849, at 2846: besides these public conveyances, there are the private carriages and carts, so that the metropolitan vehicles may be said to employ altogether upwards of 20,000 horses.

In the *Morning Chronicle* I said, when treating of the London omnibus-drivers and conductors: —"The average journey, as regards the distance travelled by each omnibus is six miles, and that distance is, in some cases, travelled twelve times a day, or as it is called, 'six there and six back.' Some omnibuses perform the journey only ten times a day, and some, but a minority, a less number of times. Now, taking the average distance travelled by each omnibus at between 45 and 50 miles a day—and this, I am assured, on the best authority, is within the mark, while 60 miles a day might exceed it—and computing the omnibuses running daily at 1500, we find 'a travel,' as it was worded to me, of upwards of 70,000 miles daily, or a yearly 'travel' of more than 25,000,000 miles; an extent which is upwards of a thousand times more than the circumference of the earth; and that this estimate in no way exceeds the truth is proved by the sum annually paid to the Excise for 'mileage,' which amounts on an average to 9*l.* each 'bus' per month, or collectively to 162,000*l.* per annum, and this, at 1½*d.* per mile (the rate of duty charged), gives 25,920,000 miles as the aggregate distance travelled by the entire number of omnibuses every year through the London streets."

The distance travelled by the London cabs may be estimated as follows:—Each driver may be said to receive on an average 10*s.* a day all the year through. Now, the number of licences prove that there are 5000 cab-drivers in London, and as each of these must travel at the least ten miles in order to obtain the daily 10*s.*, we may safely assert that the whole 5000 go over 50,000 miles of ground a day, or, in round numbers, 18,250,000 miles in the course of the year.

According to a return obtained by Mr. Charles Cochrane from the Stamp and Tax Office, Somerset House, there were in the metropolis, in 1849–50, the following number of horses:—

Private carriage, job, and cart horses (in London)	3,683
Ditto (in Westminster)	6,339
Cabriolets licensed 2846 (having two horses each)	5,692
Omnibuses licensed 1350 (four horses each)	5,500
Total number of horses in the metropolis	21,214

I am assured, by persons well acquainted with the omnibus trade, that the number of omnibus horses here cited is far too low—as many proprietors employ ten horses to each "bus," and none less than six. Hence we may fairly assume that there are at the least 25,000 horses at work every day in the streets of London. Besides the horses above mentioned, it is estimated that the number daily coming to the metropolis from the surrounding parts is 3000; and calculating that each of the 25,000, which may be said to be at work out of the entire number, travels eight miles a day, the aggregate length of ground gone over by the whole would amount to 200,000 miles per diem, or about 70,000,000 miles throughout the year. There are, as we have seen, upwards of 1750 miles of streets in London. It follows, therefore, that each piece of pavement would be traversed no less than 40,000 times per annum, or upwards of a hundred times a day, by some horse or vehicle.

As I said before, the facts that have been collected concerning the absolute traffic of the several parts of London are of the most meagre description. The only observations of any character that have been made upon the subject are—as far as my knowledge goes—those of M. D'Arcey, which are contained in a French report upon the roads of London, as compared with those of Paris.

This gentleman, speaking of the relative number of vehicles passing and repassing over certain parts of the two capitals, says:—"The Boulevards of Paris are the parts where the greatest traffic takes place. On the *Boulevard des Capucins* there pass, every 24 hours, 9070 horses drawing carriages; on the *Boulevard des Italiens*, 10,750; *Boulevard Poissonière*, 7720; *Boulevard St. Denis*, 9609; *Boulevard des Filles du Calvaire*, 5856: general average of the above, 8600. *Rue du Faubourg St. Antoine*, 4300; *Avenue des Champs Elysées*, 8959. At London, in Pall Mall, opposite Her Majesty's Theatre, there pass at least 800 carriages every hour. On London-bridge the number of vehicles passing and repassing is not less than 13,000 every hour. On Westminster-bridge the annual traffic amounts to 8,000,000 horses at the least. By this it will be seen that the traffic in Paris does not amount to one half of what it is in the streets of London."

Of the Dust and Dirt of the Streets of London.

We have merely to reflect upon the vast amount of traffic just shown to be daily going on throughout London—to think of the 70,000,000 miles of journey through the metropolis annually performed by the entire vehicles (which is more than two-thirds the distance from the earth to the sun)—to bear in mind that each part of London is on the average gone over and over again 40,000 times in the course of the year, and some parts as many as 13,000 times in a day—and that every horse and vehicle by which the streets are traversed are furnished, the one with four iron-bound hoofs, and the other with iron-bound wheels—to have an imperfect idea of the enormous weights and friction continually operating upon the surface of the streets—as well as the amount of grinding and pulverising, and wear and tear, that must be perpetually taking place in the paving-stones and macadamized roads of London; and thus we may be able to form some mental estimate as to the quantity of dust and dirt annually produced by these means alone.

But the table in pp. 186–7, which has been collected at great trouble, will give us still more accurate notions on the subject. It is not given as perfect, but as being the best information, in the absence of positive returns, that was procurable even from the best informed.

Here, then, we have an aggregate total of dust collected from the *principal* parts of the metropolis amounting to no less than 141,466 loads. The value of this refuse is said to be as much as 21,221*l.* 8*s.*, but of this and more I shall speak hereafter. At present I merely seek to give the reader a general notion upon the matter. I wish to show him, before treating of the labourers engaged in the scavenging of the London streets, the amount of work they have to do.

Of the Street-Dust of London, and the Loss and Injury Occasioned by It.

The daily and nightly grinding of thousands of wheels, the iron friction of so many horses' hoofs, the evacuations of horses and cattle, and the ceaseless motion of pedestrians, all decomposing the substance of our streets and roads, give rise to many distinct kinds of street-dirt. These are severally known as

(1) *Dust.*

(2) *Horse-dung* and *cattle-manure.*

(3) *Mud,* when mixed with water and with general refuse, such as the remains of fruit and other things thrown into the street and swept together.

(4) *Surface-water* when mixed with street-sewage.

These productions I shall treat severally, and first of the street-dust.

The "*detritus*" of the streets of London assumes many forms, and is known by many names, according as it is combined with more or less water.

	Scavengers' Total	358	531	130	183	355½	548½	140,983	21,147	9	0

Average total	444½ men.	156½ carts.	452 loads daily.	140,983 loads yearly.	£21,147 9 0
Orderlies	546 ditto.		9 ditto.	2,817 ditto.	352 2 6
Gross total	990½ men.	156½	461 loads daily.	143,800 loads yearly.	£21,499 11 6

1st. In a perfectly dry state, so that the particles no longer exist either in a state of cohesion or aggregation, but are minutely divided and distinct, it is known by the name of "dust."

2nd. When in combination with a small quantity of water, so that it assumes the consistency of a pap, the particles being neither free to move nor yet able to resist pressure, the detritus is known by the name of "mac mud," or simply "mud," according as it proceeds from a macadamized or stone paved road.

3rd. When in combination with a greater quantity of water, so that it is rendered almost liquid, it is known as "slop-dirt."

4th. When in combination with a still greater quantity of water, so that it is capable of running off into the sewers, it is known by the name of "street surface-water."

The mud of the streets of London is then merely the dust or detritus of the granite of which they are composed, agglutinated either with rain or the water from the watering-carts. Granite consists of silex, felspar, and mica. Silex is sand, while felspar and mica are also silex in combination with alumina (clay), and either potash or magnesia. Hence it would appear to be owing to the affinity of the alumina or clay for moisture, as well as the property of silex to "gelatinize" with water under certain conditions, that the particles of dry dust derive their property of *agglutinating*, when wetted, and so forming what is termed "mud"—either "mac," or simple mud, according, as I said before, to the nature of the paving on which it is formed.

By *dust* the street-cleansers mean the collection of every kind of refuse in the dust-bins; but I here speak, of course, of the fine particles of earthy matter produced by the attrition of our roads when in a dry state. Street-dust is, more properly speaking, mud deprived of its moisture by evaporation. Miss Landon (L. E. L.) used to describe the London dust as "mud in high spirits," and perhaps no figure of speech could convey a better notion of its character.

In some parts of the suburbs on windy days London is a perfect dust-mill, and although the dust may be allayed by the agency of the water-carts (by which means it is again converted into "mac," or mud), it is not often thoroughly allayed, and is a source of considerable loss, labour, and annoyance. Street-dust is not collected for any useful purpose, so that as there is no return to be balanced against its prejudicial effects it remains only to calculate the quantity of it annually produced, and thus to arrive at the extent of the mischief.

Street-dust is disintegrated granite, that is, pulverized quartz and felspar, felspar being principally composed of alumina or clay, and quartz silex or sand; it is the result of the attrition, or in a word it is the *detritus*, of the stones used in pavements and in macadamization; it is further composed of the pulverization of all horse and cattle-dung, and of the almost imperceptible, but still, I am assured, existent powder which arises from the friction of the wooden pavement even when kept moist. In the roads of the nearest suburbs, even around such places as the Regent's-park, at many seasons this dust is produced largely, so that very often an open window for the enjoyment of fresh air is one for the intrusion of fresh dust. This may be less the case in the busier and more frequently-watered thoroughfares, but even there the annoyance is great.

I find in the "Reports" in which this subject is mentioned but little said concerning the influence of dust upon the public health. Dr. Arnott, however, is very explicit on the subject. "It is," says he, "scarcely conceivable that the immense quantities of granite dust, pounded by one or two hundred thousand pairs of wheels (!) working on macadamized streets, should not greatly injure the public health. In houses bordering such streets or roads it is found that, notwithstanding the practice of watering, the furniture is often covered with dust, even more than once in the day, so that writing on it with the finger becomes legible, and the lungs and air tubes of the inhabitants, with a moist lining to detain the dust, are constantly pumping in the same atmosphere. The passengers by a stage-coach in dry weather, when the wind is moving with them so as to keep them enveloped in the cloud of dust raised by the horses' feet and the wheels of the coach, have their clothes soon saturated to whiteness, and their lungs are charged in a corresponding degree. A gentleman who rode only 20 miles in this way had afterwards to cough and expectorate for ten days to clear his chest again."

In order that the deleteriousness to health incident to the inhalation of these fine and offensive particles may be the better estimated, I may add, that in every 24 hours an adult breathes 36 hogsheads of air; and Mr. Erasmus Wilson, in his admirable work on the Skin, has the following passage concerning the extent of surface presented by the lungs:—

"The lungs receive the atmospheric air through the windpipe. At the root of the neck the windpipe, or trachea, divides into two branches, called bronchi, and each bronchus, upon entering its respective lung, divides into an infinity of small tubes; the latter terminate in small pouches, called air-cells, and a number of these little air-cells communicate together at the extremity of each small tube. The number of air-cells in the two lungs has been estimated at 1,744,000,000, and the extent of the skin which lines the cells and tubes together at 1500 square feet. This calculation of the number of air-cells, and the extent of the lining membrane, rests, I believe, on the authority of Dr. Addison of Malvern."

What is the amount of atmospherical granite, dung, and refuse-dust received in a given period into the human lungs, has never, I am informed, been ascertained even by approximation; but according to the above facts it must be something fearful to contemplate.

After this brief recital of what is known concerning the sanitary part of the question, I proceed to consider the damage and loss occasioned by street-

Original from HARVARD UNIVERSITY

dust. In no one respect, perhaps, can this be ascertained with perfect precision, but still even a rough approximation to the extent of the evil is of value, as giving us more definite ideas on the subject.

It will be seen, on reference to the preceding table, that the quantity of street-refuse collected in dry weather throughout the metropolis is between 300 and 400 cart-loads daily, or upwards of 100,000 cart-loads, the greater proportion of which may be termed street-dust.

The damage occasioned by the street-dust arises from its penetrating, before removal, the atmosphere both without and within our houses, and consists in the soiling of wearing apparel, the injury of the stock-in-trade of shopkeepers, and of household furniture.

Washing is, of course, dependent upon the duration of time in which it is proper, in the estimation of the several classes of society, to retain wearing apparel upon the person, on the bed or the table, without what is termed a "change;" and this duration of time with thousands of both men and women is often determined by the presence or absence of dirt on the garment; and not arbitrarily, as among wealthier people, with whom a clean shirt every morning, and a clean table-cloth every one, two, three, or more days, as may happen, are regarded as things of course, no matter what may be the state of the displaced linen.

The Board of Health, in one of their Reports, speak very decisively and definitely on this subject. "Common observation of the rate at which the skin, linen, and clothes (not to speak of paper, books, prints, and furniture) become dirty in the metropolis," say they, "as compared with the time that elapses before a proportionate amount of deterioration and uncleanliness is communicated in the rural districts, will warrant the estimate, that *full one-half the expense of washing to maintain a passable degree of cleanliness*, is rendered necessary by the excess of smoke generated in open fires, and the *excess of dust arising from the imperfect scavenging of the roads and streets*. Persons engaged in washing linen on a large scale, state that it is dirtied in the crowded parts of the metropolis in *one-third* the time in which the like degree of uncleanliness would be produced in a rural district; but all attest the fact, that linen is more rapidly destroyed by washing than by the wear on the person. The expense of the more rapid destruction of linen must be added to the extra expense of washing. These expenses and inconveniences, the greater portion of which are due to *local maladministration, occasion an extra expenditure of upwards of two to three millions per annum*—exclusive of the injury done to the general health and the medical and other expenses consequent thereon."

Here, then, we find the evil effects of the imperfect scavenging of the metropolis estimated at between two and three millions sterling per annum, and this in the mere matter of extra washing and its necessary concomitant extra wear and tear of clothes.

As this estimate, however, appears to me to exaggerate the evil beyond all due bounds, I will proceed to adduce a few facts, bearing upon the point: and first as to the expense of washing.

In order to ascertain as accurately as possible, the actual washing expenses of labouring men and their families whose washing was done at home, Mr. John Bullar, the Honorary Secretary to the Association for the Promotion of Baths and Wash-houses, tells us in a Report presented to Parliament, "that inquiries were made of several hundred families of labouring men, and it was found that, *taking the wife's labour as worth 5s. a week!* the total cost of washing at home, for a man and wife and four children, averaged very closely on 2*s*. 6*d*. a week, = 5*d*. a head. The cost of coals, soda, soap, starch, blue, and sometimes water, was rather less than one-third of the amount. The time occupied was rarely less than two days, and more often extended into a third day, so that the value of the labour was rather more than two-thirds of the amount.

"The cost of washing to single men among the labouring classes, whose washing expenditure might be expected to be on a very low scale, such as hod-men and street-sweepers, was found to be 4½*d*. a head.

"The cost of washing to very small tradesmen could not be safely estimated at much more than 6*d*. a head a week.

"It may, perhaps," continues the Report, "be safe to reckon the weekly washing expenses of the poorer half of the inhabitants of the metropolis at not exceeding 6*d*. a head; but the expenditure for washing rapidly increases as the inquiry ascends into what are called the 'middle classes.'

"The washing expenses of families in which servants are employed may be considered as double that of the servants', and, therefore, as ranging from 1*s*. 6*d*. to 5*s*. a week a head.

"There is considerable difficulty in ascertaining with any exactness the washing expenditure of private families, but the conclusion is that, taking the whole population, the washing bills of London are nearly 1*s*. a week a head, or 5,000,000*l*. a year.

"Of course," adds Mr. Bullar, "I give this as but a rough estimate, and many exceptions may easily be taken to it; but I feel pretty confident that *it is not very far* from the truth."

As I before stated, I am in no way disposed to go to the extent of the calculation here made. It appears to me that in parliamentary investigations by the agency of select committees, or by gentlemen appointed to report on any subject, there is an aptitude to deal with the whole body of the people as if they were earning the wages of well and regularly-employed labourers, or even mechanics. To suppose that the starving ballast-heaver, the victim of a vicious truck system, which condemns him to poverty and drunkenness, or the sweep, or the dustman, or the street-seller, all very numerous classes expends 1*s*. a week in his washing, is far beyond the fact. Still less is expended in the washing of these people's children. Even the well-conducted artizan, with two clean shirts a week

(costing him 6*d*.), with the washing of stockings, &c. (costing 1*d*. or 2*d*.), does not expend 1*s*. a week; so that, though the washing bills of many ladies and of some gentlemen may average 10*s*. weekly, if we consider how few are rich and how many poor, the extra payment seems insufficient to make up the average of the weekly shilling for the washing of all classes.

A prosperous and respectable master greengrocer, who was what may be called "particular" in his dress, as he had been a gentleman's servant, and was now in the habit of waiting upon the wealthy persons in his neighbourhood, told me that the following was the average of his washing bill. He was a bachelor; all his washing was put out, and he considered his expenditure far *above* the average of his class, as many used no night-shirt, but slept in the shirts they wore during the day, and paid only 3*d*., and even less, per shirt to their washer-woman, and perhaps, and more especially in winter, made one shirt last the week.

Two shirts (per week) . .	7*d*.
Stockings	1
Night-shirt (worn two weeks generally, average per week) .	0¾
Sheets, blankets, and other household linens or woollens . .	2
Handkerchiefs	0¼
	11*d*.

My informant was satisfied that he had put his expenditure at the highest. I also ascertained that an industrious wife, who was able to attend to her household matters, could wash the clothes of a small tradesman's family,—for a man, his wife, and four small children,—"well," at the following rate:—

1 lb. soap	4½*d*. or 5*d*.
Soda and starch . .	0½
½ cwt. coals (extra) . .	3½
	8½*d*.

or less than 1½*d*. per head.

In this calculation it will be seen the cheapest soap is reckoned, and that *there is no allowance for the wife's labour*. When I pointed out the latter circumstance, my informant said: "I look on it that the washing labour is part of the wife's keep, or what she gives in return for it; and that as she'd have to be kept if she didn't do it, why there shouldn't be no mention of it. If she was working for others it would be quite different, but washing is a family matter; that's my way of looking at it. Coke, too, is often used instead of coals; besides, a bit of bacon, or potatoes, or the tea-kettle, will have to be boiled, and that's managed along with the hot water for the suds, and would have to be done anyhow, especially in winter."

One decent woman, who had five children, "all under eight," told me she often sat up half, and sometimes the whole night to wash, when busy other ways. She was not in poverty, for she earned "a good bit" in going out to cook, and her husband was employed by a pork-butcher.

I may further add, that a great many single men wash their own clothes. Many of the street-sellers in particular do this; so do such of the poor as live in their own rooms, and occasionally the dwellers in the low lodging-houses. One street-seller of ham sandwiches, whose aprons, sleeves, and tray-cloth, were remarkably white, told me that he washed them himself, as well as his shirt, &c., and that it was the common practice with his class. This washing—his aprons, tray-cloths, shirts, and stockings included—cost him, every three weeks, 4½*d*. or 5*d*. for 1 lb. of soap, which is less than 1½*d*. a week. Among such people it is considered that the washing of a shirt is, as they say, "a penn'orth of soap, and the stockings in," meaning that a penny outlay is sufficient to wash for both.

But not only does Mr. Bullar's estimate exceed the truth as regards the cost of washing among the poorer classes, but it also errs in the proportion they are said to bear to the other ranks of society. That gentleman speaks of "the poorer *half* of the inhabitants of the metropolis," as if the rich and poor were equal in numbers! but with all deference, it will be found that the ratio between the well-to-do and the needy is as 1 to 2, that is to say, the property and income-tax returns teach us there are at least two persons with an income *below* 150*l*. per annum, to every one having an income *above* it. Hence, the population of London being, within a fraction, 2,400,000; the numbers of the metropolitan well-to-do and needy would be respectively 800,000 and 1,600,000, and, allowing the cost of the washing of the former to average 1*s*. per head (adults and children), and, the washing of the labouring classes to come to 2*d*. a head, young and old (the expense of the materials, when the work is done at home, average, it has been shown, about 1½*d*. for each member of the family), we shall then have the following statement:—

Annual cost of washing for 800,000 people, at 1*s*. per head per week .	£2,080,000
Annual cost of washing for 1,600,000 people, at 2*d*. per head per week .	693,333
Total cost of washing of metropolis	£2,773,333

I am convinced, low as the estimate of 2*d*. a week may appear for all whose incomes are under 150*l*. a year, from many considerations, that the above computation is rather over than under the truth. As, for instance, Mr. Hawes has said concerning the consumption of soap in the metropolis, — "Careful inquiry has proved that the quantity used is much greater than that indicated by the Excise returns; but reducing the results obtained by inquiry in one uniform proportion, the quantity used by the labouring classes earning from 10*s*. to 30*s*. per week is 10 lbs. each per annum, including every member of the family. Dividing the population of the metropolis into three classes: (1) the wealthy; (2) the shopkeepers and tradesmen; (3) labourers and the poor, and allowing 15 lbs., 10 lbs., and 4 lbs. to

Original from
HARVARD UNIVERSITY

each respectively, the consumption of the metropolis will be nearly 200 tons per week." The cost of each ton of soap Mr. Hawes estimates at 45*l.*

Professor Clarke, however, computes the metropolitan consumption of soap at 250 tons per week, and the cost per ton at 50*l.*

According to the above estimates, the total quantity of soap used every year in the metropolis is 12,000 tons, and this, at 50*l.* per ton, comes to .	£600,000
Professor Clarke reckons the gross consumption of soda in the metropolis, at 250 tons per month, costing 10*l.* a ton; hence for the year the consumption will be 3000 tons, costing	30,000
The cost of water, according to the same authority, is 3*s.* 4*d.* per head per annum, and this, for the whole metropolis, amounts to	400,000
Estimating the cost of the coals used in heating the water to be equal to that of the soap, we have for the gross expense of fuel annually consumed in washing	600,000
There are 21,000 laundresses in London, and, calculating that the wages of these average 10*s.* a week each all the year round, the gross sum paid to them, would be in round numbers	550,000
Profit of employers, say	550,000
Add for sundries, as starch, &c. .	50,000
Total cost of washing of metropolis	£2,780,000

Hence it would appear, that viewed either by the individual expense of the great bulk of society, or else by the aggregate cost of the materials and labour used in cleansing the clothes of the people of London, the total sum annually expended in the washing of the metropolis may be estimated at the outside at two millions and three quarters sterling per annum, or about 1*l.* 3*s.* 4*d.* per head.

And yet, though the data for the calculation here given, as to the cost and quantity of the principal materials used in cleansing the clothes of London, are derived from the same Report as that in which the expense of the metropolitan washing is estimated at 5,000,000*l.* per annum, the Board of Health do not hesitate in that document to say that,—"Of the fairness of the estimate of the expense of washing to the higher and middle classes, and to the great bulk of the householders, and the better class of artizans, we entertain no doubt whatever. Whatsoever deductions, if any, may be made from the above estimate, it is, nevertheless, an *under-estimate* for maintaining, at the present expense of washing, a proper amount of cleanliness in linen."

Proceeding, however, with the calculation as to the loss from the imperfect scavenging of the metropolis, we have the following results:—

LOSS FROM DUST AND DIRT IN THE STREETS OF THE METROPOLIS, OWING TO THE EXTRA WASHING ENTAILED THEREBY.

According to the Board of Health, taking the yearly amount of the washing of the metropolis at 5,000,000*l.*, and assuming the washing to be doubled by street-dirt, the loss will be	£2,500,000
Calculating the washing, however, for reasons above adduced, to be only 2,750,000*l.*, and to be as much again as it might be under an improved system of scavenging, the loss will be	1,375,000
Or calculating, *as a minimum*, that the remediable loss is less than one-half, the cost is	£1,000,000

Hence it would appear that the loss from dust and dirt is *really enormous.*

In a work entitled "Sanatory Progress," being the Fifth Report of the National Philanthropic Association, I find a calculation as to the losses sustained from dust and dirt upon our clothes. Owing to the increased wear from daily brushing to remove the dust, and occasional scraping to remove the mud, the loss is estimated at from 3*l.* to 7*l.* per annum for each well-dressed man and woman, and 1*l.* for inferiorly-dressed persons, including their Sunday and holiday clothing.

I inquired of a West-end tailor, who previously to his establishment in business had himself been an operative, and had had experience both in town and country as to the wear of clothes, and I learned from him the following particulars.

With regard to the clothes of the wealthy classes, of those who could always command a carriage in bad weather, there are no means of judging as to the loss caused by bad scavengery.

My informant, however, obliged me with the following calculations, the results of his experience. His trade is what I may describe as a medium business, between the low slop and the high fashionable trades. The garments of which he spoke were those worn by clerks, shopmen, students, tradesmen, town-travellers, and others not engaged in menial or handicraft labour.

Altogether, and after consulting his books relative to town and country customers, my informant thought it might be easy to substantiate the following estimate as regards the duration and cost of clothes in town and country among the classes I have specified.

TABLE SHOWING THE COMPARATIVE COST OF CLOTHES WORN IN TOWN AND COUNTRY.

Garments.	Original cost.	Town.		Country.		Difference of cost.
		Duration.	Annual cost.	Duration.	Annual cost.	
	£ s. d.	Years.	£ s. d.	Years.	£ s. d.	£ s. d.
Coat . .	2 10 0	2	1 5 0	3	0 16 8	0 8 4
Waistcoat .	0 15 0	2½	0 6 0	3	0 5 0	0 1 0
Trowsers . .	1 5 0	1¼	1 0 0	2	0 12 6	0 7 6
Total Suit.	4 10 0		2 11 0		1 14 2	0 16 10

Here, then, it appears that the annual outlay for clothes in town, by the classes I have specified, is about 2*l.* 11*s.*; while the annual outlay in the country for the same garments is 1*l.* 14*s.* 2*d.*; the difference of expense being 16*s.* 10*d.* per annum. I consulted another tailor on the subject, and his estimate was a trifle above that of my informant.

I should remark that the proportion thus adduced holds, *whatever be the number of garments* worn in the year, or in a series of years, for the calculation was made not as to individual garments, but as to the general wear, evinced by the average outlay, as shown in the tradesman's books, of the same class of persons in town and country.

In the calculation given in the publication of the National Philanthropic Association, the loss on a well-dressed Londoner's clothing, arising from excessive dust and dirt, is estimated at from 3*l.* to 7*l.* per annum. By the above table it will be seen that the clothes which cost 1*l.* 14*s.* 2*d.* per annum in the cleanliness of a country abode, cost 2*l.* 11*s.*, or, within a fraction, half as much again, in the uncleanliness of a London atmosphere and roads. If, therefore, any London inhabitant, of the classes I have specified, expend four times 2*l.* 11*s.* in his clothes yearly, as many do, or 10*l.* 4*s.*, he loses 3*l.* 5*s.* 4*d.*, or 5*s.* 4*d.* more than the minimum mentioned in the Report alluded to.

Now estimating 2*l.* 10*s.* as the yearly tailor's bill among the well-to-do (boys and men), and calculating that one-sixth of the metropolitan population (that is, half of the one-third who may be said to belong to the class having incomes above 150*l.* a year) spend this sum yearly in clothes, we have the following statement:—

AGGREGATE LOSS UPON CLOTHES WORN IN LONDON.

	£	s.	d.
400,000 persons living in London expend in clothing (at 2*l.* 10*s.* per annum)	1,000,000	0	0
400,000 persons living in better atmospheres in rural parts, and with the same stock of clothes, expend one-third less, or	666,666	13	4
Difference	333,333	6	8

It would be pushing the inquiry to exceeding minuteness were I to enter into calculations as to the comparative expense of boots, hats, and ladies' dresses worn in town and country; suffice it, that competent persons in each of the vestiary trades have been seen, and averages drawn for the accounts of their town and country customers.

All things, then, being duly considered, the following conclusion would seem to be warranted by the facts:—

Annual cost of clothes to 800,000 of the metropolitan population (those belonging to the class who have incomes *above* 150*l.* per annum) at 4*l.* per year each	£3,200,000
Annual cost of clothes to 1,600,000 of the metropolitan population (those belonging to the class who have incomes *below* 150*l.* per annum), at 1*l.* per year each	1,600,000
	£4,800,000
Annual cost of the same clothes if worn in the country	3,600,000
Extra expense annually entailed by dust and dirt of metropolis . . .	£1,200,000

In the above estimate I have included the cost of wear and tear of linen from extra washing when worn in London, and this has been stated on the authority of the Board of Health to be double that of linen worn in the country.

In connection with this subject I may cite the following curious calculation, taken from a Parliamentary Report, as to the cost of a working man's new shirt, comprising four yards of strong calico.

	d.	d.
Material.—Cotton at 6*d.* per lb. 1¼ lb., with loss thereupon		8·25
Manufacture,—		
Spinning	2·25	
Weaving	3·00	
Profit	·25	
		5·50
		13·75
Bleaching about .		1·25
		15·00

Grey (calico) 13·75*d.*+9*d.* (making) = 1*s.* 10¾*d.*
Bleached . . 15*d.* +9*d.* „ = 2*s.*

As regards the loss and damage occasioned by the injury to household furniture and decorations, and to stocks-in-trade, which is another important consideration connected with this subject, I find the following statement in the Report of the Philanthropic Institution:—"The loss by goods and furniture is incalculable: shopkeepers lose from 10*l.* to 150*l.* a-year by the spoiling of their goods for sale; dealers in provisions especially, who cannot expose them without being deteriorated in value, from the dust that is incessantly settling upon them. Nor is it much better with clothiers of all kinds:—Mr. Holmes, shawl merchant, in Regent-street, has stated that his losses from road-dust alone exceed 150*l.* per annum." . . . . "In a communication with Mr. Mivart, respecting the expenses of mud and road-dust to him, that gentleman stated that the rent of the four houses of which his hotel is composed, was 896*l.*; and that he could not (considering the cost of cleaning and servants) estimate the expense of repairing the damage done by the dirt and dust, carried and blown into these houses, at a less annual sum than that of his rent!"

An upholsterer obliged me with the following calculations, but so many were the materials, and so different the rates of wear or the liability to injury in different materials in his trade, that he could only calculate generally.

The same quality, colour, and pattern of curtains, silk damasks, which he had furnished to a house in town, and to a country house belonging to the same gentleman, looked far fresher and better after five years' wear in the country than after three in town. Both windows had a southern aspect, but the occupant would have his windows partially open unless the weather was cold, foggy, or rainy. It was the same, or nearly the same, he thought, with the carpets on the two places, for London dust was highly injurious to all the better qualities of carpets. He was satisfied, also, it was the same generally in upholstery work subjected to town dust.

I inquired at several West-end and city shops, and of different descriptions of tradesmen, of the injury done to their shop and shop-window goods by the dust, but I found none who had made any calculations on the subject. All, however, agreed that the dust was an excessive annoyance, and entailed great expense; a ladies' shoemaker and a bookseller expressed this particularly—on the necessity of making the window a sort of small glass-house to exclude the dust, which, after all, was not sufficiently excluded. All thought, or with but one hesitating exception, that the estimation as to the loss sustained by the Messrs. Holmes, considering the extent of their premises, and the richness of the goods displayed in the windows, &c., was not in excess.

I can, then, but indicate the injury to household furniture and stock-in-trade as a corroboration of all that has been advanced touching the damaging effects of road dirt.

Of the Horse-Dung of the Streets of London.

"Familiarity with streets of crowded traffic deadens the senses to the perception of their actual condition. Strangers coming from the country frequently describe the streets of London as smelling of dung like a stable-yard."

Such is one of the statements in a Report submitted to Parliament, and there is no reason to doubt the fact. Every English visitor to a French city, for instance, must have detected street-odours of which the inhabitants were utterly unconscious. In a work which between 20 and 30 years ago was deservedly popular, Mathews's "Diary of an Invalid," it is mentioned that an English lady complaining of the villanous rankness of the air in the first French town she entered—Calais, if I remember rightly—received the comfortable assurance, "It is the smell of the Continent, ma'am." Even in Cologne, itself, the "most stinking city of Europe," as it has been termed, the citizens are insensible to the foul airs of their streets, and yet possess great skill in manufacturing perfumed and distilled waters for the toilet, pluming themselves on the delicacy and discrimination of their nasal organs. What we perceive in other cities, as strangers, those who visit London detect in our streets—that they smell of dung like stable-yards. It is idle for London denizens, because they are unconscious of the fact, to deny the existence of any such effluvia. I have met with nightmen who have told me that there was "nothing particular" in the smell of the cesspools they were emptying; they "hardly perceived it." One man said, "Why, it's like the sort of stuff I've smelt in them ladies' smelling-bottles." An eminent tallow-melter said, in the course of his evidence before Parliament during a sanitary inquiry, that the smell from the tallow-melting on his premises was not only healthful and reviving—for invalids came to inhale it—but agreeable. I mention these facts to meet the scepticism which the official assertion as to the stable-like odour of the streets may, perhaps, provoke. When, however, I state the *quantity* of horse-dung and "cattle-droppings" voided in the streets, all incredulity, I doubt not, will be removed.

"It has been ascertained," says the Report of the National Philanthropic Association, "that four-fifths of the street-dirt consist of horse and cattle-droppings."

Let us, therefore, endeavour to arrive at definite notions as to the absolute quantity of this element of street-dirt.

And, first, as to the number of cattle and horses traversing the streets of London.

In the course of an inquiry in November, 1850, into Smithfield-market, I adduced the following results as to the number of cattle entering the metropolis, deriving the information from the experience of Mr. Deputy Hicks, confirmed by returns to Parliament, by the amount of tolls, and further ratified by the opinion of some of the most experienced "live salesmen" and "dead

Digitized by Google Original from HARVARD UNIVERSITY

salesmen" (sellers on commission of live and dead cattle), whose assistance I had the pleasure of obtaining.

The return is of the stock *annually* sold in Smithfield-market, and includes not only English but foreign beasts, sheep, and calves; the latter averaging weekly in 1848 (the latest return then published), beasts, 590; sheep, 2478; and calves, 248.

224,000 horned cattle.
1,550,000 sheep.
27,300 calves.
40,000 pigs.

Total . . 1,841,300.

I may remark that this is not a criterion of the consumption of animal food in the metropolis, for there are, besides the above, the daily supplies from the country to the "dead salesmen." The preceding return, however, is sufficient for my present purpose, which is to show the quantity of cattle manure "dropped" in London.

The number of cattle entering the metropolis, then, are 1,841,300 per annum.

The number of horses daily traversing the metropolis has been already set forth. By a return obtained by Mr. Charles Cochrane from the Stamp and Tax Office, we have seen that there are altogether

In London and Westminster, of private carriage, job, and cart horses . . .	10,022
Cab horses	5,692
Omnibus horses	5,500
Horses daily coming to metropolis . .	3,000
Total number of horses daily in London	24,214

The total here given includes the returns of horses which were either taxed or the property of those who employ them in hackney-carriages in the metropolis. But the whole of these 24,214 horses are not at work in the streets every day. Perhaps it might be an approximation to the truth, if we reckoned five-sixths of the horses as being worked regularly in the public thoroughfares; so that we arrive at the conclusion that 20,000 horses are daily worked in the metropolis; and hence we have an aggregate of 7,300,000 horses traversing the streets of London in the twelvemonth. The beasts, sheep, calves, and pigs driven and conveyed to and from Smithfield are, we have seen, 1,841,300 in number. These, added together, make up a total of 9,141,300 animals appearing annually in the London thoroughfares. The circumstance of Smithfield cattle-market being held but twice a week in no way detracts from the amount here given; for as the gross number of individual cattle coming to that market in the course of the year is given, each animal is estimated as appearing only once in the metropolis.

The next point for consideration is—what is the quantity of dung dropped by each of the above animals while in the public thoroughfares?

Concerning the quantity of excretions passed by a horse in the course of 24 hours there have been some valuable experiments made by philosophers whose names alone are a sufficient guarantee for the accuracy of their researches.

The following Table from Boussingault's experiments is copied from the "Annales de Chimie et de Physique," t. lxxi.

FOOD CONSUMED BY AND EXCRETIONS OF A HORSE IN TWENTY-FOUR HOURS.

Food.			Excretions.		
	Weight in a fresh state in grammes.	Weight in a fresh state in pounds.		Weight in a fresh state in grammes.	Weight in a fresh state in pounds.
		lbs. oz.			lbs. oz.
Hay . . .	7,500	20 0	Excrements .	14,250	38 2
Oats . . .	2,270	6 1	Urine . . .	1,330	3 7
	9,770	26 1			
Water . . .	16,000	42 10			
Total . .	25,770	68 11	Total . . .	15,580	41 9

Here it will be seen that the quantity of solid food given to the horse in the course of the 24 hours amounted only to 26 lbs.; whereas it is stated in the Report of the National Philanthropic Association, on the authority of the veterinary surgeon to the Life Guards, that the regulation horse rations in all cavalry regiments is 30 lbs. of solid food; viz., 10 lbs. of oats, 12 lbs. of hay, together with 8 lbs. of straw, for the horse to lie upon and munch at his leisure. "This quantity of solid food, with five gallons of water is considered sufficient," we are told, "for all regimental horses, who have but little work to perform, in comparison with the draught horses of the metropolis, many of which consume daily 35 lbs. and upwards of solid food, with at least six gallons of water.

"At a conference held with the secretary and professors of the Veterinary College in College-street, Camden-town," continues the Report,

"those gentlemen kindly undertook to institute a series of experiments in this department of equine physiology; the subject being one which interested themselves, professionally, as well as the council of the National Philanthropic Association. The experiments were carefully conducted under the superintendence of Professor Varnell. The food, drink, and voidances of several horses, kept in stable all day long, were separately weighed and measured; and the following were the results with an animal of medium size and sound health:—

"'Royal Veterinary College, Sept. 29, 1849.

"'Brown horse of middle size ate in 24 hours, of hay, 16 lbs.; oats, 10 lbs.; chaff, 4 lbs.; in all	30 lbs.
Drank of water, in 24 hours, 6 gallons, or	48 lbs.
Total . . .	78 lbs.
Voided in the form of fæces . . .	49 lbs.
Allowance for nutrition, supply of waste in system, perspiration, and urine	29 lbs.

(Signed)

"'GEORGE VARNELL,

"'Demonstrator of Anatomy.'"

Here we find the excretions to be 11 lbs. more than those of the French horse experimented upon by M. Boussingault; but then the solid food given to the English horse was 4 lbs. more, and the liquid upwards of 7 lbs. extra.

We may then, perhaps, assume, without fear of erring, that the excrements voided by horses in the course of 24 hours, weigh, at the least, 45 lbs.

Hence the gross quantity of dung produced by the 7,300,000 horses which traverse the London streets in the course of the twelvemonth will be 7,300,000 × 45, or 328,500,000 lbs., which is upwards of 146,651 tons. But these horses cannot be said to be at work above six hours each day; we must, therefore, divide the above quantity by four, and thus we find that there are 36,662 tons of horse-dung annually dropped in the streets of London.

I am informed, on good authority, that the evacuations of an ox, in 24 hours, will, on the average, exceed those of a horse in weight by about a fifteenth, while, if the ox be disturbed by being driven, the excretions will exceed the horse's by about a twelfth. As the oxen are not driven in the streets, or detained in the market for so long a period as horses are out at work, it may be fair to compute that their droppings are about the same, individually, as those of the horses.

Hence as there are 224,000 horned cattle yearly brought to London, we have 224,000 × 45 lbs. = 10,080,000 lbs., or 4500 tons, for the gross quantity of ordure dropped by this number of animals in the course of 24 hours, so that, dividing by 4, as before, we find that there are 1125 tons of ordure annually dropped by the "horned cattle" in the streets of London.

Concerning the sheep, I am told that it may be computed that the ordure of five sheep is about equal in weight to that of two oxen. As regards the other animals it may be said that their "droppings" are insignificant, the pigs and calves being very generally carted to and from the market, as, indeed, are some of the fatter and more valuable sheep and lambs. All these facts being taken into consideration, I am told by a regular frequenter of Smithfield market, that it will be best to calculate the droppings of each of the 1,617,300 sheep, calves, and pigs yearly coming to the metropolis at about one-fourth of those of the horned cattle; so that multiplying 1,617,300 by 10, instead of 45, we have 16,173,000 lbs., or 7220 tons, for the weight of ordure deposited by the entire number of sheep, calves, and pigs annually brought to the metropolis, and then dividing this by 4, as usual, we find that the droppings of the calves, sheep, and pigs in the streets of London amount to 1805 tons per annum.

Now putting together all the preceding items we obtain the following results:—

GROSS WEIGHT OF THE HORSE-DUNG AND CATTLE-DROPPINGS ANNUALLY DEPOSITED IN THE STREETS OF LONDON:—

	Tons.
Horse-dung	36,662
Droppings of horned cattle . . .	1,125
Droppings of sheep, calves, and pigs	1,805
	39,592

Hence we perceive that the gross weight of animal excretions dropped in the public thoroughfares of the metropolis is about 40,000 tons per annum, or, in round numbers, 770 tons every week-day—say 100 tons a day.

This, I am well aware, is a low estimate, but it appears to me that the facts will not warrant any other conclusion. And yet the Board of Health, who seem to delight in "large" estimates, represent the amount of animal manure deposited in the streets of London at no less than 200,000 tons per annum.

"Between the Quadrant in Regent-street and Oxford-street," says the first Report on the Supply of Water to the Metropolis, "a distance of a third of a mile, three loads on the average of dirt, almost all horse-dung, are removed daily. On an estimate made from the working of the street-sweeping machine, in one quarter of the City of London, which includes lines of considerable traffic, the quantity of dung dropped must be upwards of 60 tons, or about 20,000 tons per annum, and this, on a City district, which comprises about one-twentieth only of the covered area of the metropolis, though within that area there is the greatest proportionate amount of traffic. Though the data are extremely imperfect, it is considered that the horse-dung which falls in the streets of the whole metropolis *cannot be less than* 200,000 *tons a year.*"

Hence, although the data are imperfect, the Board of Health do not hesitate to conclude that

Original from HARVARD UNIVERSITY

the gross quantity of horse-dung dropped throughout every part of London—back streets and all—are equal to one-half of that let fall in the greatest London thoroughfares. According to this estimate, all and every of the 24,000 London horses must void, in the course of the six hours that they are at work in the streets, not less than 51 lbs. of excrement, which is at the rate of very nearly 2 cwt. in the course of the day, or voiding only 49 lbs. in the twenty-four hours, they must remain out altogether, and never return to the stable for rest!!!

Mr. Cochrane is far less hazardous than the Board of Health, and appears to me to arrive at his result in a more scientific and conclusive manner. He goes first to the Stamp Office to ascertain the number of horses in the metropolis, and then requests the professors of the Veterinary College to estimate the average quantity of excretions produced by a horse in the course of 24 hours. All this accords with the soundest principles of inquiry, and stands out in startling contrast with the unphilosophical plan pursued by the Board of Health, who obtain the result of the most crowded thoroughfare, and then halving this, frame an exaggerated estimate for the whole of the metropolis.

But Mr. Cochrane himself appears to me to exceed that just caution which is so necessary in all statistical calculations. Having ascertained that a horse voids 49 lbs. of dung in the course of 24 hours, he makes the whole of the 24,214 horses in the metropolis drop 30 lbs. daily in the streets, so that, according to his estimate, not only must every horse in London be out every day, but he must be at work in the public thoroughfares for very nearly 15 hours out of the 24!

The following is the estimate made by Mr. Cochrane:—

Daily weight of manure deposited in the streets by 24,214 horses × 30 lbs. = 726,420 lbs., or 324 tons, 5 cwt., 100 lbs.
Weekly weight, 2270 tons, 1 cwt., 28 lbs.
Annual weight, 118,043 tons, 5 cwt.
Tons or cart-loads deposited annually, valued at 6*s.* × 118,043 = 35,412*l.* 19*s.* 6*d.*

It has, then, been here shown that, assuming the number of horses worked daily in the streets of London to be 20,000, and each to be out six hours *per diem*, which, it appears to me, is all that can be fairly reckoned, the quantity of horse-dung dropped weekly is about 700 tons, so that, including the horses of the cavalry regiments in London, which of course are not comprised in the Stamp-Office returns, as well as the animals taken to Smithfield, we may, perhaps, assert that the annual ordure let fall in the London streets amounts, at the outside, to somewhere about 1000 tons weekly, or 52,000 tons per annum.

The next question becomes—what is done with this vast amount of filth?

The Board of Health is a much better guide upon this point than upon the matter of quantity: "Much of the horse-dung dropped in the London streets, under ordinary circumstances," we are told, "dries and is pulverized, and with the common soil is carried into houses as dust, and dirties clothes and furniture. The odour arising from the surface evaporation of the streets when they are wet is chiefly from horse-dung. Susceptible persons often feel this evaporation, after partial wetting, to be highly oppressive. The surface-water discharged into sewers from the streets and roofs of houses is found to contain as much filth as the soil-water from the house-drains."

Here, then, we perceive that the whole of the animal manure let fall in the streets is worse than wasted, and yet we are assured that it is an article, which, if properly collected, is of considerable value. "It is," says the Report of the National Philanthropic Association, "an article of Agricultural and Horticultural commerce which has ever maintained a high value with the farmers and market-gardeners, wherever conveniently obtainable. When these cattle-droppings can be collected *unmixed*, in dry weather, they bear an acknowledged value by the grazier and root-grower;—there being no other kind of manure which fertilizes the land so bounteously. Mr. Marnock, Curator of the Royal Botanical Society, has valued them at from 5*s.* to 10*s.* per load; according to the season of the year. The United Paving Board of St. Giles and St. George, since the introduction of the Street Orderly System into their parishes, has wisely had it collected in a state separate from all admixture, and sold it at highly remunerative prices, rendering it the means of considerably lessening the expense of cleansing the streets."

Now, assuming the value of the street-dropped manure to be 6*s.* per ton when collected free from dirt, we have the following statement as to the value of the horse and cattle-voidances let fall in the streets of London:—

52,000 tons of cattle-droppings,
at 6*s.* per ton £15,600 0 0

Mr. Cochrane, who considers the quantity of animal-droppings to be much greater, attaches of course a greater value to the aggregate quantity. His computation is as follows:—

118,043 tons of cattle-droppings,
at 6*s.* per ton £35,412 19 6

It seems to me that the calculations of the quantity of horse and cattle-dung in the streets, are based on such well-authenticated and scientific foundations, that their accuracy can hardly be disputed, unless it be that a higher average might fairly be shown.

Whatever estimate be adopted, the worth of street-dropped animal manure, if properly secured and made properly disposable, is great and indisputable; most assuredly between 10,000*l.* and 20,000*l.* in value.

Of Street "Mac" and other Mud.

First of that kind of mud known by the name of "mac."

The scavengers call mud all that is *swept* from the granite or wood pavements, in contradistinction

Original from HARVARD UNIVERSITY

to mac, which is both *scraped* and swept on the macadamized roads. The mud is usually carted apart from the mac, but some contractors cause their men to shovel every kind of dirt they meet with into the same cart.

The introduction of Mac Adam's system of road-making into the streets of London called into existence a new element in what is accounted street refuse. Until of late years little attention was paid to "Mac," for it was considered in no way distinct from other kinds of street-dirt, nor as being likely to possess properties which might adapt it for any other use than that of a component part of agricultural manure.

Mac is found principally on the roads from which it derives its name, and is, indeed, the grinding and pounding of the imbedded pieces of granite, which are the staple of those roads. It is, perhaps, the most adhesive street-dirt known, as respects the London specimen of it; for the exceeding traffic works and kneads it into a paste which it is difficult to remove from the texture of any garment splashed or soiled with it.

"Mac" is carted away by the scavengers in great quantities, being shovelled, in a state of more or less fluidity or solidity, according to the weather, from the road-side into their carts. Quantities are also swept with the rain into the drains of the streets, and not unfrequently quantities are found deposited in the sewers.

The following passage from "Sanatory Progress," a work before alluded to, cites the opinion of Lord Congleton as to the necessity of continually removing the mud from roads. I may add that Lord Congleton's work on road-making is of high authority, and has frequently been appealed to in parliamentary discussions, inquiries, and reports on the subject.

"The late Lord Congleton (Sir Henry Parnell) stated before a Committee of the House of Commons, in June, 1838, 'a road should be cleansed from time to time, so as *never* to have half an inch of mud upon it; and this is particularly necessary to be attended to where the materials are *weak;* for, if the surface be not kept clean, so as to admit of its becoming dry in the intervals between showers of rain, it will be rapidly worn away.' How truly," adds the Report, "is his Lordship's opinion verified every day on the macadamized roads in and around London! * * * * * * The horse-manure and other filth are there allowed to accumulate, and to be carried about by the horses and carriage-wheels; the road is formed into cavities and mud-hollows, which, being wetted by the rain and the constantly plying *watering-carts,* retain the same. Thus, not only are vast quantities of offensive mud formed, but puddles and *pools of water* also; which water, not being allowed to run off to the side gutter, by declivity, owing to the *mud embankments* which surround it, naturally *percolates through the surface of the road, dissolving and loosening the soft earthy matrix* by which the broken granite is surrounded and fixed."

The quantity of mac produced is the next consideration, and in endeavouring to ascertain this there are no specific data, though there are what, under other circumstances, might be called circumstantial or inferential evidence.

I have shown both the length of the streets and roads and the proportion which might be pronounced macadamized ways in the Metropolis Proper. But as in the macadamized proportion many thoroughfares cannot be strictly considered as yielding "mac," I will assume that the roads and streets producing this kind of dirt, more or less fully, are 1200 miles in length.

On the busier macadamized roads in the vicinity of what may be called the interior of London, it is common, I was told by experienced men, in average weather, to collect daily two cart-loads of what is called mac, from every mile of road. The mass of such road-produce, however, is mixed, though the "mac" unquestionably predominates. It was described to me as mac, general dirt, and droppings, more than the half being "mac." In wet weather there is at least twenty times more "mac" than dung scavenged; but in dry weather the dung and other street-refuse constitute, perhaps, somewhat less than three-fourths of each cart-load. The "mac" in dry weather is derived chiefly from the fluid from the watering carts mixing with the dust, and so forming a paste capable of being removed by the scraper of the scavenger.

It may be fair to assume that every mile of the roads in question, some of them being of considerable width, yields at least one cart-load of "mac," as a daily average, Sunday of course excepted. An intelligent man, who had the management of the mac and other street collections in a contractor's wharf, told me that in a load of mac carted from the road to any place of deposit, there was (I now use his own words) "a good deal of water; for there's great difference," he added, "in the *stiffness* of the mac on different roads, that seem very much the same to look at. But that don't signify a halfpenny-piece," he said, "for if the mac is wanted for any purpose, and let be for a little time, you see, sir, the water will dry up, and leave the proper stuff. I haven't any doubt whatever that two loads a mile are collected in the way you've been told, and that a load and a quarter of the two is 'mac,' though after the water is dried up out of it there mightn't be much more than a load. So if you want to calculate what the quantity of 'mac' is by itself, I think you had best say one load a mile."

But it is only in the more frequented approaches to the City or the West-end, such as the Knightsbridge-road, the New-road, the Old Kent-road, and thoroughfares of similar character as regards the extent of traffic, that two loads of refuse are daily collected. On the more distant roads, beyond the bounds traversed by the omnibuses for instance, or beyond the roads resorted to by the market gardeners on their way to the metropolitan "green" markets, the supply of street-refuse is hardly a quarter as great; one man thought it was a third, and another only a sixth of a load a day in quiet places.

Calculating then, in order to be within the mark,

Digitized by Google
Original from HARVARD UNIVERSITY

that the macadamized roads afford daily two loads of dirt per mile, and reckoning the great macadamized streets at 100 miles in length, we have the following results:—

QUANTITY OF STREET-REFUSE COLLECTED FROM THE MORE FREQUENTED MACADAMIZED THOROUGHFARES.

	Loads.
100 miles, 2 loads per day . . .	200
" Weekly amount . . .	1,200
" Yearly amount . . .	62,400

PROPORTION OF "MAC" IN THE ABOVE.

100 miles, 1 load per day	100
" Weekly	600
" Yearly	31,200

To this amount must be added the quantity supplied by the more distant and less frequented roads situate within the precincts of the Metropolis Proper. These I will estimate at one-eighth less than that of the roads of greater traffic. Some of the more quiet thoroughfares, I should add, are not scavenged more than once a week, and some less frequently; but on some there is considerable traffic.

QUANTITY OF STREET-REFUSE COLLECTED FROM THE LESS FREQUENTED MACADAMIZED THOROUGHFARES.

	Loads.
1100 miles, ¼ load per day . . .	275
" Weekly	1,650
" Yearly	85,800

The proportion of mac to the gross dirt collected is greater in the more distant roads than what I have already described, but to be safe I will adopt the same ratio.

PROPORTION OF "MAC."

	Loads.
1100 miles of road, ⅛ load per day .	137
" Weekly . . .	825
" Yearly . . .	42,900

YEARLY TOTAL OF THE GROSS QUANTITY OF STREET-REFUSE, WITH THE PROPORTIONATE QUANTITY OF "MAC" COLLECTED FROM THE MACADAMIZED THOROUGHFARES OF THE METROPOLIS.

	Street Refuse.	"Mac."
	Cart-loads.	Loads.
100 miles of macadamized roads	62,400	31,200
1100 miles ditto ditto	85,800	42,900
	148,200	74,100

Thus upwards of 74,000 cart-loads of "mac" are, at a low computation, annually scraped and swept from the metropolitan thoroughfares.

So far as to the *quantity* of "mac" collected, and now as to its *uses*.

"'Mac,' or *Macadam*," says one of Mr. Cochrane's Reports, "is a grand prize to the scavenging contractor, who finds ready vend and a high price for it among the builders and brick-makers. Those who *paid* for the road—and their surveyors, *possibly*—know nothing of its value, or of their own loss by its removal from the road; they consider it in the light of *dirt*—*offensive* dirt—and are glad to *pay* the scavenger for carrying it away! When the *broom* comes, the scavenger's men take care to go *deep* enough; and many of them are, moreover, instructed to keep the '*mac*' as free from admixture with foreign substances as possible; for, though cattle-dung be valuable enough in itself, the '*mac*' loses *its* value to the builder and brickmaker by being *mixed with it.* Indeed, both are valuable for their respective uses if kept separate, not otherwise."

On my first making inquiries as to the uses and value of "mac," I was frequently told that it was utterly valueless, and that great trouble and expense were incurred in merely getting rid of it. That this is the case with many contractors is, doubtlessly, the fact; for now, unless the "mac," or, rather, the general road-dirt, be ordered, or a market for it be assured, it must be got rid of without a remuneration. Even when the contractor can shoot the "mac" in his own yard, and keep it there for a customer, there is the cost of re-loading and re-carting; a cost which a customer requiring to use it at any distance may not choose to incur. Great quantities of "mac," therefore, are wasted; and more would be wasted, were there places to waste it in.

Let me, therefore, before speaking of the uses and sale of it, point out some of the reasons for this wasting of the "mac" with other street-dirt. In the first place, the weight of a cart-load of street-refuse of any kind is usually estimated at a ton; but I am assured that the weight of a cart-load of "stiff mac" is a ton and a quarter at the least; and this weight becomes so trying to a scavenger's horse, as the day's work advances, that the contractor, to spare the animal, is often glad to get rid of the "mac" in any manner and without any remuneration. Thousands of loads of "mac," or rather of mixed street-dirt, have for this, and other reasons, been thrown away; and no small quantity has been thrown down the gulley-holes, to find its way into that main metropolitan sewer, the Thames. Of this matter, however, I shall have to speak hereafter.

There is no doubt that it is common for contractors to represent the "mac" they collect as being utterly valueless, and indeed an incumbrance. The "mixed mac," as I have said, may be so. Some contractors urge, especially in their bargains with the parish board, that all kinds of street dirt are not only worthless, but expensive to be got rid of. Five or six years ago, this was urged very strenuously, for then there was what was accounted a combination among the contractors. The south-west district of St. Pancras, until within the last six years, *received* from the contractor for the public scavengery, 100*l.* for the year's aggregation of street and house dirt. Since then, however, they have had to pay him 500*l.* for removing it.

Notwithstanding the reluctance of some of the

Original from HARVARD UNIVERSITY

contractors to give information on this, or indeed any subject connected with their trade, I have ascertained from indubitable authority, that "mac" is disposed of in the following manner. Some, but this is mostly the mixed kind, is got rid of in *any* manner: it has even been diluted with water so as to be driven down the drains. Some is mixed with the general street ordure—about a quarter of "mac," I was told, to three-quarters of dung and street mud—and shipped off in barges as manure. Some is given to builders, when they require it for the foundations of any edifices that are "handy," or rather it is carted thither for a nominal price, such as a trifle as beer-money for the men. Some, however, is *sold* for the same purpose, the contractors alleging that the charge is merely for cartage. Some, again, is given away or sold (with the like allegation) for purposes of levelling, of filling up cavities, or repairing unevennesses in any ground where improvements are being carried on; and, finally, some is sold to masons, plasterers, and brickmakers, for the purposes of their trade.

Even for such purposes as "filling up," there must be in the "mixed mac" supplied, at least a considerable preponderance of the pure material, or there would not be, as I heard it expressed, a sufficient "setting" for what was required.

As a set-off to what is sold, however, I may here state that 30*s.* has been paid for the privilege of depositing a barge-load of mixed street dirt in Battersea-fields, merely to get rid of it.

The principal use of the unmixed "mac" is as a component part of the mortar, or lime, of the mason in the exterior, and of the plasterer in the interior, construction of buildings, and as an ingredient of the mill in brick-grounds.

The accounts I received of the properties of "mac" from the vendors of it, were very contradictory. One man, until lately connected with its sale, informed me that as far as his own experience extended, "mac" was most in demand among scamping builders, and slop brickmakers, who looked only to what was cheap. To a notorious "scamper," he one morning sent three cart-loads of "mac" at 1*s.* a load, all to be used in the erection of the skeleton of one not very large house; and he believed that when it was used instead of sand with lime, it was for inferior work only, and was mixed, either for masons' or plasterers' work, with bad, low-priced mortar. Another man, with equal knowledge of the trade, however, represented "mac" as a most valuable article for the builder's purposes, it was "so *binding*," and this he repeated emphatically. A working builder told me that "mac" was as good as the best sand; it made the mortar "hang," and without either that or sand, the lime would "brittle" away.

"Mac" may be said to be composed of pulverised granite and rain water. Granite is composed of quartz, felspar, and mica, each in granular crystals. Hence, alumina being clay, and silex a substance which has a strong tendency to enter into combination with the lime of the mortar, the pulverizing of granite tends to produce a substance which has necessarily great binding and indurating properties.

From this reduction of "mac" to its elements, it is manifest that it possesses qualities highly valuable in promoting the cohesive property of mortar, so that, were greater attention paid to its collection by the scavenger, there would, in all probability, be an improved demand for the article, for I find that it is already used in the prosecution of some of the best masons' work. On this head I can cite the authority of a gentleman, at once a scientific and practical architect, who said to me,—

"'Mac' is used by many respectable builders for making mortar. The objection to it is, that it usually contains much extraneous decaying matter."

Increased care in the collection of the material would, perhaps, remove this cause of complaint.

I heard of one West-end builder, employing many hands, however, who had totally or partially discontinued the use of "mac," as he had met with some which he considered showed itself *brittle* in the plastering of walls.

"Mac," is pounded, and sometimes sifted, when required for use, and is then mixed and "worked up" with the lime for mortar, in the same way as sand. By the brickmakers it is mixed with the clay, ground, and formed into bricks in a similar manner.

Of the proportion sold to builders, plasterers, and brickmakers, severally, I could learn no precise particulars. The general opinion appears to be, that "mac" is sold most to brickmakers, and that it would find even a greater sale with them, were not brick-fields becoming more and more remote. I moreover found it universally admitted, that "mac" was in less demand—some said by one-half—than it was five or six years back.

Such are the *uses* of "mac," and we now come to the question of its *value*.

The price of the purer "mac" seems, from the best information I can procure, to have varied considerably. It is now generally cheap. I did not hear any very sufficing reason advanced to account for the depreciation, but one of the contractors expressed an opinion that this was owing to the "disturbed" state of the trade. Since the passing of the Sanitary Bill, the contractors for the public scavengery have been prevented "shooting" any valueless street-dirt, or dirt "not worth carriage" in convenient waste-places, as they were once in the habit of doing. Their yards and wharfs are generally full, so that, to avoid committing a nuisance, the contractor will not unfrequently sell his "mac" at reduced rates, and be glad thus to get rid of it. To this cause especially Mr. —— attributed the deterioration in the price of "mac," but if he had convenience, he told me, and any change was made in the present arrangements, he would not scruple to store 1000 loads for the demands of next summer, as a speculation. I am of opinion, moreover, notwithstanding what seemed something very like unanimity of opinion on the part of the sellers of "mac," that what is given or thrown away is usually, if not always, *mixed* or inferior "mac," and that what is sold at the

lowest rate is only a degree or two better; unless, indeed, it be under the immediate pressure of some of the circumstances I have pointed out, as want of room, &c.

On inquiring the price of "mac," I believe the answer of a vendor will almost invariably be found to be "a shilling a load;" a little further inquiry, however, shows that an extra sum may have to be paid. A builder, who gave me the information, asked a parish contractor the price of "mac." The contractor at once offered to supply him with 500 loads at 1*s.* a load, if the "mac" were ordered beforehand, and could be shot at once; but it would be 6*d.* a mile extra if delivered a mile out of the mac-seller's parish circuit, or more than a mile from his yard; while, if extra care were to be taken in the collection of the "mac," it would be 2*d.*, 3*d.*, 4*d.*, or 6*d.* a load higher. This, it must be understood, was the price of "*wet* mac."

Good "*dry* mac," that is to say, "mac" ready for use, is sold to the builder or the brickmaker at from 2*s.* to 3*s.* the load; 2*s.* 6*d.*, or something very near it, being now about an average price. It is dried in the contractor's yard by being exposed to the sun, or it is sometimes protected from the weather by a shed, while being dried. More wet "mac" would be shot for the trade, and kept until dry, but for want of room in the contractors' yards and wharfs; for "mac" must give way to the more valuable dung, and the dust and ashes from the bins. The best "mac" is sometimes described as "country mac," that is to say, it is collected from those suburban roads where it is likely to be little mixed with dung, &c.

A contractor told me that during the last twelve months he had sold 300 loads of "mac;" he had no account of what he had given away, to be rid of it, or of what he had sold at nominal prices. Another contractor, I was told by his managing man, sold last year about 400 loads. But both these parties are "in a large way," and do not supply the data upon which to found a calculation as to an average yearly sale; for though in the metropolis there are, according to the list I have given in p. 167 of the present volume, 63 contracts, for cleansing the metropolis, without including the more remote suburbs, such as Greenwich, Lewisham, Tooting, Streatham, Ealing, Brentford, and others—still some of the districts contracted for yield no "mac" at all.

From what I consider good authority, I may venture upon the following moderate computation as to the quantity of "mac" sold last year.

Estimating the number of contracts for cleansing the more central parishes at 35, and adding 20 for all the outlying parishes of the metropolis—in some of which the supply of road "mac" is very fine, and by no means scarce—it may be accurate enough to state that, out of the 55 individual contracts, 300 loads of "mac" were sold by each in the course of last year. This gives 16,500 loads of "mac" disposed of per annum. It may, moreover, be a reasonable estimate to consider this "mac," wet and dry together, as fetching 1*s.* 6*d.* a load, so that we have for the sum realized the following result:—

16,500 loads of "mac," at 1*s.* 6*d.* per load £1237 10

It may probably be considered by the contractors that 1*s.* 6*d.* is too high an average of price per load: if the price be minimized the result will be—

16,500 loads of "mac," at 1*s.* per load £825

Then if we divide the first estimate among the 55 contractors, we find that they receive upwards of 22*l.* each; the second estimate gives nearly 15*l.* each.

I repeat, that in this inquiry I can but approximate. One gentleman told me he thought the quantity of "mac" thus sold in the year was twice 1600 loads; another asserted that it was not 1000. I am assured, however, that my calculation does not exceed the truth.

I have given the full quantity of "mac," as nearly, I believe, as it can be computed, to be yielded by the metropolitan thoroughfares; the surplusage, after deducting the 1600 loads sold, must be regarded as consisting of mixed, and therefore useless, "mac;" that is to say, "mac" rendered so *thin* by continuous wet weather, that it is little worth; "mac" wasted because it is not storeable in the contractor's yard;—and "mac" used as a component part of a barge-load of manure.

In the course of my inquiries I heard it very generally stated that until five or six years ago 2*s.* 6*d.* might be considered a regular price for a load of "mac," while 4*s.*, 5*s.*, or even 6*s.* have been paid to one contractor, according to his own account, for the better kind of this commodity.

Of the Mud of the Streets.

The dirt yielded by a macadamized road, no matter what the composition, is always termed by the scavengers "*mac;*" what is yielded by a granite-paved way is always "*mud.*" Mixed mud and "mac" are generally looked upon as useless.

I inquired of one man, connected with a contractor's wharf, if he could readily distinguish the difference between "mac" and other street or mixed dirts, and he told me that he could do so, more especially when the stuff was sufficiently dried or set, at a glance. "If mac was darker," he said, "it always looked brighter than other street-dirts, as if all the colour was not ground out of the stone." He pointed out the different kinds, and his definition seemed to me not a bad one, although it may require a practised eye to make the distinction readily.

Street-mud is only partially mud, for mud is earthy particles saturated with water, and in the composition of the scavenger's street-mud are dung, general refuse (such as straw and vegetable remains), and the many things which in poor neighbourhoods are still thrown upon the pavement.

In the busier thoroughfares of the metropolis—apart from the City, where there is no macadamization requiring notice—it is almost impossible to keep street "mac" and mud distinct, even if the scavengers cared more to do so than is the case at present; for a waggon, or any other vehicle, en-

tering a street paved with blocks of wrought granite from a macadamized road must convey "mac" amongst mud; both "mac" and mud, however, as I have stated, are the most valuable separately.

In a Report on the Supply of Water, Appendix No. III., Mr. Holland, Upper Stamford-street, Waterloo-road, is stated to have said, in reply to a question on the subject:—"Suppose the inhabitants of one parish are desirous of having their streets in good order and clean: unless the adjoining districts concur, a great and unjust expense is imposed upon the cleaner parish; because every vehicle which passes from a dirty on to a clean street carries dirt from the former to the latter, and renders cleanliness more difficult and expensive. The inhabitants of London have an interest in the condition of other streets besides those of their own parish. Besides the inhabitants of Regent-street, for instance, all the riders in the 5000 vehicles that daily pass through that great thoroughfare are affected by its condition; and the inhabitants of Regent-street, who have to bear the cost of keeping that street in good repair and well cleansed, *for others' benefit as well as for their own*, may fairly feel aggrieved if they do not experience the benefits of good and clean streets when they go into other districts."

In the admixture of street-dirt there is this material difference—the dung, which spoils good "mac," makes good mud more valuable.

After having treated so fully of the road-produce of "mac," there seems no necessity to say more about mud than to consider its quantity, its value, and its uses.

In the Haymarket, which is about an eighth of a mile in length, and 18 yards in width, a load and a half of street-mud is collected daily (Sundays excepted), take the year through. As a farmer or market-gardener will give 3*s.* a load for common street-mud, and cart it away at his own cost, we find that were all this mud sold separately, at the ordinary rate, the yearly receipt for one street alone would be 70*l.* 4*s.* This public way, however, furnishes no criterion of the general mud-produce of the metropolis. We must, therefore, adopt some other basis for a calculation; and I have mentioned the Haymarket merely to show the great extent of street-dirt accruing in a largely-frequented locality.

But to obtain other data is a matter of no small difficulty where returns are not published nor even kept. I have, however, been fortunate enough to obtain the assistance of gentlemen whose public employment has given them the best means of forming an accurate opinion.

The street mud from the Haymarket, it has been positively ascertained, is 1¼ load each wet day the year through. Fleet-street, Ludgate-hill, Cheapside, Newgate-street, the "off" parts of St. Paul's Church-yard, Cornhill, Leadenhall-street, Bishopsgate-street, the free bridges, with many other places where locomotion never ceases, are, in proportion to their width, as productive of street mud as the Haymarket.

Were the Haymarket a mile in length, it would supply, at its present rate of traffic, to the scavenger 6 loads of street mud daily, or 36 loads for the scavenger's working week. In this yield, however, I am assured by practical men, the Haymarket is six times in excess of the average streets; and when compared with even "great business" thoroughfares, of a narrow character, such as Watling-street, Bow-lane, Old-change, and other thoroughfares off Cheapside and Cornhill, the produce of the Haymarket is from 10 to 40 per cent. in excess.

I am assured, however, and especially by a gentleman who had looked closely into the matter—as he at one time had been engaged in preparing estimates for a projected company purposing to deal with street-manures—that the 50 miles of the City may be safely calculated as yielding daily 1½ load of street mud per mile. Narrow streets—Thames-street for instance, which is about three-quarters of a mile long—yield from 2½ to 3½ loads daily, according to the season; but a number of off-streets and open places, such as Long-alley, Alderman's-walk, America-square, Monument-yard, Bridgewater-square, Austin-friars, and the like, are either streets without horse-thoroughfares, or are seldom traversed by vehicles. If, then, we calculate that there are 100 miles of paved streets adjoining the City, and yielding the same quantity of street mud daily as the above estimate, and 200 more miles in the less central parts of the metropolis, yielding only half that quantity, we find the following daily sum during the wet season:—

	Loads.
150 miles of paved streets, yielding 1½ load of street mud per mile	225
200 miles of paved streets, yielding ¾ load of street mud per mile	150
	375
Weekly amount of street mud during the wet season	2,250
Total ditto for six months in the year	58,500
63,000 loads of street mud, at 3*s.* per load	£8775

The great sale for this mud, perhaps nineteen-twentieths, is from the barges. A barge of street-manure, about one-fourth (more or less) "mac," or rather "mac" mixed with its street proportion of dung, &c., and three-fourths mud, dung, &c., contains from 30 to 40 tons, or as many loads. These manure barges are often to be seen on the Thames, but nearly three-fourths of them are found on the canals, especially the Paddington, the Regent's, and the Surrey, these being the most immediately connected with the interior part of the metropolis. A barge-load of this manure is usually sold at from 5*l.* to 6*l.* Calculating its average weight at 35 tons, and its average sale at 5*l.* 10*s.*, the price is rather more than 3*s.* a load. "Common street mud," I have been informed on good authority, "fetches 3*s.* per load from the farmer, when he himself carts it away."

The price of the barge-load of manure is tolerably uniform, for the quality is generally the same.

Some of the best, because the cleanest, street mud —as it is mixed only with horse-dung—is obtained from the wood streets, but this mode of pavement is so circumscribed that the contractors pay no regard to its manure produce, as a general rule, and mix it carelessly with the rest. Such, at least, is the account they themselves give, and they generally represent that the street manure is, owing to the outlay for cartage and boatage, little remunerative to them at the prices they obtain; notwithstanding, they are paid to remove it from the streets. Indeed, I heard of one contractor who was said to be so dissatisfied with the demand for, and the prices fetched by, his street-manure, that he has rented a few acres not far from the Regent's Canal, to test the efficacy of street dirt as a fertilizer, and to ascertain if to cultivate might not be more profitable than to sell.

Of the Surface-Water of the Streets of London.

The consideration of what Professor Way has called the "street waters" of the metropolis, is one of as great moment as any of those I have previously treated in my details concerning street refuse, whether "mac," mud, or dung. Indeed, water enters largely into the composition of the two former substances, while even the street dung is greatly affected by the rain.

The *feeders* of the street, as regards the street surface-water, are principally the rains. I will first consider the amount of surface-water supplied by the rain descending upon the area of the metropolis: upon the roofs of the houses, and the pavement of the streets and roads.

The depth of rain falling in London in the different months, according to the observations and calculations of the most eminent meteorologists, is as follows:—

Months.	Depth of Rain in inches.			Quantity of rain falling in the different seasons.	Number of days on which rain falls.
	Royal Society, according to observation.	Howard, according to observation.	Daniell, according to calculation.		
January	1·56	1·907	1·463		14·4
February ..	1·45	1·643	0·746	Winter.	15·8
March	1·36	1·542	1·440	5·368	12·7
April	1·55	1·719	1·786		14·0
May	1·67	2·636	1·854	Spring.	15·8
June	1·98	1·964	1·330	4·813	11·8
July	2·44	2·592	2·516		16·1
August	2·37	2·134	1·453	Summer.	16·3
September .	2·97	1·644	2·193	6·682	12·3
October....	2·46	2·872	2·073		16·2
November .	2·58	2·637	2·400	Autumn.	15·0
December .	1·65	2·489	2·426	7·441	17·7
Totals	24·04	25·179	22·199	24·304	178·1

The rainfall in London, according to a ten years' average of the Royal Society's observations, amounts to 23 inches; in 1848 it was as high as 28 inches, and in 1847 as low as 15 inches. The depth of rain annually falling near London is stated by Mr. Luke Howard to be, on an average of 23 years (1797-1819), as much as 25·179 inches. Mr. Daniel says that the average annual fall is 23 1/10 inches. The mean of the observations made at Greenwich between the years 1838 and 1849 was 24·84 inches.

The following extract from an account of the "Soft Water Springs of the Surrey Sands," by the Hon. Wm. Napier, is interesting.

"The amount of rainfall," says the Author, "is taken from a register kept at the Royal Military College, Sandhurst, from the year 1818 to 1846.

"The average fall of the last 15 years, during which time the register appears to have been correctly kept, is 22·64 inches. I consider this to be a very low estimate, however, of the average rainfall over the whole district. The fall on the ranges of the Hindhead must considerably exceed this amount, for I find in White's 'Selborne,' a register for ten years at that place; the greatest fall being in 1782, 50·26 inches, the lowest, in 1788, 22·50 inches, and the average of all 37·58 inches. The elevation of the Hindhead is about 800 feet above mean tide.

"With reference to the measurement of rainfall, it is difficult indeed to obtain more than a very approximate idea for a given district of not very great extent; the method of measurement is so uncertain, as liable to be affected by currents of air and evaporation. It is well known that elevated regions attract by condensation more rain than low lands, and yet a rain-gauge placed on the ground will register a greater fall than one placed immediately, and even at a small height, above it.

"M. Arago has shown from 12 years' observations at Paris, that the average depth of rain on the terrace of the Observatory was 19·88 inches, while 30 yards lower it was 22·21 inches. Dr. Heberden has shown the rainfall on the top of Westminster Cathedral, during a certain period to be only 12·09 inches, and at a lower level on the top of a house in the neighbourhood to be 22·608 inches. This fact has been observed all over the world, and I can only account for it as arising partly from the greater amount of condensation the nearer the earth's surface, but probably also from currents of air depriving a rain-gauge at a high elevation of its fair share."

The results of the above observations, as to the yearly quantity of rain falling in the metropolis, may be summed up as follows:—

	Inches of Rain falling Annually.
Royal Society (average of 20 years)	24·04
Mr. Howard (average of 23 years) .	25·179
Professor Daniell	22·199
Dr. Heberden	22·608
Mean	23·506

The "mean mean," or average of all the averages here given is within a fraction the average of the Royal Society's Observations for 10 years, and this is the quantity that I shall

adopt in my calculations as to the gross volume of rain falling over the entire area of London.

I have shown, by a detail of the respective districts in the Registrar General's department, that the metropolis contains 74,070 statute acres. Every square inch of this extent, as garden, arable, or pasture ground, or as road or street, or waste place, or house, or inclosed yard or lawn, of course receives its modicum of rain. Each acre comprises 6,272,640 square inches, and we thus find the whole metropolitan area to contain a number of square inches, almost beyond the terms of popular arithmetic, and best expressible in figures.

Area of metropolis in square inches, 464,614,444,800. Now, multiplying these four hundred and sixty four thousand, six hundred and fourteen millions, four hundred and forty-four thousand, eight hundred square inches, by 23, the number of inches of rain falling every year in London, we have the following result:—

Total quantity of rain falling yearly in the metropolis, 10,686,132,230,400 cubic inches.

Then, as a fraction more than 277¼ cubic inches of water represent a weight of 10 lbs., and an admeasurement of a gallon, we have the following further results:—

	Weight in pounds and tons.	Admeasurement in gallons.
Yearly Rainfall in the Metropolis	385,399,721,220 lbs., or 172,053,447 tons.	38,539,972,122 gals.

The total quantity of water mechanically supplied every day to the metropolis is said to be in round numbers 55,000,000 gallons, the amount being made up in the following manner:—

DAILY MECHANICAL SUPPLY OF WATER TO METROPOLIS.

Sources of Supply.	Average No. of Gallons per day.	
New River . . .	14,149,315	
East London . .	8,829,462	
Chelsea . . .	3,940,730	
West Middlesex . .	3,334,054	
Grand Junction . .	3,532,013	
Lambeth . . .	3,077,260	
Southwark and Vauxhall	6,313,716	
Kent	1,079,311	
Hampstead . . .	427,468	
Total from Companies		44,383,329
Artesian Wells . .		8,000,000
Land Spring Pumps .		3,000,000
Total daily . .		55,383,329

YEARLY MECHANICAL SUPPLY OF WATER.

From Companies . .	16,200,000,000 gals.
„ Artesian Wells .	1,920,000,000 „
„ Land Spring Pumps.	1,095,000,000 „
Total yearly . .	19,215,000,000 „

Hence it would appear that the rain falling in London in the course of the year is *rather more than double that of the entire quantity of water annually supplied to the metropolis by mechanical means*, the rain-water being to the other as 2·005 to 1·000.

Now, in order to ascertain what proportion of the entire volume of rain comes under the denomination of street surface-water, we must first deduct from the gross quantity falling the amount said to be caught, and which, in contradistinction to that mechanically *supplied* to the houses of the metropolis is termed, "catch." This is estimated at 1,000,000 gallons per diem, or 365,000,000 gallons yearly.

But we must also subtract from the gross quantity of rain-water that which falls on the roofs as well as on the "back premises" and yards of houses, and is carried off directly to the drains without appearing in the streets. This must be a considerable proportion of the whole, since the streets themselves, allowing them to be ten yards wide on an average, would seem to occupy only about one-tenth part of the entire metropolitan area, so that the rain falling *directly* upon the public thoroughfares will be but a tithe of the aggregate quantity. But the surface-water of the streets is increased largely by tributary shoots from courts and drainless houses, and hence we may fairly assume the *natural* supply to be doubled by such means. At this rate the volume of rain-water annually poured into and upon the metropolitan thoroughfares by natural means, will be between five and six thousand millions of gallons, or one hundred times the quantity that is daily supplied to the houses of the metropolis by mechanical agency.

Still only a part of this quantity appears in the form of surface-water, for a considerable portion of it is absorbed by the ground on which it falls—especially in dry weather—serving either to "lay the dust," or to convert it into mud. Due regard, therefore, being had to all these considerations, we cannot, consistently with that caution which is necessary in all statistical inquiries, estimate the surface-water of the London streets at more than one thousand millions of gallons per annum, or twenty times the daily mechanical supply to the houses of the entire metropolis, and which it has been asserted is sufficient to exhaust a lake covering the area of St. James's-park, 30 inches in depth.

The quantity of water annually poured upon the streets in the process of what is termed "watering" amounts, according to the returns of the Board of Health, to 275,000,000 gallons per annum! But as this seldom or never assumes the form of street surface-water, it need form no part of the present estimate.

What proportion of the thousand million gallons of "slop dirt" produced annually in the London streets is carried off down the drains, and what proportion is ladled up by the scavengers, I have no means of ascertaining, but that vast quantities run away into the sewers and there form large deposits of mud, everything tends to prove.

Mr. Lovick, on being asked, "How many loads of deposit have been removed in any one week in the Surrey and Kent district? What is the total

Original from HARVARD UNIVERSITY

quantity of deposit removed in any one week in the whole of the metropolitan district?" replied:

"It is difficult, if not impossible, to ascertain correctly the quantity removed, owing to the variety of forms of sewers and the ever-varying forms assumed by the deposit from the action of varying volumes of water; but I have had observations made on the rate of accumulation, from which I have been enabled roughly to approximate it. In one week, in the Surrey and Kent district, about 1000 yards were removed. In one week, in the whole of the metropolitan districts, including the Surrey and Kent district, between 4000 and 5000 yards were removed; but in portions of the districts these operations were not in progress."

It is not here stated of what the deposit consisted, but there is no doubt that "mac" from the streets formed a great portion of it. Neither is it stated what period of time had sufficed for the accumulation; but it is evident enough that such deposits in the course of a year must be very great.

The street surface-water has been analyzed by Professor Way, and found to yield different constituents according to the different pavements from which it has been discharged. The results are as follows:—

"*Examination of Samples of Water from Street Drainage, taken from the Gullies in the Sewers during the rain of 6th May,* 1850.

"The waters were all more or less turbid, and some of them gave off very noxious odours, due principally to the escape of sulphuretted hydrogen gas.

"Some of them were alkaline to test-paper, but the majority were neutral.

"The following table exhibits the quantity of matter (both in solution and in solid state) contained in an imperial gallon of each specimen.

"STREET WATERS.

Number of Bottle.	Name of Street.	Quality of Paving.	Quality of Traffic.	Residue in an Imperial Gallon.		
				Soluble.	Insoluble.	Both.
				Grains.	Grains.	Grains.
1	Duke-street, Manchester-square .	Macadam	Middling	92·80	105·95	198·75
7	Foley-street (upper part) . .	"	Little	95·13	116·30	211·43
5	Gower-street	Granite	Middling	126·00	168·30	294·30
12	Norton-street	"	Little	123·87	3·00	126·87
3	Hampstead-road (above the canal)	Ballasted	Great	96·00	84·00	180·00
4	Ferdinand-street	"	Middling	44·00	48·30	92·30
2	Ferdinand-place	"	Little	50·80	34·30	85·10
10	Oxford-street	Granite	Great	276·23	537·10	813·33

"The influence of the quality of the paving on the composition of the drainage water," says Professor Way, "is well seen in the specimens Nos. 10, 6, and 11, all of them from Oxford-street, the traffic being described as 'Great.'

"The quantity of soluble salts is here found to be greatest from the granite matter from the macadamized road, and very inconsiderable from the wood pavement.

"The same relation between the granite and macadam pavement seems to hold good in the other instances; the granite for any quality of traffic affording more soluble salts to the water than the macadam.

"The ballasted pavement holds a position intermediate between the macadam and the wood, giving more soluble salts than the wood, but less than the macadam.

"The quantity of solid (insoluble) matter in the different samples of water, *which is a measure of the mechanical waste of the different kinds of pavement*, appears also to follow the same relation as that of the soluble salts; that is to say, granite greatest, next macadam, then ballasted, and, lastly, wood pavement, which affords a quantity of solid deposit almost too small to deserve notice.

"The influence of the quality of traffic on the composition of the different specimens of drainage is well marked in nearly all cases; the greatest amount of matter both insoluble and soluble being found in the water obtained from the streets of great traffic.

"The following table shows the composition of the soluble salts of four specimens, two of them being from the granite, and two from the macadam pavement.

"It appears from the table that the granite furnishes little or no magnesia to the water, whilst the quantity from the macadam is considerable.

"On the other hand, the quantity of potash is far greatest in the water derived from the granite.

"The traffic, as was before seen, has a very great influence on the quantity of the soluble salts. It seems also to influence their composition, for we find no carbonates either in the water from the granite, or that from the macadam, where

the traffic is little; whereas, when it is great, carbonates of lime and potash are found in the water in large quantity, a circumstance which is no doubt attributable to the action of decaying organic matter on the mineral substances of the pavement.

"The insoluble matter in the waters consists of the comminuted material of the road itself, with small fragments of straw and broken dung.

"The quantity of soluble salts (especially of salts of potash) in many of these samples of water is quite as great, and in some cases greater, than that found in the samples of sewer-water that have been examined; and it is open to question and further inquiry, whether the water obtained from the street-drainage of a crowded city might not often be of nearly equal value as liquid manure with the sewer-water with which it is at present allowed to mix."

With regard to the "ballasted pavement" mentioned by Professor Way, I may observe that it cannot be considered a *street*-pavement, unless exceptionally. It is formed principally of Thames ballast mixed with gravel, and is used in the construction of what are usually private or pleasure walks, such as the "gravel walks" in the inclosures of some of the parks, and upon Primrose-hill, &c.

Of the Master Scavengers in Former Times.

Degraded as the occupation of the scavenger may be in public estimation; though "I'd rather sweep the streets" may be a common remark expressive of the lowest deep of humiliation among those who never handled a besom in their lives; yet the very existence of a large body who are public cleansers betokens civilization. Their occupation, indeed, was defined, or rather was established or confirmed, in the early periods of our history, when municipal regulations were a sort of charter of civic protection, of civic liberties, and of general progress.

The noun *Scavenger* is said by lexicographers to be derived from the German *schaben*, to shave or scrape, "applied to those who scrape and clear away the filth from public streets or other places." The more direct derivation, however, is from the Danish verb *skaver*, the Saxon equivalent of which is *sceafan*, whence the English *shave*. Formerly the word was written *Scavager*, and meant simply one who was engaged in removing the *Scrapeage* or *Rakeage* (the working men, it will be seen, were termed also "rakers") from the surface of the streets. Hence it would appear that there is no authority for the verb to scavenge, which has lately come into use. The term from which the personal substantive is directly made, is *scavage*, a word formed from the verb in the same manner as *sewage* and *rubbage* (now fashionably corrupted into rubbish), and meaning the refuse which is or should be scraped away from the roads. The Latin equivalent from the Danish verb *skave*, is *scabere*.

I believe that the first mention of a scavenger in our earlier classical literature, is by Bishop Hall, one of the lights of the Reformation, in one of his "Satires."

> "To see the Pope's blacke knight, a cloaked frere,
> Sweating in the channel *like a scavengere*."

Many similar passages from the old poets and dramatists might be adduced, but I will content myself with one from the "Martial Maid" of Beaumont and Fletcher, as bearing immediately on the topic I have to discuss:—

> "Do I not know thee for the alguazier,
> Whose dunghil *all the parish scavengers*
> Could never rid."

Johnson defines a scavenger to be "a petty

Original from HARVARD UNIVERSITY

magistrate, whose province is to keep the streets clean;" and in the earlier times, certainly the scavenger was an officer to whom a certain authority was deputed, as to beadles and others.

One or two of these officials were appointed, according to the municipal or by-laws of the City of London, not to each parish, but to each ward. Of course, in the good old days, nothing could be done unless under "the sanction of an oath," and the scavengers were sworn accordingly on the Gospel, the following being the form as given in the black letter of the laws relating to the city in the time of Henry VIII.

"*The Oath of Scavagers, or Scavengers, of the Ward.*

"Ye shal swear, That ye shal wel and diligently oversee that the pavements in every Ward be wel and rightfully repaired, and not haunsed to the noyaunce of the neighbours; and that the Ways, Streets, and Lanes, be kept clean from Donge and other Filth, for the Honesty of the City. And that all the Chimneys, Redosses, and Furnaces, be made of Stone for Defence of Fire. And if ye know any such ye shall shew it to the Alderman, that he may make due Redress therefore. And this ye shall not lene. So help you God." *

To aid the scavengers in their execution of the duties of the office, the following among others were the injunctions of the civic law. They indicate the former state of the streets of London better than any description. A "Goung (or dung) fermour" appears to be a nightman, a dung-carrier or bearer, the servant of the master or ward scavenger.

"No Goungfermour shall spill any ordure in the Street, under pain of Thirteen Shillings and Four Pence.

"No Goungfermour shall carry any ordure till after nine of the clock in the Night, under pain of Thirteen Shillings and Four Pence. No man shall cast any urine boles, or ordure boles, into the Streets by Day or Night, *afore the Hour of nine in the Night.* And also he shall not cast it out, but bring it down and lay it in the Canel, under Pain of Three Shillings and Four Pence. And if he do so cast it upon any Person's Head, the Person to have a lawful Recompense, *if he have hurt thereby.*

"No man shall bury any Dung, or Goung, within the Liberties of this City, under Pain of Forty Shillings."

I will not dwell on the state of things which caused such enactments to be necessary, or on the barbarism of the law which ordered a lawful recompense to any person assailed in the manner intimated, only when he had "hurt thereby."

These laws were for the government of the city, where a body of scavengers was sometimes called a "street-ward." Until about the reign of Charles II., however, to legislate concerning such matters for the city was to legislate for the metropolis, as Southwark was then more or less under the city jurisdiction, and the houses of the nobility on the north bank of the Thames (the Strand), would hardly require the services of a public scavenger.

As new parishes or districts became populous, and established outside the city boundaries, the authorities seem to have regulated the public scavengery after the fashion of the city; but the whole, in every respect of cleanliness, propriety, regularity, or celerity, was most grievously defective.

Some time about the middle of the last century, the scavengers were considered and pronounced by the administrators or explainers of municipal law, to be "two officers chosen yearly in each parish in London and the suburbs, by the constables, churchwardens, and other inhabitants," and their business was declared to be, that they should "hire persons called 'rakers,' with carts to clean the streets, and carry away the dirt and filth thereof, under a penalty of 40*s*."

The scavengers thus appointed we should now term surveyors. There is little reason to doubt that in the old times the duly-appointed scavagers or scavengers, laboured in their vocation themselves, and employed such a number of additional hands as they accounted necessary; but how or when the master scavenger ceased to be a labourer, and how or when the office became merely nominal, I can find no information. So little attention appears to have been paid to this really important matter, that there are hardly any records concerning it. The law was satisfied to lay down provisions for street-cleansing, but to enforce these provisions was left to chance, or to some idle, corrupt, or inefficient officer or body.

Neither can I find any precise account of what was formerly done with the dirt swept and scraped from the streets, which seems always to have been left to the discretion of the scavenger to deal with as he pleased, and such is still the case in a great measure. Some of this dirt I find, however, promoted "the goodly nutriment of the land" about London, and some was "delivered in waste places apart from habitations." These waste places seem to have been the nuclei of the present dust-yards, and were sometimes "presented," that is, they were reported by a jury of nuisances (or under other titles), as "places of obscene resort," for lewd and disorderly persons, the lewd and disorderly persons consisting chiefly of the very poor, who came to search among the rubbish for anything that might be valuable or saleable; for there were frequent rumours of treasure or plate being temporarily hidden in such places by thieves. Some outcast wretches, moreover, slept within the shelter of these scavengers' places, and occasionally a vigilant officer—even down to our own times, or within these few years—apprehended such wretches, charged them with destitution, and had them punished accordingly. Much of the street refuse thus "delivered," especially the "dry rubbish," was thrown into the streets from

* "Haunsed" is explained by Strype to signify "made too high," and the "Redosses" to be "Reredoughs." A mason informed me that he believed these Redosses were what were known in some old country-houses as "Back-Flues," or flues connecting any fire-grate in the out-offices with the main chimney. The term "lene" is the Teutonic *Lehn*, and signifies "let, lease," or literally *loan*.

houses under repair, &c., (I now speak of the past century,) and no use seems to have been made of any part of it unless any one requiring a load or two of rubbish chose to cart it away.

I have given this sketch to show what master scavengers were in the olden times, and I now proceed to point out what is the present condition of the trade.

Of the Several Modes and Characteristics of Street-Cleansing.

We here come to the practical part of this complex subject. We have ascertained the length of the streets of London—we have estimated the amount of daily, weekly, and yearly traffic—calculated the quantity of mud, dung, "mac," dust, and surface-water formed and collected annually throughout the metropolis—we have endeavoured to arrive at some notion as to the injury done by all this vast amount of filth owing to what the Board of Health has termed "imperfect scavenging,"—and we now come to treat of the means by which the loads of street refuse—the loads of dust—loads of "mac" and mud, and the tons of dung, are severally and collectively removed throughout the year.

There are two distinct, and, in a measure, diametrically opposed, methods of street-cleansing at present in operation.

1. That which consists in cleaning the streets when dirtied.

2. That which consists in cleaning them and *keeping* them clean.

These modes of scavenging may not appear, to those who have paid but little attention to the matter, to be *very* widely different means of effecting the same object. The one, however, removes the refuse from the streets (sooner or later) *after it has been formed*, whereas the other removes it *as fast as it is formed*. By the latter method the streets are never allowed to get dirty—by the former they must be dirty before they are cleansed.

The plan of street-cleansing *before* dirtied, or the pre-scavenging system, is of recent introduction, being the mode adopted by the "street-orderlies;" that of cleansing after having dirtied, or the post-scavenging system, is (so far as the more *general* or common method is concerned) the same as that pursued two centuries ago. I shall speak of each of these modes in due course, beginning with that last mentioned.

By the ordinary method of scavenging, the dirt is still swept or scraped to one side of the public way, then shovelled into a cart and conveyed to the place of deposit. In wet weather the dirt swept or scraped to one side is so liquified that it is known as "slop," and is "lifted" into the cart in shovels hollowed like sugar-spoons. The only change of which I have heard in this mode of scavenging was in one of the tools. Until about nine years ago birch, or occasionally heather, brooms or besoms were used by the street-sweepers, but they soon became clogged in dirty weather, and then, as one working scavenger explained it to me, "they scattered and drove the dirt to the sides 'stead of making it go right a-head as you wants it." The material now used for the street-sweeper's broom is known as "bass," and consists of the stems or branches of a New Zealand plant, a substance which has considerable strength and elasticity of fibre, and both "sweeps" and "scrapes" in the process of scavenging. The broom itself, too, is differently constructed, having divisions between the several insertions of bass in the wooden block of the head, so that clogging is less frequent, and cleaning easier, whereas the birch broom consisted of a close mass of twigs, and thus scattered while it swept the dirt. There was, of course, some outcry on the part of the "established-order-of-things" gentry among scavengers, against the innovation, but it is now general. As all the scavengers, no matter how they vary in other respects, work with the brooms described, this one mention of the change will suffice. No doubt the cleansing of the streets is accomplished with greater efficiency and with greater celerity than it was, but the mere process of manual toil is little altered.

In a work like the present, however, we have more particularly to deal with the labourers engaged; and, viewing the subject in this light, we may arrange the several modes of street-cleansing into the four following divisions:—

1. By paid manual-labourers, or men employed by the contractors, and paid in the ordinary ways of wages.

2. By paid "Machine"-labourers, differing from the first only or mainly in the means by which they attain their end.

3. By pauper labourers, or men employed by the parishes in which they are set to work, and either paid in money or in food, or maintained in the workhouses.

4. By street-orderlies, or men employed by philanthropists—a body of workmen with particular regulations and more organized than other scavengers.

By one or other of these modes of scavengery all the public ways of the metropolis are cleansed; and the subject is most peculiar, as including within itself all the several varieties of labour, if we except that of women and children—viz., manual labour, mechanical labour, pauper labour, and philanthropic labour.

By these several varieties of labour the highways and by-ways of the entire metropolis are cleansed, with one exception—the Mews, concerning which a few words here may not be out of place. *All* these localities, whether they be what are styled Private or Gentlemen's Mews, or Public Mews, where stables, coach-houses, and dwelling-rooms above them, may be taken by any one (a good many of such places being, moreover, public or partial thoroughfares); or whether they be job-masters' or cab-proprietors' mews; are scavenged by the occupants, for the manure is valuable. The mews of London, indeed, constitute a world of their own. They are tenanted by one class—coachmen and grooms, with their wives and families—men who are devoted to one pursuit, the care of horses and carriages; who live and asso-

Original from HARVARD UNIVERSITY

ciate one among another; whose talk is of horses (with something about masters and mistresses) as if to ride or to drive were the great ends of human existence, and who thus live as much together as the Jews in their compulsory quarters in Rome. The mews are also the "chambers" of unemployed coachmen and grooms, and I am told that the very sicknesses known in such places have their own peculiarities. These, however, form matter for *future* inquiry.

Concerning the private scavenging of the metropolitan mews, the *Medical Times*, of July 26, 1851, contains a letter from Mr. C. Cochrane, in which that gentleman says:—

"It will be found, that in all the mews throughout the metropolis, the manure produced from each stable is packed up in a separate stack, until there is sufficient for a load for some market-gardener or farmer to remove. The groom or stable-man makes an arrangement, or agreement as it is called, with the market-gardener, to remove it at his convenience, and a gratuity of 1*s.* or 1*s.* 6*d.* per load is usually presented to the stable-man. In some places there are dung-pits containing the collectings of a fortnight's dung, which, when disturbed for removal, casts out an offensive effluvium, as sickening as it is disgusting to the whole neighbourhood. In consequence of the arrangement in question, if a third party wished to buy some of this manure, he could not get it; and if he wished to get rid of any by giving it away, the stableman would not receive it, as it would not be removed sufficiently quick by the farmer. The result is, that whilst the air is rendered offensive and insalubrious, manure becomes difficult to be removed or disposed of, and frequently is washed away into the sewer.

"Of this manure there are always (at a moderate computation) remaining daily, in the mews and stable-yards of the metropolis, at least 2000 cart-loads.

"To remedy these evils, I would suggest that a brief Act of Parliament should be passed, giving municipal and parochial authorities the same complete control over the manure as they have over the 'ashes,' with the provision, that owners should have the right of removing it themselves for their own use; but if they did not do so daily, then the control to return to the above authorities, who should have the right of selling it, and placing the proceeds in the parish funds. By this simple means immense quantities of valuable manure would be saved for the purposes of agriculture—food would be rendered cheaper and more abundant—more people would be employed—whilst the metropolis would be rendered clean, sweet, and healthy."

I may dismiss this part of the subject with the remark, that I was informed that the mews' manure was in regular demand and of ready sale, being removed by the market-gardeners with greater facility than can street-dirt, which the contractors with the parishes prefer to vend by the barge-load.

Having enumerated the four several modes of street-cleansing, I will now proceed to point out briefly the characteristics of each class of cleansing. This will also denote the quality of the employers and the nature of the employment.

1. *The Paid Manual Labourers* constitute the bulk of those engaged in scavenging, and the chief pay-masters are the contractors. Many of these labourers consider themselves the only "regular hands," having been "brought up to the business;" but unemployed or destitute labourers or mechanics, or reduced tradesmen, will often endeavour to obtain employment in street-sweeping; this is the necessary evil of all *unskilled* labour, for since every one can do it (without previous apprenticeship), it follows that the beaten-out artisans or discarded trade assistants, beggared tradesmen, or reduced gentlemen, must necessarily resort to it as their only means of independent support; and hence the reason why dock labour and street labour, and indeed all the several forms of unskilled work, have a tendency to be overstocked with hands—the *unskilled* occupations being, as it were, the sink for all the refuse *skilled* labour and beggared industry of the country.

The "contractors," like other employers, are separated by their men into two classes—such as, in more refined callings, are often designated the "honourable" and "dishonourable" traders—according as they pay or do not pay what is reputed "fair wages."

I cannot say that I heard any especial appellation given by the working scavengers to the better-paying class of employers, unless it were the expressive style of "good-'uns." The inferior paying class, however, are very generally known among their work-people as "scurfs."

2. *The Street-sweeping Machine Labourers.*—Of the men employed as "attendant" scavengers, for so they may be termed, in connection with these mechanical and vehicular street-sweepers, little need here be said, for they are generally of the class of ordinary scavengers. It may, however, be necessary to explain that each of those machines must have the street refuse, for the "lick-in" of the machine, swept into a straight line wherever there is the slightest slope at the sides of a street towards the foot-path; the same, too, must sometimes be done, if the pavement be at all broken, even when the progress of the machine is, what I heard, not very appropriately, termed "plain sailing." Sometimes, also, men follow the course of the street-sweeping machine, to "sweep up" any dirt missed or scattered, as the vehicle proceeds on a straightforward course, for at all to diverge would be to make the labour, where the machine alone is used, almost double.

3. *The Pauper, or Parish-employed Scavengers* present characteristics peculiarly their own, as regards open-air labour in London. They are employed less to cleanse the streets, than to prevent their being chargeable to the poor's rate as out-door recipients, or as inmates of the workhouses. When paid, they receive a lower amount of wages than any other scavengers, and they are sometimes paid in food as well as in money, while a difference may be made between the wages of the

HARVARD UNIVERSITY

married and of the unmarried men, and even between the married men who have and have not children; some, again, are employed in scavenging without any money receipt, their maintenance in the workhouse being considered a sufficient return for the fruits of their toil.

Some of these men are feeble, some are unskilful (even in tasks in which skill is but little of an element), and most of them are dissatisfied workmen. Their ranks comprise, or may comprise, men who have filled very different situations in life. It is mentioned in the second edition of one of the publications of the National Philanthropic Association, "Sanatory Progress" (1850), "that the once high-salaried cashier of a West-end bank died lately in St. Pancras-workhouse;—that the architect of several of the most fashionable West-end club-houses is now an inmate of St. James's-workhouse;—and that the architect of St. Pancras' New Church lately died in a back garret in Somers-town. "These recent instances (a few out of many)" says the writer, "prove that 'wealth has wings,' and that Genius and Industry have but leaden feet, when overtaken by Adversity. A late number of the *Globe* newspaper states that, 'among the police constables on the Great Western Railway, there are at present eight members of the Royal College of Surgeons, and three solicitors;'—and the *Limerick Examiner*, a few weeks ago, announced the fact, that 'a gentlewoman is now an inmate of the workhouse of that city, whose husband, a few years ago, filled the office of High Sheriff of the county.'"

I do not know that either the cashier or the architect in the two workhouses in question was employed as a street-sweeper.

This second class, then, are situated differently to the paid street-sweepers (or No. 1 of the present division), who may be considered, more or less, independent or self-supporting labourers, while the paupers are, of course, dependent.

4. *The "Street Orderlies."*—These men present another distinct body. They are not merely in the employment, but many of them are under the care, of the National Philanthropic Association, which was founded by, and is now under the presidency of, Mr. Cochrane. The objects of this society, as far as regards the street orderlies' existence as a class of scavengers, are sufficiently indicated in its title, which declares it to be "For the Promotion of Street Cleanliness and the Employment of the Poor; so that able-bodied men may be prevented from burthening the parish rates, and preserved independent of workhouse alms and degradation. Supported by the contributions of the benevolent."

The street orderlies, men and boys, are paid a fixed weekly wage, a certain sum being stopped from those single men who reside in houses rented for them by the association, where their meals, washing, &c., are provided. Among them are men of many callings, and some educated and accomplished persons.

The system of street orderlyism is, moreover, distinguished by one attribute unknown to any other mode; it is an effort, persevered in, despite of many hindrances and difficulties, to amend our street scavengery, indeed to reform it altogether; so that dust and dirt may be checked in their very origination.

The corporation, if I may so describe it, of the street orderlies, presents characteristics, again, varying from the other orders of what can only be looked upon either as the self-supporting or pauper workers.

These, then, are the several modes or methods of street-scavengery, and they show the following:—

CLASSES OF STREET-SWEEPING EMPLOYERS.

(1.) *Traders*, who undertake contracts for scavengery as a speculation. Under this denomination may be classed the contractors with parishes, districts, boards, liberties, divisions and subdivisions of parishes, markets, &c.

(2.) *Parishes*, who employ the men as a matter of parochial policy, with a view to the reduction of the rates, and with little regard to the men.

(3.) *Philanthropists*, who seek, more particularly, to benefit the men whom they employ, while they strive to promote the public good by increasing public cleanliness and order.

Under the head of "Traders" are the contractors with the parishes, &c., and the proprietors of the sweeping-machines, who are in the same capacity as the "regular contractors" respecting their dealings with labourers, but who substitute mechanical for manual operations.

Of these several classes of masters engaged in the scavengery of the metropolis I have much to say, and, for the clearer saying of it, I shall treat each of the several varieties of labour separately.

OF THE CONTRACTORS FOR SCAVENGERY.

THE scavenging of the streets of the metropolis is performed *directly* or *indirectly* by the authorities of the several parishes "without the City," who have the power to levy rates for the cleansing of the various districts; within the City, however, the office is executed under the direction of the Court of Sewers.

When the cleansing of the streets is performed indirectly by either the parochial or civic authorities, it is effected by contractors, that is to say, by traders who undertake for a certain sum to remove the street-refuse at stated intervals and under express conditions, and who employ paid servants to execute the work for them. When it is performed *directly*, the authorities employ labourers, generally from the workhouse, and usually enter into an agreement with some contractor for the use of his carts and appliances, together with the right to deposit in his wharf or yard the refuse removed from the streets.

I shall treat first of the *indirect* mode of scavenging—that is to say, of cleansing the streets by contract—beginning with the contractors, setting forth, as near as possible, the receipts and expenditure in connection with the trade, and then proceeding in due order to treat of the labourers employed by them in the performance of the task.

Some of the contractors agree with the parochial

Original from HARVARD UNIVERSITY

or district authorities to remove the dust from the house-bins as well as the dirt from the streets under one and the same contract; some undertake to execute these two offices under separate contracts; and some to perform only one of them. It is most customary, however, for the same contractor to serve the parish, especially the larger parishes, in both capacities.

There is no established or legally required *form* of agreement between a contractor and his principals; it is a bargain in which each side strives to get the best of it, but in which the parish representatives have often to contend against something looking like a monopoly; a very common occurrence in our day when capitalists choose to combine, which *is* legal, or unnoticed, but very heinous on the part of the working men, whose capital is only in their strength or skill. One contractor, on being questioned by a gentleman officially connected with a large district, as to the existence of combination, laughed at such a notion, but said there might be "a sort of understanding one among another," as among people who "must look to their own interests, and see which way the cat jumped;" concluding with the undeniable assertion that "no man ought reasonably to be expected to ruin himself for a parish."

There does not appear, however, to have been any countervailing qualities on the part of the parishes to this understanding among the contractors; for some of the authorities have found themselves, when a new or a renewed contract was in question, suddenly "on the other side of the hedge." Thus, in the south-west district of St. Pancras, the contractor, five or six years ago, paid 100*l.* per annum for the removal and possession of the street-dirt, &c.; but the following year the district authorities had to pay him 500*l.* for the same labour and with the same privileges! Other changes took place, and in 1848-9 a contractor again paid the district 95*l.* I have shown, too, that in Shadwell the dust-contractor now *receives* 450*l.* per annum, whereas he formerly *paid* 240*l.* To prove, however, that a spirit of combination does *occasionally* exist among these contractors, I may cite the following minute from one of the parish books.

Extract from Minute-book, Nov. 7, 1839. Letter C, Folio 437.

"Commissioner's Office,
"30, Howland-street,
"Nov. 7, 1839.

"Report of the Paving Committee to the General Board, relating to the watering the district for the past year.

"Your Committee beg leave to report that for the past three years the sums paid by contract for watering were respectively:—

"For 1836	£230
" 1837	220
" 1838	200

"That in the month of February in the present year the Board advertised in the usual manner for tenders to water the district, when the following were received, viz.:—

"Mr. Darke	£315
" Gore	318
" Nicholls	312
" Starkey	285

which was the lowest.

"Your Committee, anxious to prevent any increase in the watering-rate from being levied, and considering the amount required by the contractors for this service as excessive and exorbitant, and even evincing a spirit of combination, resolved to make an inroad upon this system, and after much trouble and attention adopted other measures for watering the district, the results of which they have great pleasure in presenting to the Board, by which it will be seen that a saving over the very lowest of the above tenders of 102*l.* 3*s.* has been effected; the sum of 18*l.* 18*s.* has been paid for pauper labour at the same time. Your Committee regret that, notwithstanding the efforts of themselves and their officers, the state of insubordination and insult of most of the paupers (in spite of all encouragement to industry) was such, that the Committee, on the 12th of July last, were reluctantly compelled to discontinue their services. The Committee cannot but congratulate the Board upon the result of their experiment, which will have the effect of breaking up a spirit of combination highly dangerous to the community at large, at the same time that their labours have caused a very considerable saving to the ratepayers; and they trust the work, considering all the numerous disadvantages under which they have laboured, has been performed in a satisfactory manner.

"P. Cunningham,
"Surveyor,
"30, Howland-street, Fitzroy-square."

The following regulations sufficiently show the nature of the agreements made between the contractors and the authorities as to the cleansing of the more important thoroughfares especially. It will be seen that in the regulations I quote every street, court, or alley, must now be swept *daily*, a practice which has only been adopted within these few years in the City.

"Sewers' Office, Guildhall, London, Rakers' Duties,* Midsummer, 1851, to Midsummer, 1852.

"*Cleansing.*

"*The whole surface* of every Carriage-way, Court, and Alley shall be swept *every day* (Sundays excepted), and all mud, dust, filth, and rubbish, all frozen or partially frozen matter, and snow, animal and vegetable matter, and everything offensive or injurious, shall be properly pecked, scraped, swept up, and carted away therefrom; and the iron gutters laid across or along the footways, the air-grates over the sewers, the gulley-

* The reader will remember that in the historical sketch given of the progress of public scavengery, the word "Rakers" occurred in connection with the sworn master scavengers, &c., &c.; the word is now unknown to the trade, except that it appears on city documents.

grates in the carriage-way of the streets respectively; and all public urinals are to be daily raked out, swept, and made clean and clear from all obstructions; and the Contractor or Contractors shall, in time of frost, continually keep the channels in the Streets and Places clear for water to run off: and cleanse and cart away refuse hogan or gravel (when called upon by the Inspector to do so) from all streets newly paved.

"The Mud and Dirt, &c., is to be carted away immediately that it is swept up.

"N.B. The Inspector of the District may, at any time he may think it necessary, order any Street or Place to be cleansed and swept a second time in any one day, and the Contractor or Contractors are thereupon bound to do the same.

"The Markets and their approaches are also to be thus cleansed DAILY, and the approaches thereto respectively are also to be thus cleansed at such an hour in the night of Saturday in each week as the Inspector of the District may direct.

"Every Street, Lane, Square, Yard, Court, Alley, Passage, and Place (except certain main Streets hereinafter enumerated), are to be thus cleansed within the following hours Daily: namely—

"In the months of April, May, June, July, August, and September. To be begun not earlier than 4 o'Clock in the morning, and finished not later than 1 o'Clock in the afternoon.

"In the months of October, November, December, January, February, and March. To be begun not earlier than 5 o'Clock in the morning, and finished not later than 2 o'Clock in the afternoon.

"The following main Streets are to be cleansed DAILY throughout the year (except Sundays), to be begun not earlier than 4 o'Clock in the morning, and finished not later than 9 o'Clock in the morning.

Fleet Street	Old Bailey
Ludgate Hill and Street	Lombard Street
St. Paul's Church Yard	New Bridge Street
Cheapside	Farringdon Street
Newgate Street	Aldersgate Street
Poultry	St. Martin-le-grand
Watling Street, Budge Row, and Cannon St.	Prince's Street
	Moorgate Street
Mansion House Street	The Street called 'The Pavement'
Cornhill	
Leadenhall Street	Finsbury Place, South
Aldgate Street and Aldgate	Gracechurch Street
	Bishopsgate St., within and without
King William Street and London Bridge	
	The Minories
Fenchurch Street	Wood Street
Holborn	Gresham Street
Holborn Bridge	Coleman Street.
Skinner Street	

"N.B. In times of frost and snow these hours of executing the work may be extended at the discretion of the Local Commissioners."

The other conditions relate to the removal of the dust from the houses (a subject I have already treated), and specify the fines, varying from 1*l.* to 5*l.*, to be paid by the contractors, for the violation or neglect of any of the provisions of the contract. It is further required that "Each Foreman, Sweeper, and Dustman, in the employ of either of the Contractors," (of whom there are four, Messrs. Sinnott, Rooke, Reddin, and Gould), "will be required to wear a Badge on the arm with these words thereon,—

"'London Sewers,
N°. —
Guildhall,'

by which means any one having cause of complaint against any of the men in the performance of their several duties, may, by taking down the number of the man and applying at the Sewers' Office, Guildhall, have reference to his name and employer.

"Any man working without his Badge, for each day he offends, the Contractor is liable to the penalty of Five Shillings.

"All the sweepings of the Streets, and all the dust and ashes from the Houses, are to be entirely carted away from the City of London, on a Penalty of *Ten Pounds* for each cart-load."

These terms sufficiently show the general nature of the contracts in question; the principal difference being that in some parts, the contractor is not required to sweep the streets more than once, twice, or thrice a week in ordinary weather.

The number of individuals in London styling themselves Master Scavengers is 34. Of these, 10 are at present without a contract either for dust or scavenging, and 5 have a contract for removing the dust only; so that, deducting these two numbers, the gross number 34 is reduced to 19 scavenging contractors. Of the latter number 16 are in a large way of business, having large yards, possessing several carts and some waggons, and employing a vast number of men daily in sweeping the streets, carting rubbish, &c. The other 3 masters, however, are only in a small way of business, being persons of more limited means. A *large* master scavenger employs from 3 to 18 carts, and from 18 to upwards of 40 men at scavengery alone, while a small master employs only from 1 to 3 carts and from 3 to 6 men. By the table I have given, p. 186, vol. ii., it is shown that there are 52 *contracts* between the several district authorities and master scavengers, and nineteen *contractors*, without counting members of the same family, as distinct individuals; this gives an average of nearly three distinct contracts per individual. The contracts are usually for a twelvemonth.

Although the table above referred to shows but 19 contractors for public scavenging, there are, as I have said, more, or about 24, in London, most of them in a "large way," and next year some of those who have no contracts at present may enter into agreements with the parishes. The smallness of this number, when we consider the vast extent of the metropolis, confirms the notion of the sort of monopoly and combination to which I have alluded. In the Post-Office Directory for 1851 there are no names under the heads of

Scavengers or Dustmen, but under the head of "Rubbish Carters," 28 are given, 9 names being marked as "Dust Contractors" and 10 as "Nightmen."

Of large contractors, however, there are, as I have said, about 24, but they may not all obtain contracts every year, and in this number are included different members of the same family or firm, who may undertake specific contracts, although in the trade it is looked upon as "one concern." The smaller contractors were represented to me as rather more numerous than the others, and perhaps numbered 40, but it is not easy to define what is to be accounted a contractor. In the table given in pp. 213, 214, I cite only 7 as being the better known. The others may be considered as small rubbish-carters and flying-dustmen.

There are yet other transactions in which the contractors are engaged with the parishes, independently of their undertaking the whole labour of street and house cleansing. In the parishes where pauper, or "poor" labour is resorted to—for it is not always that the men employed by the parishes are positive "paupers," but rather the unemployed poor of the parish—in such parishes, I say, an agreement is entered into with a contractor for the deposit of the collected street dirt at his yard or wharf. For such deposit the contractor must of course be paid, as it is really an occupation and renting of a portion of his premises for a specific purpose. The street dirt, however, is usually left to the disposal of the contractor, for his own profit, and where he once paid 50*l.* for the possession of the street-collected dirt of a parish, collected by labour which was no cost to him, he may now *receive* half of such 50*l.*, or whatever the terms of the agreement may be. I heard of one contractor who lately received 25*l.* where he once paid 50*l.*

In another way, too, contractors are employed by parishes. Where pauper or poor labour in street cleansing is the practice, a contractor's horses, carts, and cart-drivers are hired for the conveyance of the dirt from the streets. This of course is for a specific payment, and is in reality the work of the tradesmen who in the Post Office Directory are described as "Rubbish Carters," and of whom I shall have to speak afterwards. Some parishes or paving boards have, however, their own horses and vehicles, but in the other respects they have dealings with the contractors.

To come to as correct a conclusion as possible in this complicated and involved matter, I have obtained the aid of some gentlemen long familiar with such procedures. One of them said that to procure the accounts of such transactions for a series of years, with all their chops and changes, or to obtain a perfectly precise return, for any three years, affecting the whole metropolis, would be the work of a parliamentary commission with full powers "to send for papers," &c., &c., and that even *then* the result might not be satisfactory as a clear exposition. However, with the aid of the gentlemen alluded to, I venture upon the following approximation.

As my present inquiry relates only to the Scavenging Contractors in the metropolis, I will take the number of districts, markets, &c., which are specified in the table, p. 186, vol. ii. These are 83 in number, of which 29 are shown to be scavenged by the "parish." I will not involve in this computation any of the more rural places which may happen to be in the outskirts of the metropolitan area, but I will take the contracts as 54, where the contractors do the entire work, and as 29 where they are but the rubbish-carters and dirt receivers of the parishes.

I am assured that it is a fair calculation that the scavengery of the streets, apart from the removal of the dust from the houses, costs in payments to the contractors, 150*l.* as an average, to each of the several 54 districts; and that in the 29 localities in which the streets are cleansed by parish labour, the sum paid is at the rate of 50*l.* per locality, some of them, as the five districts of Marylebone for instance, being very large. This is calculated regardless of the cases where parishes may have their own horses and vehicles, for the cost to the rate-payers may not be very materially different, between paying for the hire of carts and horses, and investing capital in their purchase and incurring the expense of wear and tear. The account then stands thus:—

Parish payment on 54 contracts, 150*l.* each	£8100
Parish payment on 29 contracts, 50*l.* each	1450
Yearly total sum paid for Scavenging of the Metropolis	£9550

or, apportioned among 19 *contractors*, upwards of 500*l.* each; and among 83 *contracts*, about 115*l.* per *contract*. Even if other contractors are employed where parish labour is pursued, the cost to the rate-payers is the same. This calculation is made, as far as possible, as regards scavengery alone; and is independent of the value of the refuse collected. It is about the scavengery that the grand fight takes place between the parishes and contractors; the house dust, being uninjured by rain or street surface-water, is more available for trade purposes.

From this it would appear that the cost of cleansing the streets of London may be estimated in round numbers at 10,000*l.* per annum.

The next point in the inquiry is, What is the value of the street dirt annually collected?

The price I have adduced for the dirt gained from the streets is 3*s.* per load, which is a very reasonable average. If the load be dung, or even chiefly dung, it is worth 5*s.* or 6*s.* With the proportion of dung and street refuse to be found in such a thoroughfare as the Haymarket, in dry, or comparatively dry weather, a load, weighing about a ton, is worth about 3*s.* in the purchaser's own cart. On the other hand, as I have shown that quantities of mixed or slop "mac" have to be wasted, that some is sold at a nominal price, and a good deal at 1*s.* the load, 3*s.* is certainly a fair average.

Thus the annual sum of the street-dirt, as re-

Original from HARVARD UNIVERSITY

gards the quantity collected by the contracting scavengers (as shown in the table given at page 186), is, in round numbers, 89,000 cart-loads; that collected by parish labour, with or without the aid of the street-sweeping machines, at 52,000 cart-loads, or a total (I do not include what is collected by the orderlies) of 141,000 loads.

This result shows, then, that the contractors yearly collect by scavenging the streets with their own paid labourers, and receive as the produce of pauper labour, as follows:—

	Loads of Street Dirt.	Per Load.	Total.
By Contractors .	89,000	3*s.*	£13,350
By Parishes . .	52,000	3*s.*	7,800
Total . .	141,000		£21,150

or a value of rather more than 1113*l.* as the return to each individual contractor in the table, or about 255*l.* as the average on each contract. As, however, the whole of the parish-collected manure does not come into the hands of the contractors, it will be fair, I am assured, to compute the total at 19,000*l.*, a sum of 1000*l.* to each contractor, or nearly 229*l.* on each contract.

It would appear, then, that the total receipts of the contractors for the scavenging of London amount to very nearly 30,000*l.*; that is to say, 10,000*l.* as remuneration for the office, and 20,000*l.* as the value of the dirt collected. But against this sum as received, we have to set the gross expense of wages paid to men, wear and tear of carts and appliances, rent of wharfs, interest for money, &c.

Concerning the amount paid in wages, it appears by the table at pp. 186, 187, that the men employed by the scavenging contractors in wet weather, are 260 daily (being nearly half of the whole force of 531 men, the orderlies excepted). In dry weather, however, there are only 194 men employed. I will therefore calculate upon 194 men employed daily, and 66 employed half the year, making the total of 260. By the table here given, it will be seen that the total number of scavengers employed by the large and small contractors, is 275.

Number of Men.	Weekly Wage.	Yearly.
194 (for 12 months)	16*s.* *	£8070 8*s.*
66 (for 6 months)	16*s.*	1372 16*s.*
Total . .		£9443 4*s.*

There remains now to show the amount of capital which a large contractor must embark in his business: I include the amount of rent, and the expenditure on what must be provided for business purposes, and which is subject to wear and tear, to decay, and loss.

* I have computed all the weekly wages at 16*s.*, though some of the men are paid only 14*s.* My object in this is to give the contractors the benefit of the difference.

There are not now, I am told, more than twelve scavengers' wharfs and 20 yards (the wharf being also a yard) in the possession of the contractors in regular work. These are the larger contractors, and their capital, I am assured, may be thus estimated:—

CAPITAL OF THE MASTER SCAVENGERS.

	£	*s.*	*d.*
179 Carts, 21*l.* each . . .	3,759	0	0
3 Waggons, 32*l.* each . .	96	0	0
230 Horses, 25*l.* each . .	5,750	0	0
230 Sets of harness, 2*l.* each .	460	0	0
600 Brooms, 9*d.* each . .	22	10	0
300 Shovels, 1*s.* each . .	15	0	0
100 Barges, 50*l.* each . . .	5,000	0	0
Total . .	15,102	10	0

I have estimated according to what may be the *present* value, not the original cost, of the implements, vehicles, &c. A broom, when new, costs 1*s.* 2*d.*, and is worn out in two or three weeks. A shovel, when new, costs 2*s.*

The following appears to be the

YEARLY EXPENDITURE OF THE MASTER SCAVENGERS.

	£	*s.*	*d.*
Wages to working scavengers (as before shown).	9,443	0	0
Wages to 48 bargemen, engaged in unloading the vessels with street-dirt, 4 men to each of 12 wharfs, at 16*s.* weekly wage	1,996	0	0
Keep of 300 horses (26*l.* each) .	7,800	0	0
Wear and tear (say 15 per cent. on capital)	2,250	0	0
Rent of 20 wharfs and yards (average 100*l.* each)	2,000	0	0
Interest on 15,000*l.* capital, at 10 per cent.	1,500	0	0
	£24,989	0	0

I have endeavoured in this estimate to confine myself, as much as possible, to the separate subject of scavengery, but it must be borne in mind that as the large contractors are dustmen as well as scavengers, the great charges for rent and barges cannot be considered as incurred solely on account of the street-dirt trade. Including, then, the payments from parishes, the account will stand thus:—

YEARLY RECEIPTS OF MASTER SCAVENGERS.

From Parishes	£9,450
From Manure, &c.	19,000
Total Income	£28,450
Deduct yearly Expenditure .	25,000
Profit .	£3,450

This gives a profit of nearly 182*l.* to each contractor, if equally apportioned, or a little more than 41*l.* on each contract for street-scavenging

alone, and a profit no doubt affected by circumstances which cannot very well be reduced to figures. The profit may appear small, but it should be remembered that it is *independent* of the profits on the dust.

Of the Contractors' (or Employers') Premises, &c.

At page 171 of the present volume I have described one of the yards devoted to the trade in house-dust, and I have little to say in addition regarding the premises of the contracting or employing scavengers. They are the same places, and the industrious pursuits carried on there, and the division and subdivision of labour, relate far more to the dustmen's department than to the scavengers'. When the produce of the sweeping of the streets has been thrown into the cart, it is so far ready for use that it has not to be sifted or prepared, as has the house-dust, for the formation of brieze, &c., the "mac" being sifted by the purchaser.

These yards or wharfs are far less numerous and better conducted now than they were ten years ago. They are at present fast disappearing from the banks of the Thames (there is, however, one still at Whitefriars and one at Milbank). They are chiefly to be found on the banks of the canals. Some of the principal wharfs near Maiden-lane, St. Pancras, are to be found among unpaven, or ill-paved, or imperfectly macadamized roads, along which run rows of what were once evidently pleasant suburban cottages, with their green porches and their trained woodbine, clematis, jasmine, or monthly roses; these tenements, however, are now occupied chiefly by the labourers at the adjacent stone, coal, lime, timber, dust, and general wharfs. Some of the cottages still presented, on my visits, a blooming display of dahlias and other autumnal flowers; and in one corner of a very large and very black-looking dust-yard, in which rose a huge mound of dirt, was the cottage residence of the man who remained in charge of the wharf all night, and whose comfortable-looking abode was embedded in flowers, blooming luxuriantly. The gay-tinted holly-hocks and dahlias are in striking contrast with the dinginess of the dust-yards, while the canal flows along, dark, sluggish, and muddy, as if to be in keeping with the wharf it washes.

The dust-yards must not be confounded with the "night-yards," or the places where the contents of the cess-pools are deposited, places which, since the passing of the Sanatory Act, are rapidly disappearing.

Upon entering a dust-yard there is generally found a heavy oppressive sort of atmosphere, more especially in wet or damp weather. This is owing to the tendency of charcoal to absorb gases, and to part with them on being saturated with moisture. The cinder-heaps of the several dust-yards, with their million pores, are so many huge gasometers retaining all the offensive gases arising from the putrefying organic matters which usually accompany them, and parting with such gases immediately on a fall of rain. It would be a curious calculation to estimate the quantity of deleterious gas thus poured into the atmosphere after a slight shower.

The question has been raised as to the propriety of devoting some special locality to the purposes of dust-yards, and it is certainly a question deserving public attention.

The chief disposal of the street manure is from barges, sent by the Thames or along the canals, and sold to farmers and gardeners. In the larger wharfs, and in those considered removed from the imputation of "scurfdom," six men, and often but four, are employed to load a barge which contains from 30 to 40 tons. In such cases the dust-yard and the wharf are one and the same place. The contents of these barges are mixed, about one-fourth being "mac," the rest street-mud and dung. This admixture, on board the vessel, is called by the bargemen and the contractors' servants at the wharfs Leicester (properly Læsta, a load). We have the same term at the end of our word bal-*last*.

I am assured by a wharfinger, who has every means of forming a correct judgment, it may be estimated that there are dispatched from the contractors' wharfs twelve barges daily, freighted with street-manure. This is independent of the house-dust barged to the country brick-fields. The weight of the cargo of a barge of manure is about 40 tons; 36 tons being a low average. This gives 3744 barge-loads, or 132,784 tons, or loads, yearly; for it must be recollected that the dirt gathered by pauper labour is dispatched from the contractors' yards or wharfs, as well as that collected by the immediate servants of the contractors. The price per barge-load at the canal, basin, or wharf, in the country parts where agriculture flourishes, is from 5*l.* to 6*l.*, making a total of 20,594*l.* The difference of that sum, and the total given in the table (21,147*l.*) may be accounted for on the supposition that the remainder is sold in the yards and carted away thence. The slop and valueless dirt is not included in this calculation.

Of the Working Scavengers under the Contractors.

I have now to deal with what throughout the whole course of my inquiry into the state of London Labour and the London Poor I have considered the great object of investigation—the condition and characteristics of the working men; and what is more immediately the "labour question," the relation of the labourer to his employer, as to rates of payment, modes of payment, hiring of labourers, constancy or inconstancy of work, supply of hands, the many points concerning wages, perquisites, family work, and parochial or club relief.

First, I shall give an account of the class employment, together with the labour season and earnings of the labourers, or "economical" part of the subject. I shall then pass to the social points, concerning their homes, general expenditure, &c., and then to the more moral and intellectual questions of education, literature, politics, religion,

marriage, and concubinage of the men and of their families. All this will refer, it should be remembered, only to the working scavagers in the honourable or better-paid trade; the cheaper labourers I shall treat separately as a distinct class; the details in both cases I shall illustrate with the statement of men of the class described.

The first part of this multifarious subject appertains to the division of labour. This in the scavaging trade consists rather of that kind of "gang-work" which Mr. Wakefield styles "simple co-operation," or the working together of a number of people at the same thing, as opposed to "complex co-operation," or the working together of a number at *different branches* of the same thing. Simple co-operation is of course the ruder kind; but even this, rude as it appears, is far from being barbaric. "The savages of New Holland," we are told, "never help each other even in the most simple operations; and their condition is hardly superior—in some respects it is inferior—to that of the wild animals which they now and then catch."

As an instance of the advantages of "simple co-operation," Mr. Wakefield tells us that "in a vast number of simple operations performed by human exertion, it is quite obvious that two men working together will do more than four, or four times four men, each of whom should work alone. In the lifting of heavy weights, for example, in the felling of trees, in the gathering of much hay and corn during a short period of fine weather, in draining a large extent of land during the short season when such a work may be properly conducted, in the pulling of ropes on board ship, in the rowing of large boats, in some mining operations, in the erection of a scaffolding for a building, and in the breaking of stones for the repair of a road, so that the whole road shall always be kept in good repair—in all these simple operations, and thousands more, it is absolutely necessary that many persons should work together at the same time, in the same place, and in the same way."

To the above instances of simple co-operation, or gang-working, as it may be briefly styled in Saxon English, Mr. Wakefield might have added dock labour and scavaging.

The principle of complex co-operation, however, is not entirely unknown in the public cleansing trade. This business consists of as many branches as there are distinct kinds of refuse, and these appear to be four. There are (1) the wet and (2) the dry *house*-refuse (or dust and night-soil), and (3) the wet and (4) the dry *street* refuse (or mud and rubbish); and in these four different branches of the one general trade the principle of complex co-operation is found commonly, though not invariably, to prevail.

The difference as to the class employments of the general body of public cleansers—the dustmen, street-sweepers, nightmen, and rubbish carters—seems to be this:—any nightman will work as a dustman or scavager; but it is not all the dustmen and scavagers who will work as nightmen. The reason is almost obvious. The avocations of the dustman and the nightman are in some degree hereditary. A rude man provides for the future maintenance of his sons in the way which is most patent to his notice; he makes the boy share in his own labour, and grow up unfit for anything else.

The regular working scavagers are then generally a distinct class from the working dustmen, and are all paid by the week, while the dustmen are paid by the load. In very wet weather, when there is a great quantity of "slop" in the streets, a dustman is often called upon to lend a helping hand, and sometimes when a working scavager is out of employ, in order to keep himself from want, he goes to a "job of dust work," but seldom from any other cause.

In a parish where there is a crowded population, the dustman's labours consume, on an average, from six to eight hours a day. In scavagery, the average hours of daily work are twelve (Sundays of course excepted), but they sometimes extended to fifteen, and even sixteen hours, in places of great business traffic; while in very fine dry weather, the twelve hours may be abridged by two, three, four, or even more. Thus it is manifest that the consumption of time alone prevents the same working men being simultaneously dustmen and scavagers. In the more remote and quiet parishes, however, and under the management of the smaller contractors, the opposite arrangement frequently exists; the operative is a scavager one day, and a dustman the next. This is not the case in the busier districts, and with the large contractors, unless exceptionally, or on an emergency.

If the scavagers or dustmen have completed their street and house labours in a shorter time than usual, there is generally some sort of employment for them in the yards or wharfs of the contractors, or they may sometimes avail themselves of their leisure to enjoy themselves in their own way. In many parts, indeed, as I have shown, the street-sweeping must be finished by noon, or earlier.

Concerning the *division of labour*, it may be said, that the principle of complex co-operation in the scavaging trade exists only in its rudest form, for the characteristics distinguishing the labour of the working scavagers are far from being of that complicated nature common to many other callings.

As regards the act of sweeping or scraping the streets, the labour is performed by the *gangsman* and his *gang*. The gangsman usually loads the cart, and occasionally, when a number are employed in a district, acts as a foreman by superintending them, and giving directions; he is a working scavager, but has the office of overlooker confided to him, and receives a higher amount of wage than the others.

For the completion of the street-work there are the *one-horse carmen* and the *two-horse carmen*, who are also working scavagers, and so called from their having to load the carts drawn by one or two horses. These are the men who shovel into the cart the dirt swept or scraped to one

side of the public way by the gang (some of it mere slop), and then drive the cart to its destination, which is generally their master's yard. Thus far only does the street-labour extend. The carmen have the care of the vehicles in cleaning them, greasing the wheels, and such like, but the horses are usually groomed by stablemen, who are not employed in the streets.

The division of labour, then, among the working scavagers, may be said to be as follows :—

1st. The *ganger*, whose office it is to superintend the gang, and shovel the dirt into the cart.

2nd. The gang, which consists of from three to ten or twelve men, who sweep in a row and collect the dirt in heaps ready for the ganger to shovel into the cart.

3rd. The carman (one-horse or two-horse, as the case may be), who attends to the horse and cart, brushes the dirt into the ganger's shovel, and assists the ganger in wet sloppy weather in carting the dirt, and then takes the mud to the place where it is deposited.

There is only one *mode of payment* for the above labours pursued among the master scavagers, and that is by the week.

1st. The ganger receives a weekly salary of 18*s.* when working for an "honourable" master; with a "scurf," however, the ganger's pay is but 16*s.* a week.

2nd. The gang receive in a large establishment each 16*s.* per week, but in a small one they usually get from 14*s.* to 15*s.* a week. When working for a small master they have often, by working over hours, to "make eight days to the week instead of six."

3rd. The one-horse carman receives 16*s.* a week in a large, and 15*s.* in a small establishment.

4th. The two-horse carman receives 18*s.* weekly, but is employed only by the larger masters.

On the opposite page I give a table on this point.

Some of these men are paid by the day, some by the week, and some on Wednesdays and Saturdays, perhaps in about equal proportions, the "casuals" being mostly paid by the day, and the regular hands (with some exceptions among the scurfs) once or twice a week. The chance hands are sometimes engaged for a half day, and, as I was told, "jump at a bob and a joey (1*s.* 4*d.*), or at a bob." I heard of one contractor who not unfrequently said to any foreman or gangsman who mentioned to him the applications for work, "O, give the poor devils a turn, if it's only for a day now and then."

Piece-work, or, as the scavagers call it, "by the load," *did* at one time prevail, but not to any great extent. The prices varied, according to the nature and the state of the road, from 2*s.* to 2*s.* 6*d.* the load. The system of piece-work was never liked by the men; it seems to have been resorted to less as a system, or mode of labour, than to insure assiduity on the part of the working scavagers, when a rapid street-cleansing was desirable. It was rather in the favour of the working man's *individual* emoluments than otherwise, as may be shown in the following way. In Battle-bridge, four men collect five loads in dry, and six men seven loads in wet weather. If the average piece hire be 2*s.* 3*d.* a load, it is 2*s.* 9¾*d.* for each of the five men's day's work; if 2*s.* 2*d.* a load, it is 2*s.* 8½*d.* (the regular wage, and an extra halfpenny); if 2*s.*, it is 2*s.* 6*d.*; and if less (which has been paid), the day's wage is not lower than 2*s.* At the lowest rates, however, the men, I was informed, could not be induced to take the necessary pains, as they *would* struggle to "make up half-a-crown;" while, if the streets were scavaged in a slovenly manner, the contractor was sure to hear from his friends of the parish that he was not acting up to his contract. I could not hear of any men now set to piece-work within the precincts of the places specified in the table. This extra work and scamping work are the two great evils of the piece system.

In their payments to their men the contractors show a superiority to the practices of some traders, and even of some dock-companies—the men are never paid at public-houses; the payment, moreover, is always in money. One contractor told me that he would like all his men to be teetotallers, if he could get them, though he was not one himself.

But these remarks refer only to the *nominal* wages of the scavagers; and I find the nominal wages of operatives in many cases are widely different (either from some additions by way of perquisites, &c., or deductions by way of fines, &c., but oftener the latter) from the *actual* wages received by them. Again, the average wages, or gross yearly income of the casually-employed men, are very different from those of the constant hands; so are the gains of a particular individual often no criterion of the general or average earnings of the trade. Indeed I find that the several varieties of wages may be classified as follows:—

1. *Nominal Wages.*—Those said to be paid in a trade.

2. *Actual Wages.*—Those *really* received, and which are equal to the nominal wages, *plus* the additions to, or *minus* the deductions from, them.

3. *Casual Wages.*—The earnings of the men who are only occasionally employed.

4. *Average Casual or Constant Wages.*—Those obtained throughout the year by such as are either occasionally or regularly employed.

5. *Individual Wages.* — Those of particular hands, whether belonging to the scurf or honourable trade, whether working long or short hours, whether partially or fully employed, and the like.

6. *General Wages.*—Or the *average* wages of the whole trade, constant or casual, fully or partially employed, honourable or scurf, long and short hour men, &c., &c., all lumped together and the mean taken of the whole.

Now in the preceding account of the working scavagers' mode and rate of payment I have spoken only of the nominal wages; and in order to arrive at their actual wages we must, as we have seen, ascertain what additions and what deductions are generally made to and from this

TABLE SHOWING THE DIVISION OF LABOUR, MODE AND RATES OF PAYMENT, NATURE OF WORK PERFORMED, TIME UNEMPLOYED, AND AVERAGE EARNINGS OF THE OPERATIVE SCAVAGERS OF LONDON.

OPERATIVE SCAVAGERS.	Mode of Payment.	Rates of Payment.	Nature of Work performed.	Time unemployed during the Year.	Average casual (or constant) gains throughout the Year.
I. *Manual Labourers.*					
A. Better Paid.					
Ganger	By the day.	18s. weekly, and 2s. allowance.	To load the cart and superintend the men.	Not two days during the year.	20s. per week.
Carman (2 horse)	,, ,,	18s. weekly, and 2s. allowance.	To take care of the horses, help to load the cart, and take the dirt and slop to the dust-yard.	Seldom or never out of employment.	20s. ,,
Ditto (1 horse)	,, ,,	16s. weekly, and 2s. allowance.	Ditto. ditto. ditto.	Ditto. ditto.	18s. ,,
Sweepers	,, ,,	16s. weekly, and 2s. allowance.	To sweep the district to which they are sent, and collect the dirt or slop ready for carting away.	About three months during the year.	13s. 6d. ,,
B. Worse Paid.					
Ganger	,, ,,	16s. weekly, and 1s. allowance.	To load the cart and superintend the men.	Three months during the year.	12s. 9d. ,,
Carman	,, ,,	15s. weekly, and 1s. allowance.	To take charge of the horse and cart, help to load the cart, and take the dirt or slop to the dust-yard.	Ditto. ditto.	12s. ,,
Sweepers	,, ,,	15s. weekly, and 1s. allowance.	To sweep the district, collect the dirt or slop ready for carting off, work in the yard, and load the barge.	Ditto. ditto.	12s. ,,
II. *Machine Men.*					
Carman	,, ,,	16s. weekly.	To take charge of the horse and machine, collect the dirt and take it to the yard.	Ditto. ditto.	12s. ,,
Sweepers	,, ,,	16s. weekly.	To sweep where the machine cannot touch, work in the yard, and load the barges.	Ditto. ditto.	12s. ,,
III. *Parish Men.*					
A. Out-door Paupers.					
1. Paid in Money.					
Married men	,, ,,	9s. weekly.	Sweep the streets and courts belonging to the parish, and collect the dirt or slop ready for carting away.	Six months during the year.	4s. 6d. ,,
Single men	,, ,,	6s. weekly.	Ditto. ditto. ditto.	Ditto. ditto.	3s. ,,
2. Paid part in kind.					
Married men	,, ,,	6s. 9d. weekly, and 3 quartern loaves.	Ditto. ditto. ditto.	Ditto. ditto.	3s. 4½d. and 3 quartern loaves weekly.
Single men	,, ,,	5s. and 3 half-quartern loaves.	Ditto. ditto. ditto.	Ditto. ditto.	2s. 6d. and 3 half-quartern loaves weekly.
B. In-door Paupers	All in kind.	Food, lodging, and clothes.	Ditto. ditto. ditto.	....	Food, lodging, and clothes.
IV. *Street-Orderlies.*					
Foreman or Ganger	By the day.	15s. weekly.	Superintend the men and see that their work is done well.		
Sweepers	,, ,,	12s. weekly.	Collect the dirt or slop ready for carting away.		
Barrow men	,, ,,	....	Collect the short dung as it gathers in the district to which they are appointed.		
Barrow boys	,, ,,	....	Ditto. ditto. ditto.

amount. The deductions in the honourable trade are, as usual, inconsiderable.

All the *tools* used by operative scavagers are supplied to them by their employers—the tools being only brooms and shovels; and for this supply there are *no stoppages* to cover the expense.

Neither by *fines* nor by way of *security* are the men's wages reduced.

The *truck system*, moreover, is unknown, and has never prevailed in the trade. I heard of only one instance of an approach to it. A yard foreman, some years ago, who had a great deal of influence with his employer, had a chandler's-shop, managed by his wife, and it was broadly intimated to the men that they must make their purchases there. Complaints, however, were made to the contractor, and the foreman dismissed. One man of whom I inquired did not even know what the "truck system" meant; and when informed, thought they were "pretty safe" from it, as the contractor had nothing which he *could* truck with the men, and if "he polls us hisself," the man said, "he's not likely to let anybody else do it."

There are, moreover, no trade-payments to which the men are subjected; there are no trade-societies among the working men, no benefit nor sick clubs; neither do parochial relief and family labour characterize the regular hands in the honourable trade, although in sickness they may have no other resource.

Indeed, the working scavagers employed by the more honourable portion of the trade, instead of having any deductions made from their nominal wages, have rather additions to them in the form of perquisites coming from the public. These perquisites consist of allowances of beer-money, obtained in the same manner as the dustmen—not through the medium of their employers (though, to say the least, through their sufferance), but from the householders of the parish in which their labours are prosecuted.

The scavagers, it seems, are not required to sweep any places considered "private," nor even to sweep the public foot-paths; and when they *do* sweep or carry away the refuse of a butcher's premises, for instance—for, by law, the butcher is required to do so himself—they receive a gratuity. In the contract entered into by the city scavagers, it is expressly covenanted that no men employed shall accept gratuities from the householders; a condition little or not at all regarded, though I am told that these gratuities become less every year. I am informed also by an experienced butcher, who had at one time a private slaughter-house in the Borough, that, until within these six or seven years, he thought the scavagers, and even the dustmen, would carry away entrails, &c., in the carts, from the butcher's and the knacker's premises, for an allowance.

I cannot learn that the contractors, whether of the honourable or scurf trade, take any advantage of these "allowances." A working scavager receives the same wage, when he enjoys what I heard called in another trade "the height of perquisites," or is employed in a locality where there are no such additions to his wages. I believe, however, that the contracting scavagers let their best and steadiest hands have the best perquisited work.

These perquisites, I am assured, average from 1*s.* to 2*s.* a week, but one butcher told me he thought 1*s.* 6*d.* might be rather too high an average, for a pint of beer (2*d.*) was the customary sum given, and that was, or ought to be, divided among the gang. "In my opinion," he said, "there 'll be no allowances in a year or two." By the amount of these perquisites, then, the scavagers' gains are so far enhanced.

The wages, therefore, of an operative scavager in full employ, and working for the "honourable" portion of the trade, may be thus expressed:—

Nominal weekly wages	16*s.*
Perquisites in the form of allowances for beer from the public	2*s.*
Actual weekly wages	18*s.*

OF THE "CASUAL HANDS" AMONG THE SCAVAGERS.

OF the scavagers proper there are, as in all classes of unskilled labour, that is to say, of labour which requires no previous apprenticeship, and to which any one can "turn his hand" on an emergency, two distinct orders of workmen, "the *regulars* and *casuals*" to adopt the trade terms; that is to say, the labourers consist of those who have been many years at the trade, constantly employed at it, and those who have but recently taken to it as a means of obtaining a subsistence after their ordinary resources have failed. This mixture of *constant* and *casual* hands is, moreover, a necessary consequence of all trades which depend upon the seasons, and in which an additional number of labourers are required at different periods. Such is necessarily the case with dock labour, where an easterly wind prevailing for several days deprives *thousands of work*, and where the change from a foul to a fair wind causes an equally inordinate demand for workmen. The same temporary increase of employment takes place in the agricultural districts at harvesting time, and the same among the hop growers in the picking season; and it will be hereafter seen that there are the same labour fluctuations in the scavaging trade, a greater or lesser number of hands being required, of course, according as the season is wet or dry.

This occasional increase of employment, though a benefit in some few cases (as enabling a man suddenly deprived of his ordinary means of living to obtain "a job of work" until he can "turn himself round"), is generally a most alarming evil in a State. What are the casual hands to do when the extra employment ceases? Those who have paid attention to the subject of dock labour and the subject of casual labour in general, may form some notion of the vast mass of misery that must be generally existing in London. The

Original from HARVARD UNIVERSITY

subject of hop-picking again belongs to the same question. Here are thousands of the very poorest employed only for a few days in the year. What, the mind naturally asks, do they after their short term of honest independence has ceased? With dock labour the poor man's bread depends upon the very winds; in scavaging and in street life generally it depends upon the rain; and in market-gardening, harvesting, hop-picking, and the like, it depends upon the sunshine. How many thousands in this huge metropolis have to look immediately to the very elements for their bread, it is overwhelming to contemplate; and yet, with all this fitfulness of employment we wonder that an extended knowledge of reading and writing does not produce a decrease of crime! We should, however, ask ourselves whether men can stay their hunger with alphabets or grow fat on spelling books; and wanting employment, and consequently food, and objecting to the *incarceration* of the workhouse, can we be astonished—indeed is it not a natural law—that they should help themselves to the property of others?

Concerning the "regular hands" of the contracting scavagers, it may, perhaps, be reasonable to compute that little short of one-half of them have been "to the manner born." The others are, as I have said, what these regular hands call "casuals," or "casualties." As an instance of the peculiar mixture of the regular and casual hands in the scavaging trade, I may state that one of my informants told me he had, at one period, under his immediate direction, fourteen men, of whom the former occupations had been as follows:—

7 Always Scavagers (or dustmen, and six of them nightmen when required).
1 Pot-boy at a public-house (but only as a boy).
1 Stable-man (also nightman).
1 Formerly a pugilist, then a showman's assistant.
1 Navvy.
1 Ploughman (nightman occasionally).
2 Unknown, one of them saying, but gaining no belief, that he had once been a gentleman.

14

In my account of the street orderlies will be given an interesting and elaborate statement of the former avocations, the habits, expenditure, &c., of a body of street-sweepers, 67 in number. This table will be found very curious, as showing what classes of men have been *driven* to street-sweeping, but it will not furnish a criterion of the character of the "regular hands" employed by the contractors.

The "casuals" or the "casualties" (always called among the men "cazzelties"), may be more properly described as men whose employment is accidental, chanceful, or uncertain. The regular hands of the scavagers are apt to designate any new comer, even for a permanence, any sweeper not reared to or versed in the business, a casual ("cazzel"). I shall, however, here deal with the "casual hands," not only as hands newly introduced into the trade, but as men of chanceful and irregular employment.

These persons are now, I understand, numerous in all branches of unskilled labour, willing to undertake or attempt any kind of work, but perhaps there is a greater tendency on the part of the surplus unskilled to turn to scavaging, from the fact that any broken-down man seems to account himself competent to sweep the streets.

To ascertain the number of these casual or outside labourers in the scavaging trade is difficult, for, as I have said, they are willing in their need to attempt any kind of work, and so may be "casuals" in divers departments of unskilled labour.

I do not think that I can better approximate the number of casuals than by quoting the opinion of a contracting scavager familiar with his workmen and their ways. He considered that there were always nearly as many hands on the look-out for a job in the streets, as there were regularly employed at the business by the large contractors; this I have shown to be 262, let us estimate therefore the number of casuals at 200.

According to the table I have given at pp. 213, 214, the number of men regularly or constantly employed at the metropolitan trade is as follows:—

Scavagers employed by large contractors	262
Ditto small contractors	13
Ditto machines	25
Ditto parishes	218
Ditto street-orderlies	60
Total working scavagers in London	578

But the prior table given at pp. 186, 187, shows the number of scavagers employed throughout the metropolis in wet and dry weather (*exclusive of the street-orderlies*) to be as follows:—

Scavagers employed in wet weather	531
Ditto in dry weather	358
Difference	173

Hence it would appear that about one-third less hands are required in the dry than in the wet season of the year. The 170 hands, then, discharged in the dry season are the casually employed men, but the whole of these 170 are not turned adrift immediately they are no longer wanted, some being kept on "odd jobs" in the yard, &c.; nor can that number be said to represent the entire amount of the surplus labour in the trade; but only that portion of it which *does* obtain even casual employment. After much trouble, and taking the average of various statements, it would appear that the number of casualty or quantity of occasional surplus labour in the scavaging trade may be represented at between 200 and 250 hands.

The scavaging trade, however, is not, I am informed, so overstocked with labourers now as it

was formerly. Seven years ago, and from that to ten, there were usually between 200 and 300 hands out of work; this was owing to there being a less extent of paved streets, and comparatively few contractors; the scavaging work, moreover, was "scamped," the men, to use their own phrase, "licking the work over any how," so that fewer hands were required. Now, however, the inhabitants are more particular, I am told, "about the crooks and corners," and require the streets to be swept oftener. Formerly a gang of operative scavagers would only collect six loads of dirt a day, but now a gang will collect nine loads daily. The causes to which the surplus of labourers at present may be attributed are, I find, as follows:—Each operative has to do nearly double the work to what he formerly did, the extra cleansing of the streets having tended not only to employ more hands, but to make each of those employed do more work. The result has, however been followed by an increase in the wages of the operatives; seven years ago the labourers received but 2*s.* a day, and the ganger 2*s.* 6*d.*, but now the labourers receive 2*s.* 8*d.* a day, and the ganger 3*s.*

In the city the men have to work very long hours, sometimes as many as 18 hours a day without any extra pay. This practice of overworking is, I find, carried on to a great extent, even with those master scavagers who pay the regular wages. One man told me that when he worked for a certain large master, whom he named, he has many times been out at work 28 hours in the wet (saturated to the skin) without having any rest. This plan of overworking, again, is generally adopted by the small masters, whose men, after they have done a regular day's labour, are set to work in the yard, sometimes toiling 18 hours a day, and usually not less than 16 hours daily. Often so tired and weary are the men, that when they rise in the morning to pursue their daily labour, they feel as fatigued as when they went to bed. "Frequently," said one of my informants, "have I gone to bed so worn out, that I haven't been able to sleep. However" (he added), "there is the work to be done, and we must do it or be off."

This system of overwork, especially in those trades where the quantity of work to be done is in a measure fixed, I find to be a far more influential cause of surplus labour than "over population." The mere number of labourers in a trade is, *per se*, no criterion as to the quantity of labour employed in it; to arrive at this three things are required:—

(1) The number of hands;
(2) The hours of labour;
(3) The rate of labouring;

for it is a mere point of arithmetic, that if the hands in the scavaging trade work 18 hours a day, there must be one-third less men employed than there otherwise would, or in other words one-third of the men who are in work must be thus deprived of it. This is one of the crying evils of the day, and which the economists, filled as they are with their over-population theories, have entirely overlooked.

There are 262 men employed in the Metropolitan Scavaging Trade; one-half of these at the least may be said to work 16 hours per diem instead of 12, or one-third longer than they should; so that if the hours of labour in this trade were restricted to the usual day's work, there would be employment for one-sixth more hands, or nearly 50 individuals extra.

The other causes of the present amount of surplus labour are—

The many hands thrown out of employment by the discontinuance of railway works.

A less demand for unskilled labour in agricultural districts, or a smaller remuneration for it.

A less demand for some branches of labour (as ostlers, &c.), by the introduction of machinery (applied to roads), or through the caprices of fashion.

It should, however, be remembered, that men often found their opinions of such causes on prejudices, or express them according to their class interests, and it is only a few employers of unskilled labourers who care to inquire into the antecedent circumstances of men who ask for work.

As regards the population part of the question, it cannot be said that the surplus labour of the scavaging trade is referable to any inordinate increase in the families of the men. Those who are married appear to have, on the average, four children, and about one-half of the men have no family at all. Early marriages are by no means usual. Of the casual hands, however, full three-fourths are married, and one-half have families.

There are not more than ten or a dozen Irish labourers who have taken to the scavaging, though several have "tried it on;" the regular hands say that the Irish are too lazy to continue at the trade; but surely the labour of the hodman, in which the Irish seem to delight, is sufficient to disprove this assertion, be the cause what it may. About one-fourth of the scavagers entering the scavaging trade as casual hands have been agricultural labourers, and have come up to London from the several agricultural districts in quest of work; about the same proportion appear to have been connected with horses, such as ostlers, carmen, &c.

The *brisk and slack seasons* in the scavaging trade depend upon the state of the weather. In the depth of winter, owing to the shortness of the days, more hands are usually required for street cleansing; but a "clear frost" renders the scavager's labour in little demand. In the winter, too, his work is generally the hardest, and the hardest of all when there is snow, which soon becomes mud in London streets; and though a continued frost is a sort of lull to the scavagers' labour, after "a great thaw" his strength is taxed to the uttermost; and then, indeed, new hands have had to be put on. At the West End, in the height of the summer, which is usually the height of the fashionable season, there is again a more than usual requirement of scavaging industry in wet weather; but perhaps the greatest exercise of such industry is after a series of the fogs peculiar

to the London atmosphere, when the men cannot *see* to sweep. The table I have given shows the influence of the weather, as on wet days 531 men are employed, and on dry days only 358; this, however, does not influence the Street-Orderly system, as under it the men are employed every day, unless the weather make it an actual impossibility.

According to the rain table given at p. 202, there would appear to be, on an average of 23 years, 178 wet days in London out of the 365, that is to say, about 100 in every 205 days are "rainy ones." The months having the greatest and least number of wet days are as follows:—

	No. of days in the month in which rain falls.
December	17
July, August, October	16
February, May, November	15
January, April	14
March, September	12
June	11

Hence it would appear that June is the least and December the most showery month in the course of the year; the greatest *quantity* of rain falling in any month is, however, in October, and the least quantity in March. The number of wet days, and the quantity of rain falling in each half of the year, may be expressed as follows:—

	Total in No. of wet days.	Total depth of rain falling in inches.
The first six months in the year ending June there are	84	10
The second six months in the year ending December there are	93	14

Hence we perceive that the quantity of work for the scavagers would fluctuate in the first and last half of the year in the proportion of 10 to 14, which is very nearly in the ratio of 358 to 531, which are the numbers of hands given in table pp. 186, 187, as those employed in wet and dry weather throughout the metropolis.

If, then, the labour in the scavaging trade varies in the proportion of 5 to 7, that is to say, that 5 hands are required at one period and 7 at another to execute the work, the question consequently becomes, how do the 2 casuals who are discharged out of every 7 obtain their living when the wet season is over?

When a scavager is out of employ, he seldom or never applies to the parish; this he does, I am informed, only when he is fairly "beaten out" through sickness or old age, for the men "hate the thought of going to the big house" (the union workhouse). An unemployed operative scavager will go from yard to yard and offer his services to do anything in the dust trade or any other kind of employment in connection with dust or scavaging.

Generally speaking, an operative scavager who is casually employed obtains work at that trade for six or eight months during the year, and the remaining portion of his time is occupied either at rubbish-carting or brick-carting, or else he gets a job for a month or two in a dust-yard.

Many of these men seem to form a body of street-jobbers or operative labourers, ready to work at the docks, to be navvies (when strong enough), bricklayers' labourers, street-sweepers, carriers of trunks or parcels, window-cleaners, errand-goers, porters, and (occasionally) nightmen. Few of the class seem to apply themselves to trading, as in the costermonger line. They are the loungers about the boundaries of trading, but seldom take any onward steps. The street-sweeper of this week, a "casual" hand, may be a rubbish-carter or a labourer about buildings the next, or he may be a starving man for days together, and the more he is starving with the less energy will he exert himself to obtain work: "it's not in" a starving or ill-fed man to exert himself otherwise than what may be called *passively;* this is well known to all who have paid attention to the subject. The want of energy and carelessness begotten by want of food was well described by the tinman, at p. 355 in vol. i.

One casual hand told me that last year he was out of work altogether three months, and the year before not more than six weeks, and during the six weeks he got a day's work sometimes at rubbish carting and sometimes at loading bricks. Their wives are often employed in the yards as sifters, and their boys, when big enough, work also at the heap, either in carrying off, or else as fillers-in; if there are any girls, one is generally left at home to look after the rest and get the meals ready for the other members of the family. If any of the children go to school, they are usually sent to a ragged school in the neighbourhood, though they seldom attend the school more than two or three times during the week.

The additional hands employed in wet weather are either men who at other times work in the yards, or such as have their "turns" in street-sweeping, if not regularly employed. There appears, however, to be little of system in the arrangement. If more hands are wanted, the gangsman, who receives his orders from the contractor or the contractor's managing man, is told to put on so many new hands, and over-night he has but to tell any of the men at work that Jack, and Bob, and Bill will be wanted in the morning, and they, if not employed in other work, appear accordingly.

There is nothing, however, which can be designated a *labour market* appertaining to the trade. No "house of call," no trade society. If men seek such employment, they must apply at the contractor's premises, and I am assured that poor men not unfrequently ask the scavagers whom they see at work in the streets where to apply "for a job," and sometimes receive gruff or abusive replies. But though there is nothing like a labour market in the scavager's trade, the employers have not to "look out" for men, for I was told by one of their foremen, that he would undertake, if necessary, which it never was, by a mere "round of the docks," to select 200 new hale men, of all classes, and strong ones, too, if properly fed, who

Original from HARVARD UNIVERSITY

in a few days would be tolerable street-sweepers. It is a calling to which agricultural labourers are glad to resort, and a calling to which *any* labourer or any mechanic may resort, more especially as regards sweeping or scraping, apart from shovelling, which is regarded as something like the high art of the business.

We now come to estimate the earnings of the casual hands, whose yearly incomes must, of course, be very different from those of the regulars. The *constant* weekly wages of any workman are of course the average of his casual—and hence we shall find the wages of those who are *regularly* employed far exceed those of the *occasionally* employed men :—

	£	s.	d.
Nominal yearly wages at scavaging for 25 weeks in the year, at 16s. per week	20	16	0
Perquisites for 26 weeks, at 2s. .	2	12	0
Actual yearly wages at scavaging .	23	8	0
Nominal and actual weekly wages at rubbish carting for 20 weeks in the year, at 12s.	12	0	0
Unemployed six weeks in the year.	0	0	0
Gross yearly earnings	35	8	0
Average casual or constant weekly wages throughout the year . .		15	4½

Hence the difference between the earnings of the casual and the regular hand would appear to be one-sixth. But the great evil of all casual labour is the uncertainty of the income—for where there is the greatest chance connected with an employment, there is not only the greatest necessity for providence, but unfortunately the greatest tendency to improvidence. It is only when a man's income becomes regular and fixed that he grows thrifty, and lays by for the future; but where all is chance-work there is but little ground for reasoning, and the accident which assisted the man out of his difficulties at one period is continually expected to do the same good turn for him at another. Hence the casual hand, who passes the half of the year on 18s., and twenty weeks on 12s., and *six weeks on nothing*, lives a life of excess both ways—of excess of "guzzling" when in work, and excess of privation when out of it—oscillating, as it were, between surfeit and starvation.

A man who had worked in an iron-foundry, but who had "lost his work" (I believe through some misconduct) and was glad to get employment as a street-sweeper, as he had a good recommendation to a contractor, told me that "the misery of the thing" was the want of regular work. "I've worked," he said, "for a good master for four months an end at 2s. 8d. a day, and they were prime times. Then I hadn't a stroke of work for a fortnight, and very little for two months, and if my wife hadn't had middling work with a laundress we might have starved, or I might have made a hole in the Thames, for it's no good living to be miserable and feel you can't help yourself any how. We was sometimes half-starved as it was. I'd rather at this minute have regular work at 10s. a week all the year round, than have chance-work that I could earn 20s. a week at. I once had 15s. in relief from the parish, and a doctor to attend us, when my wife and I was both laid up sick. O, there's no difference in the way of doing the work, whatever wages you're on for; the streets must be swept clean, of course. The plan's the same, and there's the same sort of management, any how."

Statement of a "Regular Scavager."

The following statement of his business, his sentiments, and, indeed, of the subjects which concerned him, or about which he was questioned, was given to me by a street-sweeper, so he called himself, for I have found some of these men not to relish the appellation of "scavager." He was a short, sturdy, somewhat red-faced man, without anything particular in his appearance to distinguish him from the mass of mere labourers, but with the sodden and sometimes dogged look of a man contented in his ignorance, and—for it is not a very uncommon case—rather proud of it.

"I don't know how old I am," he said—I have observed, by the by, that there is not any excessive vulgarity in these men's tones or accent so much as grossness in some of their expressions—"and I can't see what that consarns any one, as I's old enough to have a jolly rough beard, and so can take care of myself. I should think so. My father was a sweeper, and I wanted to be a waterman, but father—he hasn't been dead long—didn't like the thoughts on it, as he said they was all drownded one time or 'nother; so I ran away and tried my hand as a Jack-in-the-water, but I was starved back in a week, and got a h—— of a clouting. After that I sifted a bit in a dust-yard, and helped in any way; and I was sent to help at and larn honey-pot and other pot making, at Deptford; but honey-pots was a great thing in the business. Master's foreman married a relation of mine, some way or other. I never tasted honey, but I've heered it's like sugar and butter mixed. The pots was often wanted to look like foreign pots; I don't know nothing what was meant by it; some b—— dodge or other. No, the trade didn't suit me at all, master, so I left. I don't know why it didn't suit me; cause it didn't. Just then, father had hurt his hand and arm, in a jam again' a cart, and so, as I was a big lad, I got to take his place, and gave every satisfaction to Mr. ——. Yes, he was a contractor and a great man. I can't say as I knows how contracting's done; but it's a bargain atween man and man. So I got on. I'm now looked on as a stunning good workman, I can tell you.

"Well, I can't say as I thinks sweeping the streets is hard work. I'd rather sweep two hours than shovel one. It tires one's arms and back so, to go on shovelling. You can't change, you see, sir, and the same parts keeps getting gripped more and more. Then you must mind your eye, if you're

Original from HARVARD UNIVERSITY

shovelling slop into a cart, perticler so; or some feller may run off with a complaint that he 's been splashed o' purpose. *Is* a man ever splashed o' purpose? No, sir, not as I knows on, in coorse not. [Laughing.] Why should he?

"The streets *must* be done as they 're done now. It always was so, and will always be so. Did I ever hear what London streets were like a thousand years ago? It's nothing to me, but they must have been like what they is now. Yes, there was always streets, or how was people that has tin to get their coals taken to them, and how was the public-houses to get their beer? It 's talking nonsense, talking that way, a-asking sich questions." [As the scavager seemed likely to lose his temper, I changed the subject of conversation.]

"Yes," he continued, "I have good health. I never had a doctor but twice; once was for a hurt, and the t'other I won't tell on. Well, I think nightwork 's healthful enough, but I 'll not say so much for it as you may hear some on 'em say. I don't like it, but I do it when I 's obligated under a necessity. It pays one as overwork; and werry like more one 's in it, more one may be suited. I reckon no men works harder nor sich as me. O, as to poor journeymen tailors and sich like, I knows they 're stunning badly off, and many of their masters is the hardest of beggars. I have a nephew as works for a Jew slop, but I don't reckon that *work;* anybody might do it. You think not, sir? Werry well, it 's all the same. No, I won't say as I could make a veskit, but I 've sowed my own buttons on to one afore now.

"Yes, I've heered on the Board of Health. They 've put down some night-yards, and if they goes on putting down more, what 's to become of the night-soil? I can't think what they 're up to; but if they don't touch wages, it may be all right in the end on it. I don't know that them there consarns does touch wages, but one 's naterally afeard on 'em. I could read a little when I was a child, but I can't now for want of practice, or I might know more about it. I yarns my money gallows hard, and requires support to do hard work, and if wages goes down, one 's strength goes down. I'm a man as understands what things belongs. I was once out of work, through a mistake, for a good many weeks, perhaps five or six or more; I larned then what short grub meant. I got a drop of beer and a crust sometimes with men as I knowed, or I might have dropped in the street. What did I do to pass my time when I was out of work? Sartinly the days seemed wery long; but I went about and called at dust-yards, till I didn't like to go too often; and I met men I know'd at tap-rooms, and spent time that way, and axed if there was any openings for work. I 've been out of collar odd weeks now and then, but when this happened, I'd been on slack work a goodish bit, and was bad for rent three weeks and more. My rent was 2*s.* a week then; its 1*s.* 9*d.* now, and my own traps.

"No, I can't say I was sorry when I was forced to be idle that way, that I hadn't kept up my reading, nor tried to keep it up, because I couldn't then have settled down my mind to read; I know I couldn't. I likes to hear the paper read well enough, if I 's resting; but old Bill, as often wolunteers to read, has to spell the hard words so, that one can't tell what the devil he 's reading about. I never heers anything about books; I never heered of Robinson Crusoe, if it wasn't once at the Wic. [Victoria Theatre]; I think there was some sich a name there. He lived on a deserted island, did he, sir, all by hisself? Well, I think, now you mentions it, I have heered on him. But one needn't believe all one hears, whether out of books or not. I don't know much good that ever anybody as I knows ever got out of books; they 're fittest for idle people. Sartinly I 've seen working people reading in coffee-shops; but they might as well be resting theirselves to keep up their strength. Do I think so? I'm sure on it, master. I sometimes spends a few browns a-going to the play; mostly about Christmas. It 's werry fine and grand at the Wic., that 's the place I goes to most; both the pantomimers and t' other things is werry stunning. I can't say how much I spends a year in plays; I keeps no account; perhaps 5*s.* or so in a year, including expenses, sich as beer, when one goes out after a stopper on the stage. I don't keep no accounts of what I gets, or what I spends, it would be no use; money comes and it goes, and it often goes a d——d sight faster than it comes; so it seems to me, though I ain't in debt just at this time.

"I never goes to any church or chapel. Sometimes I hasn't clothes as is fit, and I s'pose I couldn't be admitted into sich fine places in my working dress. I was once in a church, but felt queer, as one does in them strange places, and never went again. They 're fittest for rich people. Yes, I 've heered about religion and about God Almighty. *What* religion have I heered on? Why, the regular religion. I 'm satisfied with what I knows and feels about it, and that 's enough about it. I came to tell you about trade and work, because Mr. —— told me it might do good; but religion hasn't nothing to do with it. Yes, Mr. —— 's a good master, and a religious man; but I 've known masters as didn't care a d—n for religion, as good as him; and so you see it comes to much the same thing. I cares nothing about politics neither; but I 'm a chartist.

"I 'm not a married man. I was a-going to be married to a young woman as lived with me a goodish bit as my housekeeper" [this he said very demurely]; "but she went to the hopping to yarn a few shillings for herself, and never came back. I heered that she 'd taken up with an Irish hawker, but I can't say as to the rights on it. Did I fret about her? Perhaps not; but I was wexed.

"I 'm sure I can't say what I spends my wages in. I sometimes makes 12*s.* 6*d.* a week, and sometimes better than 21*s.* with night-work. I suppose grub costs 1*s.* a day, and beer 6*d.*; but I keeps no accounts. I buy ready-cooked meat; often cold b'iled beef, and eats it at any tap-room. I have meat every day; mostly more than once a

day. Wegetables I don't care about, only ingans and cabbage, if you can get it smoking hot, with plenty of pepper. The rest of my tin goes for rent and baccy and togs, and a little drop of gin now and then."

The statement I have given is sufficiently explicit of the general opinions of the "regular scavagers" concerning literature, politics, and religion. On these subjects the great majority of the regular scavagers have no opinions at all, or opinions distorted, even when the facts seem clear and obvious, by ignorance, often united with its nearest of kin, prejudice and suspiciousness. I am inclined to think, however, that the man whose narrative I noted down was more dogged in his ignorance than the body of his fellows. All the intelligent men with whom I conversed, and whose avocations had made them familiar for years with this class, concurred in representing them as grossly ignorant.

This description of the scavagers' ignorance, &c., it must be remembered, applies only to the "regular hands." Those who have joined the ranks of the street-sweepers from other callings are more intelligent, and sometimes more temperate.

The system of concubinage, with a great degree of fidelity in the couple living together without the sanction of the law—such as I have described as prevalent among the costermongers and dustmen—is also prevalent among the regular scavagers.

I did not hear of habitual unkindness from the parents to the children born out of wedlock, but there is habitual neglect of all or much which a child should be taught—a neglect growing out of ignorance. I heard of two scavagers with large families, of whom the treatment was sometimes very harsh, and at others mere petting.

Education, or rather the ability to read and write, is not common among the adults in this calling, so that it cannot be expected to be found among their children. Some labouring men, ignorant themselves, but not perhaps constituting a class or a clique like the regular scavagers, try hard to procure for their children the knowledge, the want of which they usually think has barred their own progress in life. Other ignorant men, mixing only with "their own sort," as is generally the case with the regular scavagers, and in the several branches of the business, often think and say that what *they* did without their children could do without also. I even heard it said by one scavager that it wasn't right a child should ever think himself wiser than his father. A man who knew, in the way of his business as a private contractor for night-work, &c., a great many regular scavagers, "ran them over," and came to the conclusion that about four or five out of twenty could read, ill or tolerably well, and about three out of forty could write. He told me, moreover, that one of the most intelligent fellows generally whom he knew among them, a man whom he had heard read well enough, and always understood to be a tolerable writer, the other day brought a letter from his son, a soldier abroad with his regiment in Lower Canada, and requested my informant to read it to him, as "that kind of writing," although plain enough, was "beyond him." The son, in writing, had availed himself of the superior skill of a corporal in his company, so that the letter, on family matters and feelings, was written by deputy and read by deputy. The costermongers, I have shown, when themselves unable to read, have evinced a fondness for listening to exciting stories of courts and aristocracies, and have even bought penny periodicals to have their contents read to them. The scavagers appear to have no taste for this mode of enjoying themselves; but then their leisure is far more circumscribed than that of the costermongers.

It must be borne in mind that I have all along spoken of the regular (many of them hereditary) scavagers employed by the more liberal contractors.

There are yet accounts of habitations, statements of wages, &c., &c., to be given, in connection with men working for the honourable masters, before proceeding to the scurf-traders.

The working scavagers usually reside in the neighbourhood of the dust-yards, occupying "second-floor backs," kitchens (where the entire house is sublet, a system often fraught with great extortion), or garrets; they usually, and perhaps always, when married, or what they consider "as good," have their own furniture. The rent runs from 1*s*. 6*d*. to 2*s*. 3*d*. weekly, an average being 1*s*. 9*d*. or 1*s*. 10*d*. One room which I was in was but barely furnished,—a sort of dresser, serving also for a table; a chest; three chairs (one almost bottomless); an old turn-up bedstead, a Dutch clock, with the minute-hand broken, or as the scavager very well called it when he saw me looking at it, "a stump;" an old "corner cupboard," and some pots and domestic utensils in a closet without a door, but retaining a portion of the hinges on which a door had swung. The rent was 1*s*. 10*d*., with a frequent intimation that it ought to be 2*s*. The place was clean enough, and the scavager seemed proud of it, assuring me that his old woman (wife or concubine) was "a good sort," and kept things as nice as ever she could, washing everything herself, where "other old women lushed." The only ornaments in the room were three profiles of children, cut in black paper and pasted upon white card, tacked to the wall over the fire-place, for mantel-shelf there was none, while one of the three profiles, that of the eldest child (then dead), was "framed," with a glass, and a sort of bronze or "cast" frame, costing, I was told, 15*d*. This was the apartment of a man in regular employ (with but a few exceptions).

Another scavager with whom I had some conversation about his labours as a nightman, for he was both, gave me a full account of his own diet, which I find to be sufficiently specific as to that of his class generally, but only of the regular hands.

The diet of the regular working scavager (or nightman) seems generally to differ from that of mechanics, and perhaps of other working men, in the respect of his being fonder of salt and *strong-flavoured* food. I have before made the same

remark concerning the diet of the poor generally. I do not mean, however, that the scavagers are fond of such animal food as is called "high," for I did not hear that nightmen or scavagers were more tolerant of what approached putridity than other labouring men, and, despite their calling, might sicken at the rankness of some haunches of venison; but they have a great relish for highly-salted cold boiled beef, bacon, or pork, with a saucer-full of red pickled cabbage, or dingy-looking pickled onions, or one or two big, strong, raw onions, of which most of them seem as fond as Spaniards of garlic. This sort of meat, sometimes profusely mustarded, is often eaten in the beer-shops with thick "shives" of bread, cut into big mouthfuls with a clasp pocket-knife, while vegetables, unless indeed the beer-shop can supply a plate of smoking hot potatoes, are uncared for. The drink is usually beer. The same style of eating and the same kind of food characterize the scavager and nightman, when taking his meal at home with his wife or family; but so irregular, and often of necessity, are these men's hours, that they may be said to have no homes, merely places to sleep or dose in.

A working scavager and nightman calculated for me his expenses in eating and drinking, and other necessaries, for the previous week. He had earned 15*s.*, but 1*s.* of this went to pay off an advance of 5*s.* made to him by the keeper of a beer-shop, or, as he called it, a "jerry."

	Daily.	Weekly.	
	d.	*s.*	*d.*
Rent of an unfurnished room		1	9
Washing (average)			3
[The man himself washed the dress in which he worked, and generally washed his own stockings.]			
Shaving (when twice a week)			1
Tobacco	1		7
[Short pipes are given to these men at the beer-shops, or public-houses which they "use."]			
Beer	4	2	4
[He usually spent more than 4*d.* a day in beer, he said, "it was only a pot;" but this week more beer than usual had been given to him in nightwork.]			
Gin	2	1	2
[The same with gin.]			
Cocoa (pint at a coffee-shop) .	1½		10½
Bread (quartern loaf) (sometimes 5½*d.*)	6	3	6
Boiled salt beef (¾ lb. or ½ lb. daily, "as happened," for two meals, 6*d.* per pound, average	4	2	4
Pickles or Onions	0¼		1¾
Butter			1
Soap			1
		13	2¼

Perhaps this informant was excessive in his drink. I believe he was so; the others not drinking so much regularly. The odd 9*d.*, he told me, he paid to "a snob," because he said he was going to send his half-boots to be mended.

This man informed me he was a "widdur," having lost his old 'oman, and he got all his meals at a beer or coffee-shop. Sometimes, when he was a street-sweeper by day and a nightman by night, he had earned 20*s.* to 22*s.*; and then he could have his pound of salt meat a day, for *three* meals, with a "baked tatur or so, when they was in." I inquired as to the apparently low charge of 6*d.* per pound for cooked meat, but I found that the man had stated what was correct. In many parts good boiled "brisket," fresh cut, is 7*d.* and 8*d.* per lb., with mustard into the bargain; and the cook-shop keepers (not the eating-house people) who sell boiled hams, beef, &c., in retail, but not to be eaten on the premises, vend the hard remains of a brisket, and sometimes of a round, for 6*d.*, or even less (also with mustard), and the scavagers like this better than any other food. In the brisk times my informant sometimes had "a hot cut" from a shop on a Sunday, and a more liberal allowance of beer and gin. If he had any piece of clothing to buy he always bought it at once, before his money went for other things. These were his proceedings when business was brisk.

In slacker times his diet was on another footing. He then made his supper, or second meal, for tea be seldom touched, on "fagots." This preparation of baked meats costs 1*d.* hot—but it is seldom sold hot except in the evening—and ¾*d.*, or more frequently two for 1½*d.*, cold. It is a sort of cake, roll, or ball, a number being baked at a time, and is made of chopped liver and lights, mixed with gravy, and wrapped in pieces of pig's caul. It weighs six ounces, so that it is unquestionably a cheap, and, to the scavager, a savoury meal; but to other nostrils its odour is not seductive. My informant regretted the capital fagots he used to get at a shop when he worked in Lambeth; superior to anything he had been able to meet with on the Middlesex side of the water. Or he dined off a saveloy, costing 1*d.*, and bread; or bought a pennyworth of strong cheese, and a farthing's worth of onions. He would further reduce his daily expenditure on cocoa (or coffee sometimes) to 1*d.*, and his bread to three-quarters of a loaf. He ate, however, in average times, a quarter of a quartern loaf to his breakfast (sometimes buying a halfpennyworth of butter), a quarter or more to his dinner, the same to his supper, and the other, with an onion for a relish, to his beer. He was a great bread eater, he said; but sometimes, if he slept in the daytime, half a loaf would "stand over to next day." He was always hungriest when at work among the street-mud or night-soil, or when he had finished work.

On my asking him if he meant that he partook of the meals he had described daily, "he answered "no," but that was *mostly* what he had; and if he bought a bit of cold boiled, or

HARVARD UNIVERSITY

even roast pork, "what offered cheap," the expense was about the same. When he was drinking, and he did "make a break sometimes," he ate nothing, and "wasn't inclined to," and he seemed rather to plume himself on this, as a point of economy. He had tasted fruit pies, but cared nothing for them; but liked four penn'orth of a hot meat or giblet pie on a Sunday. Batter-pudding he only liked if smoking hot; and it was "uncommon improved," he said, "with an ingan!" Rum he preferred to gin, only it was dearer, but most of the scavagers, he thought, liked Old Tom (gin) best; but "they was both good."

Of the drinking of these men I heard a good deal, and there is no doubt that some of them tope hard, and by their conduct evince a sort of belief that the great end of labour is beer. But it must be borne in mind that if inquiries are made as to the man best adapted to give information concerning any rude calling (especially), some talkative member of the body of these working men, some pot-house hero who has pursuaded himself and his ignorant mates that he is an oracle, is put forward. As these men are sometimes, from being trained to, and long known in their callings, more prosperous than their fellows, their opinions seem ratified by their circumstances. But in such cases, or in the appearance of such cases, it has been my custom to make subsequent inquiries, or there might be frequent misleadings, were the statements of these men taken as typical of the feelings and habits of the *whole* body. The statement of the working scavager given under this head is unquestionably typical of the character of a portion of his co-workers, and more especially of what was, and in the sort of hereditary scavagers I have spoken of *is*, the character of the regular hands. There are now, however, many checks to prolonged indulgence in "lush," as every man of the ruder street-sweeping class *will* call it. The contractors must be served regularly; the most indulgent will not tolerate any unreasonable absence from work, so that the working scavagers, at the jeopardy of their means of living, must leave their carouse at an hour which will permit them to rise soon enough in the morning.

The beer which these men imbibe, it should be also remembered, they regard as a proper part of their diet, in the same light, indeed, as they regard so much bread, and that among them the opinion is almost universal, that beer is necessary to "keep up their strength;" there are a few teetotallers belonging to the class; one man thought he *knew* five, and had *heard* of five others.

I inquired of the landlord of a beer-shop, frequented by these men, as to their potations, but he wanted to make it appear that they took a half-pint, *now and then*, when thirsty! He was evidently tender of the character of his customers. The landlord of a public house also frequented by them informed me that he really could not say what they expended in beer, for labourers of all kinds "used his tap," and as all tap-room liquor was paid for on delivery in his and all similar establishments, he did not know the quantity supplied to any particular class. He was satisfied these men, as a whole, drank less than they did at one time; though he had no doubt some (he seemed to know no distinctions between scavagers, dustmen, and nightmen) spent 1*s.* a day in drink. He knew one scavager who was dozing about not long since for nearly a week, "sleepy drunk," and the belief was that he had "found something." The absence of all accounts prevents my coming to anything definite on this head, but it seems positive that these men drink less than they did. The landlord in question thought the statement I have given as to diet and drink perfectly correct for a regular hand in good earnings. I am assured, however, and it is my own opinion, after long inquiry, that one-third of their earnings is spent in drink.

Of the Influence of Free Trade on the Earnings of the Scavagers.

As regards the influence of Free Trade upon the scavaging business, I could gain little or no information from the body of street-sweepers, because they have never noticed its operation, and the men, with the exception of such as have sunk into street-sweeping from better-informed conditions of life, know nothing about it. Among *all*, however, I have heard statements of the blessing of cheap bread; always cheap *bread*. "There 's nothing like bread," say the men, "it 's not all poor people can get meat; but they *must* get bread." Cheap food all labouring men pronounce a blessing, as it unquestionably is, but "somehow," as a scavager's carman said to me, "the thing ain't working as it should."

In the course of the present and former inquiries among unskilled labourers, street-sellers, and costermongers, I have found the great majority of the more intelligent declare that Free Trade had not worked well for them, because there were more labourers and more street-sellers than were required, for each man to live by his toil and traffic, and because the numbers increased yearly, and the demand for their commodities did not increase in proportion. Among the ignorant, I heard the continual answers of, "I can't say, sir, what it 's owing to, that I 'm so bad off;" or "Well, I can't tell anything about that."

It is difficult to state, however, without positive inquiry, whether this extra number of hands be due to diminished employment in the agricultural districts, since the repeal of the Corn Laws, or whether it be due to the insufficiency of occupation generally for the increasing population. One thing at least is evident, that the increase of the trades alluded to cannot be said to arise directly from diminished agricultural employment, for but few farm labourers have entered these businesses since the change from Protection to Free Trade. If, therefore, Free-Trade principles *have* operated injuriously in reducing the work of the unskilled labourers, street-sellers, and the poorer classes generally, it can have done so only *indirectly;* that is to say, by throwing a mass of displaced country labour into the towns, and so

displacing other labourers from their ordinary occupations, as well as by decreasing the wages of working-men generally. Hence it becomes almost impossible, I repeat, to tell whether the increasing difficulty that the poor experience in living by their labour, is a consequence or merely a concomitant of the repeal of the Corn Laws; if it be a consequence, of course the poor are no better for the alteration; if, however, it be a coincidence rather than a necessary result of the measure, the circumstances of the poor are, of course, as much improved as they would have been impoverished provided that measure had never become law. I candidfy confess I am as yet without the means of coming to any conclusion on this part of the subject.

Nor can it be said that in the scavagers' trade wages have in any way declined since the repeal of the Corn Laws; so that were it not for the difficulty of obtaining employment among the *casual* hands, this class must be allowed to have been considerable gainers by the reduction in the price of food, and even as it is, the *constant* hands must be acknowledged to be so.

I will now endeavour to reduce to a tabular form such information as I could obtain as to the expenditure of the labourer in scavaging before and after the establishment of Free Trade. I inquired, the better to be assured of the accuracy of the representations and accounts I received from labourers, the price of meat then and now. A butcher who for many years has conducted a business in a populous part of Westminster and in a populous suburb, supplying both private families with the best joints, and the poor with their "little bits" their "block ornaments" (meat in small pieces exposed on the chopping-block), their purchases of liver, and of beasts' heads. In 1845, the year I take as sufficiently prior to the Free-Trade era, my informant from his recollection of the state of his business and from consulting his books, which of course were a correct guide, found that for a portion of the year in question, mutton was as much as 7½*d.* per lb. (Smithfield prices), now the same quality of meat is but 5*d.* This, however, was but a temporary matter, and from causes which sometimes are not very ostensible or explicable. Taking the butcher's trade that year as a whole, it was found sufficiently conclusive, that meat was generally 1*d.* per lb. higher then than at present. My informant, however, was perfectly satisfied that, although situated in the same way, and with the same class of customers, he did *not* sell so much meat to the poor and labouring classes as he did five or six years ago, *he believed not by one-eighth,* although perhaps "pricers of his meat" among the poor were more numerous. For this my informant accounted by expressing his conviction that the labouring men spent their money in drink more than ever, and were a longer time in recovering from the effects of tippling. This supposition, from what I have observed in the course of the present inquiry, is negatived by facts.

Another butcher, also supplying the poor, said they bought less of him; but he could not say exactly to what extent, perhaps an eighth, and he attributed it to less work, there being no railways about London, fewer buildings, and less general employment. About the wages of the labourers he could not speak as influencing the matter. From this tradesmen also I received an account that meat generally was 1*d.* per lb. higher at the time specified. Pickled Australian beef was four or five years ago very low—3*d.* per lb.—salted and prepared, and "swelling" in hot water, but the poor "couldn't eat the stringy stuff, for it was like pickled ropes." "It's better now," he added, "but it don't sell, and there's no nourishment in such beef."

But these tradesmen agreed in the information that poor labourers bought less meat, while one pronounced Free Trade a blessing, the other declared it a curse. I suggested to each that cheaper fish might have something to do with a smaller consumption of butcher's meat, but both said that cheap fish was the great thing for the Irish and the poor needle-women and the like, who were never at any time meat eaters.

From respectable bakers I ascertained that bread might be considered 1*d.* a quartern loaf dearer in 1845 than at present. Perhaps the following table may throw a fuller light on the matter. I give it from what I learned from several men, who were without accounts to refer to, but speaking positively from memory; I give the statement per week, as for a single man, without charge for the support of a wife and family, and without any help from other resources.

	Before Free Trade.	After Free Trade.	Saving since Free Trade.
Rent . . .	1*s.* 6*d.*	1*s.* 6*d.*	...
Bread (5 loaves)	2*s.* 11*d.*	2*s.* 6*d.*	5*d.*
Butter (½ lb.) .	5*d.*	5*d.*	...
Tea (2 oz.) . .	8*d.*	8*d.*	...
Sugar (½ lb.) .	3*d.*	2*d.*	1*d.*
Meat (3 lb.) .	1*s.* 6*d.*	1*s.* 3*d.*	3*d.*
Bacon (1 lb.) .	5*d.*	5*d.*	...
Fish (a dinner a day, 6 days)	3*d.*, or 1*s.* 6*d.* weekly.	2*d.*, or 1*s.* weekly.	6*d.*
Potatoes or Vegetables (½*d.* a day) . .	3½*d.*	3½*d.*	...
Beer (pot) . .	3½*d.*	3½*d.*	...
Total saving, per week, since Free Trade			1*s.* 3*d.*

In butter, bacon, potatoes, &c., and beer, I could hear of no changes, except that bacon might be a trifle cheaper, but instead of a good quality selling better, although cheaper, there was a demand for an inferior sort.

In the foregoing table the weekly consumption of several necessaries is given, but it is not to be understood that one man consumes them all in a week; they are what may generally be consumed when such things are in demand by the poor, one week after another, or one day after another, forming an aggregate of weeks.

Original from HARVARD UNIVERSITY

Thus, Free Trade and cheap provisions are an unquestionable benefit, if unaffected by drawbacks, to the labouring poor.

The above statement refers only to a fully employed hand.

The following table gives the change since Free Trade in the earnings of casual hands, and relates to the past and the present expenditure of a scavager. The man, who was formerly a house painter, said he could bring me 50 men similarly circumstanced to himself.

In 1845, per Week.	s.	d.	In 1851, per Week.	s.	d.
Rent	1	4	Rent	1	8
5 loaves	2	11	4 loaves	2	0
Butter	0	5	Butter	0	5
Tea	0	6	Tea	0	5
Meat (3 lbs.)	1	6	Meat (3 lbs.)	1	0
Potatoes	0	3	Potatoes	0	2
Beer (a pot)	0	4	Beer (a pint)	0	2
	7	3		5	10

Here, then, we find a positive saving in the expenditure of 1*s*. 5*d*. per week in this man's wages, since the cheapening of food.

His earnings, however, tell a different story.

	1845. s.	1845. d.	1851. s.	1851. d.
Earnings of 6 days	15	0		
Ditto 3 days			7	6
Weekly Income	15	0	7	6
Expenditure	7	3	5	10
Difference	7	9	1	8

Thus we perceive that the beneficial effects of cheapness are defeated by the dearth of employment among labourers.

It is impossible to come to *precise* statistics in this matter, but all concurrent evidence, as regards the unskilled work of which I now treat, shows that labour is attainable at almost any rate.

Another drawback to the benefits of cheap food I heard of first in my inquiries (for the Letters on Labour and the Poor, in the *Morning Chronicle*) among the boot and shoemakers—their rents had been raised in consequence of their landlords' property having been subjected to the income tax. Numbers of large houses are now let out in single rooms, in the streets off Tottenham-court-road, and near Golden-square, as well as in many other quarters—to men, who, working for West-end tradesmen, must live, for economy of time, near the shops from which they derive their work. Near and in Cunningham-street and other streets, two men, father and son, rent upwards of 30 houses, the whole of which they let out in one or two rooms, it is believed at a very great profit; in fact they live by it.

The rent of these houses, among many others, was raised when the income tax was imposed, the sub-letters declaring, with what truth no one knew, that the rents were raised to them. It is common enough for capitalists to fling such imposts on the shoulders of the poor, and I heard scavagers complain, that every time they had to change their rooms, they had either to pay more rent by 2*d*. or 3*d*. a week, or put up with a worse place. One man who lived at the time of the passing of the Income Tax Bill in Shoe-lane, found his rent raised suddenly 3*d*. a week, a non-resident landlord or agent calling for it weekly. He was told that the advance was to meet the income tax. "I know nothing about what income tax means," he said, "but it 's some —— roguery as is put on the poor." I heard complaints to the same purport from several working scavagers, and the lettors of rooms are the most exacting in places crowded with the poor, and where the poor think or feel they must reside "to be handy for work." What connection there may be between the questions of Free Trade and the necessity of the income tax, it is not my business now to dilate upon, but it is evident that the circumstances of the country are not sufficiently prosperous to enable parliament to repeal this "temporary" impost.

From a better informed class than the scavagers, I might have derived data on which to form a calculation from account books, &c., but I could hear of none being kept. I remember that a lady's shoemaker told me that the weekly rents of the ten rooms in the house in which he lived were 4*s*. 3*d*. higher than before the income tax, which "came to the same thing as an extra penny on over 50 loaves a week." It is certain that the great tax-payers of London are the labouring classes.

I have endeavoured to ascertain the facts in connection with this complex subject in as calm and just a manner as possible, leaning neither to the Protectionist nor the Free-Trade side of the question, and I must again in honesty acknowledge, that to the *constant* hands among the scavagers and dustmen of the metropolis, the repeal of the Corn Laws appears to have been an unquestionable benefit.

I shall conclude this exposition of the condition and earnings of the working scavagers employed by the more honourable masters, with an account of the average income and expenditure of the better-paid hands (regular and casual, as well as single and married), and first, of the unmarried regular hand.

The following is an estimate of the income and expenditure of an *unmarried* operative scavager *regularly* employed, working for a large contractor:—

WEEKLY INCOME.	£	s.	d.
Constant Wages.			
Nominal weekly wages	0	16	0
Perquisites	0	2	0
Actual weekly wages	0	18	0

WEEKLY EXPENDITURE.	£	s.	d.
Rent	0	2	0
Washing and mending	0	0	10
Clothes, and repairing ditto	0	0	10
Butcher's meat	0	3	6
Bacon	0	0	8
Vegetables	0	0	4
Cheese	0	0	4
Beer	0	3	0
Spirits	0	1	0
Tobacco	0	0	10½
Butter	0	0	7½
Sugar	0	0	4
Tea	0	0	3
Coffee	0	0	3
Fish	0	0	4
Soap	0	0	2
Shaving	0	0	1
Fruit	0	0	4
Keep of 2 dogs	0	0	6
Amusements, as skittles, &c.	0	1	9
	0	18	0

The subjoined represents the income of an *unmarried* operative scavager *casually* employed by a small master scavager six months during the year, at 15*s.* a week, and 20 weeks at sand and rubbish carting, at 12*s.* a week.

Casual Wages.	£	s.	d.
Nominal weekly wages at scavaging, 16*s.* for 26 weeks during the year	20	16	0
Perquisites, 2*s.* for 26 weeks during the year	2	12	0
Actual weekly wages for 26 weeks during the year	0	16	0
Nominal and actual weekly wages at rubbish carting, 12*s.* for 20 weeks more during the year	12	0	0
Average casual or constant weekly wages throughout the year	0	15	4½

The expenditure of this man when in work was nearly the same as that of the regular hand; the main exceptions being that his rent was 1*s.* instead of 2*s.*, and no dogs were kept. When in work he saved nothing, and when out of work lived as he could.

The *married* scavagers are differently circumstanced from the *unmarried;* their earnings are generally increased by those of their family.

The labour of the wives and children of the scavagers is not unfrequently in the capacity of sifters in the dust-yards, where the wives of the men employed by the contractors have the preference, and in other but somewhat rude capacities. One of their wives I heard of as a dresser of sheep's trotters; two as being among the most skilful dressers of tripe for a large shop; one as "a cat's-meat seller" (her father's calling); but I still speak of the regular scavagers—I could not meet with one woman "working a slop-needle." One, indeed, I saw who was described to me as a "feather dresser to an out-and-out negur," but the woman assured me she was neither badly paid nor badly off. Perhaps by such labour, as an average on the part of the wives, 9*d.* a day is cleared, and 1*s.* "on tripe and such like." Among the "casual's" wives there are frequent instances of the working for slop shirt-makers, &c., upon the coarser sorts of work, and at "starvation wages," but on such matters I have often dwelt. I heard from some of these men that it was looked upon as a great thing if the wife's labour could clear the week's rent of 1*s.* 6*d.* to 2*s.*

The following may be taken as an estimate of the income and outlay of a *better paid and fully* employed operative scavager, with his wife and two children:—

WEEKLY INCOME OF THE FAMILY.	£	s.	d.
Nominal weekly wages of man, 16*s.*			
Perquisites, 2*s.*			
Actual weekly wages of man	0	18	0
Nominal weekly wages of wife, 6*s.*			
Perquisites in coal and wood, 1*s.* 4*d.*			
Actual weekly wages of wife	0	7	4
Nominal weekly wages of boy	0	3	0
	1	8	4

WEEKLY EXPENDITURE OF THE FAMILY.	£	s.	d.
Rent	0	3	0
Candle	0	0	3½
Bread	0	2	1
Butter	0	0	10
Sugar	0	0	8
Tea	0	0	10
Coffee	0	0	4
Butcher's meat	0	3	6
Bacon	0	1	2
Potatoes	0	0	10
Raw fish	0	0	4
Herrings	0	0	4
Beer (at home)	0	2	0
,, (at work)	0	1	6
Spirits	0	1	0
Cheese	0	0	6
Flour	0	0	3
Suet	0	0	3
Fruit	0	0	3
Rice	0	0	0½

Of the Worse Paid Scavagers, or those working for Scurf* Employers.

There are in the scavagers' trade the same distinct classes of employers as appertain to all other trades; these consist of:—

1. The large capitalists.
2. The small capitalists.

As a rule (with some few honourable and dishonourable exceptions, it is true) I find that the large capitalists in the several trades are generally the employers who pay the higher wages, and the small men those who pay the lower. The reasons for this conduct are almost obvious. The power of the capital of the "large master" must be contended against by the small one; and the usual mode of contention in all trades is by reducing the wages of the working men. The wealthy master has, of course, many advantages over the poor one. (1) He can pay ready money, and obtain discounts for immediate payment. (2) He can buy in large quantities, and so get his stock cheaper. (3) He can purchase what he wants in the best markets, and that *directly* of the producer, without the intervention and profit of the middleman. (4) He can buy at the best times and seasons; and "lay in" what he requires for the purposes of his trade long before it is needed, provided he can obtain it "a bargain." (5) He can avail himself of the best tools and mechanical contrivances for increasing the productiveness or "economizing the labour" of his workmen. (6) He can build and arrange his places of work upon the most approved plan and in the best situations for the manufacture and distribution of the commodities. (7) He can employ the highest talent for the management or design of the work on which he is engaged. (8) He can institute a more effective system for the surveillance and checking of his workmen. (9) He can employ a large number of hands, and so reduce the secondary expenses (of firing, lighting, &c.) attendant upon the work, as well as the number of superintendents and others engaged to "look after" the operatives. (10) He can resort to extensive means of making his trade known. (11) He can sell cheaper (even if his cost of production be the same), from employing a larger capital, and being able to "do with" a less rate of profit. (12) He can afford to give credit, and so obtain customers that he might otherwise lose.

The small capitalist, therefore, enters the field of competition by no means equally matched against his more wealthy rival. What the little master wants in "substance," however, he generally endeavours to make up in cunning. If he cannot buy his materials as cheap as a trader of larger means, he uses an inferior or cheaper article, and seeks by some trick or other to palm it off as equal to the superior and dearer kind. If the tools and appliances of the trade are expensive, he either transfers the cost of providing them to the workmen, or else he charges them a rent for their use; and so with the places of work, he mulcts their wages of a certain sum per week for the gas by which they labour, or he makes them do their work at home, and thus saves the expense of a workshop; and, lastly, he pays his men either a less sum than usual for the same quantity of labour, or exacts a greater quantity from them for the same sum of money. By one or other of these means does the man of limited capital seek to counterbalance the advantages which his more wealthy rival obtains by the possession of extensive "resources." The large employer is enabled to work cheaper by the sheer force of his larger capital. He reduces the cost of production, not by employing a cheaper labour, but by "economizing the labour" that he does employ. The small employer, on the other hand, seeks to keep pace with his larger rival, and strives to work cheap, not by "the economy of labour" (for this is hardly possible in the small way of production), but by reducing the wages of his labourers. Hence the *rule* in almost every trade is that the smaller capitalists pay a lower rate of wages. To this, however, there are many honourable exceptions among the small masters, and many as dishonourable among the larger ones in different trades. Messrs. Moses, Nicoll, and Hyams, for instance, are men who certainly cannot plead deficiency of means as an excuse for reducing the ordinary rate of wages among the tailors.

Those employers who seek to reduce the prices of a trade are known technologically as "*cutting employers*," in contradistinction to the standard employers, or those who pay their workpeople and sell their goods at the ordinary rates.

Of "cutting employers" there are several kinds, differently designated, according to the different means by which they gain their ends. These are:—

* The Saxon *Sceorfa*, which is the original of the English Scurf, means a scab, and scab is the term given to the "cheap men" in the shoemaking trade. Scab is the root of our word *Shabby*; hence Scurf and Scab, deprived of their offensive associations, both mean shabby fellows.

1. "*Drivers*," or those who compel the men in their employ to do more work for the same wages; of this kind there are two distinct varieties:—

a. *The long-hour masters*, or those who make the men work longer than the usual hours of labour.

b. *The strapping masters*, or those who make the men (by extra supervision) "strap" to their work, so as to do a greater quantity of labour in the usual time.

2. *Grinders*, or those who compel the workmen (through their necessities) to do the same amount of work for less than the ordinary wages.

The reduction of wages thus brought about may or may not be attended with a corresponding reduction in the price of the goods to the public; if the price of the goods be reduced in proportion to the reduction of wages, the consumer, of course, is benefited at the expense of the producer. When it is not followed by a like diminution in the selling price of the article, and the wages of which the men are mulct go to increase the profits of the capitalist, the employer alone is benefited, and is then known as a "*grasper*."

Some cutting tradesmen, however, endeavour to undersell their more wealthy rivals, by reducing the ordinary rate of profit, and extending their business on the principle of small profits and quick returns, the "nimble ninepence" being considered "better than the slow shilling." Such traders, of course, cannot be said to reduce wages directly—indirectly, however, they have the same effect, for in reducing prices, other traders, ever ready to compete with them, but, unwilling, or perhaps unable, to accept less than the ordinary rate of profit, seek to attain the same cheapness by diminishing the cost of production, and for this end the labourers' wages are almost invariably reduced.

Such are the characteristics of the cheap employers in all trades. Let me now proceed to point out the peculiarities of what are called the scurf employers in the scavaging trade.

The insidious practices of capitalists in other callings, in reducing the hire of labour, are not unknown to the scavagers. The evils of which these workmen have to complain under scurf or slop masters are:—

1. *Driving*, or being compelled to do more work for the *same pay*.

2. *Grinding*, or being compelled to do the same or a greater amount of work for *less pay*.

1. Under the first head, if the employment be at all regular, I heard few complaints, for the men seemed to have learned to look upon it as an inevitable thing, that one way or other they *must* submit, by the receipt of a reduced wage, or the exercise of a greater toil, to a deterioration in their means.

The system of driving, or, in other words, the means by which extra work is got out of the men for the same remuneration, in the scavagers' trade is as follows:—some employers cause their scavagers after their day's work in the streets, to load the barges with the street and house-collected manure, without any additional payment; whereas, among the more liberal employers, there are bargemen who are employed to attend to this department of the trade, and if their street scavagers *are* so employed, which is not very often, it is computed as extra work or "over hours," and paid for accordingly. This same indirect mode of reducing wages (by getting more work done for the same pay) is seen in many piece-work callings. The slop boot and shoe makers pay the same price as they did six or seven years ago, but they have "knocked off the extras," as the additional allowance for greater than the ordinary height of heel, and the like. So the slop Mayor of Manchester, Sir Elkanah Armitage, within the last year or two, sought to obtain from his men a greater length of "cut" to each piece of woven for the same wages.

Some master scavagers or contractors, moreover, reduce wages by making their men do what is considered the work of "a man and a half" in a week, without the recompense due for the labour of the "half" man's work; in other words, they require the men to condense eight or nine days' labour into six, and to be paid for the six days only; this again is usual in the strapping shops of the carpenters' trade.

Thus the class of street-sweepers do not differ materially in the circumstances of their position from other bodies of workers skilled and unskilled.

Let me, however, give a practical illustration of the loss accruing to the working scavagers by the *driving* method of reducing wages.

A is a large contractor and a driver. He employs 16 men, and pays them the "regular wages" of the honourable trade; but, instead of limiting the hours of labour to 12, as is usual among the better class of employers, he compels each of his men to work at the least 16 hours per diem, which is one-third more, and for which the men should receive one-third more wages. Let us see, therefore, how much the men in his employ lose annually by these means.

	Sum received per Annum.	Sum they should receive.	Difference.
	£ s.	£ s.	£ s.
4 Gangers, at 18s. a week, for 9 months in the year........	140 8	210 12	70 4
12 Sweepers, at 16s. a week, for 9 months in the year........	374 8	499 4	124 16
Total wages per Ann.	514 16	709 16	195 0

Here, then, we find the annual loss to these men through the system of "driving" to be 195*l.* per annum.

But A is not the only driver in the scavagers' trade; out of the 19 masters having contracts for scavaging, as cited in the table given at pp. 213, 214, there are 4 who are regular drivers; and, making the same calculation as above, we have the following results:—

	Sum received per Annum.	Sum they should receive.	Difference.
	£ s.	£ s.	£ s.
26 Gangers, at 18s. a week, for 9 months in the year........	912 12	1216 16	304 4
80 Sweepers, at 16s. a week, for 9 months in the year........	2496 0	3328 0	832 0
	3308 12	4544 16	1136 4

Thus we find that the gross sum of which the men employed by these drivers are deprived, is no less than 1136*l.* per annum.

2. The second or indirect mode of reducing the wages of the men in the scavaging trade is by *Grinding;* that is to say, by making the men do the same amount of work for less pay. It requires nothing but a practical illustration to render the injury of this particular mode of reduction apparent to the public.

B is a master scavager (a small contractor, though the instances are not confined to this class), and a "*Grinder.*" He pays 1*s.* a week less than the "regular wages" of the honourable trade. He employs six men; hence the amount that the workmen in his pay are mulct of every year is as follows:—

	Sum received per Annum.	Sum they should receive.	Difference.
	£ s.	£ s.	£ s.
6 men, at 15s. a week, for 9 months in the year	175 10	187 4	11 14

Here the loss to the men is 11*l.* 14*s.* per annum, and there is but one such grinder among the 19 master scavagers who have contracts at present.

3. The third and last method of reducing the earnings of the men as above enumerated, is by a combination of both the systems before explained, viz., by *grinding* and *driving* united, that is to say, by not only paying the men a smaller wage than the more honourable masters, but by compelling them to work longer hours as well. Let me cite another illustration from the trade.

C is a large contractor, and both a grinder and driver. He employs 28 men, and not only pays them less wages, but makes them work longer hours than the better class of employers. The men in his pay, therefore, are annually mulct of the following sums.

SUMS THE MEN RECEIVE.	£ s. d.	SUMS THEY SHOULD RECEIVE.	£ s. d.
7 Gangers, at 16s. a week, for 9 months in the year..........	218 8 0	7 Gangers, at 18s. a week, for 9 months in the year..........	245 14 0
21 Sweepers, at 15s. a week....	614 5 0	Over work, 4 hours per day.	61 8 6
	832 13 0	21 Sweepers, at 16s. a week, 12 hours a day ..	635 4 0
		Over work, 4 hours a day ..	163 6 0
			1125 12 6

Here the annual loss to the men employed by this one master is 292*l.* 19*s.* 6*d.*

Among the 19 master scavagers there are altogether 7 employers who are both grinders and drivers. These employ among them no less than 111 hands; hence, the gross amount of which their workmen are yearly defrau—no, let me adhere to the principles of political economy, and say deprived—is as under:—

SUM THE MEN ANNUALLY RECEIVE.	£ s. d.	SUM THEY SHOULD ANNUALLY RECEIVE.	£ s. d.
28 Gangers, at 16s. a week, employed for 9 months in the year..........	873 12 0	28 Gangers, at 18s. a week (12 hours a day), for 9 months in the year	982 16 0
83 Sweepers, at 15s. a week, employed for 9 months in the year	2427 15 0	Over work, 4 hours per day	245 14 0
	3301 7 0	83 Sweepers, at 16s. a week, 12 hours a day	2589 12 0
		Over work, 4 hours per day	647 8 0
			4465 10 0

Here we perceive the gross loss to the operatives from the system of combined grinding and driving to be no less than 1164*l.* 3*s.* per annum.

Now let us see what is the aggregate loss to the working men from the several modes of reducing their wages as above detailed.

	£.	s.	d.
Loss to the working scavagers by the "driving" of employers.	1136	4	0
Ditto by the "grinding" .	11	14	0
Ditto by the "grinding *and* driving" of employers . .	1164	3	0
Total loss to the working scavagers per annum . . .	2312	1	0

Now this is a large sum of money to be wrested annually out of the workmen—that it is so wrested is demonstrated by the fact cited at p. 174 in connection with the dust trade.

The wages of the dustmen employed by the large contractors, it is there stated, have been increased within the last seven years from 6*d.* to 8*d.* per load. This increase in the rate of remuneration was owing to complaints made by the men to the Commissioners of Sewers, that they were not able to live on their earnings; an inquiry took place, and the result was that the Commissioners decided upon letting the contracts only to such parties as would undertake to pay a fair price to their workmen. The contractors accordingly increased the remuneration of the labourers as mentioned.

Now political economy would tell us that the Commissioners *interfered* with wages in a most reprehensible manner—preventing the natural operation of the law of Supply and Demand; but both justice and benevolence assure us that the Commissioners did perfectly right. The masters in the dust trade were forced to make good to the men what they had previously taken from them, and the same should be done in the scavaging trade—the contracts should be let only to those

Original from HARVARD UNIVERSITY

masters who will undertake to pay the regular rate of wages, and employ their men only the regular hours; for by such means, and by such means alone, can *justice* be done to the operatives.

This brings me to the *cause of the reduction of wages in the scavaging trade*. The scurf trade, I am informed, has been carried on among the master scavagers upwards of 20 years, and arose partly from the contractors having *to pay* the parishes for the house-dust and street-sweepings, brieze and street manure at that period often selling for 30s. the chaldron or load. The demand for this kind of manure 20 years ago was so great, that there was a competition carried on among the contractors themselves, each out-bidding the other, so as to obtain the right of collecting it; and in order not to lose anything by the large sums which they were induced to bid for the contracts, the employers began gradually to "grind down" their men from 17s. 6d. (the sum paid 20 years back) to 17s. a week, and eventually to 15s., and even 12s. weekly. This is a curious and instructive fact, as showing that even an increase of prices will, *under the contract system*, induce a reduction of wages. The greed of traders becomes, it appears, from the very height of the prices, proportionally intensified, and from the desire of each to reap the benefit, they are led to outbid one another to such an extent, and to offer such large premiums for the right of appropriation, as to necessitate a reduction of every possible expense in order to make any profit at all upon the transaction. Owing, moreover, to the surplus labour in the trade, the contractors were enabled to offer any premiums and reduce wages as they pleased; for the casually-employed men, when the wet season was over, and their services no longer required, were continually calling upon the contractors, and offering their services at 2s. and 3s. less per week than the regular hands were receiving. The consequence was, that five or six of the master scavagers began to reduce the wages of their labourers, and since that time the number has been gradually increasing, until now there are no less than 21 scurf masters (8 of whom have no contracts) out of the 34 contractors; so that nearly three-fifths of the entire trade belong to the *grinding* class. Within the last seven or eight years, however, there has been an increase of wages in connection with the city operative scavagers. This was owing mainly to the operatives complaining to the Commissioners that they could not live upon the wages they were then receiving—12s. and 14s. a week. The circumstances inducing the change, I am informed, were as follows:—one of the gangers asked a tradesman in the city to give the street-sweepers "something for beer," whereupon the tradesman inquired if the men could not find beer out of their wages, and on being assured that they were receiving only 12s. a week, he had the matter brought before the Board. The result was, that the wages of the operatives were increased from 12s. to 15s. and 16s. weekly, since which time there has been neither an increase nor a decrease in their pay. The cheapness of provisions seems to have caused no reduction with them.

Now there are but two "efficient causes" to account for the reduction of wages among the scurf employers in the scavagers' trade:—(1) The employers may diminish the pay of their men from a disposition to "*grind*" out of them an inordinate rate of profit. (2) The price paid for the work may be so reduced that, consistent with the ordinary rate of profit on capital, and remuneration for superintendence, greater wages cannot be paid. If the first be the fact, then the employers are to blame, and the parishes should follow the example of the Commissioners of Sewers, and let the work to those contractors only who will undertake to pay the "regular wages" of the honourable trade; but if the latter be the case, as I strongly suspect it is, though some of the masters seem to be more "grasping" than the rest—but in the paucity of returns on this matter, it is difficult to state positively whether the price paid for the labour of the working scavager is in all the parishes proportional to the price paid to the employers for the work (a most important fact to be solved)—if, however, I repeat, the decrease of the wages be mainly due to the decrease in the sums given for the performance of the contract, then the parishes are to blame for seeking to get their work done *at the expense of the working men*.

The contract system of work, I find, necessarily tends to this diminution of the men's earnings in a trade. Offer a certain quantity of work to the lowest bidder, and the competition will assuredly be maintained at *the operative's expense*. It is idle to expect that, as a general rule, traders will take less than the ordinary rate of profit. Hence, he who underbids will usually be found to underpay. This, indeed, is almost a necessity of the system, and one which the parochial functionaries more than all others should be guarded against—seeing that a decrease of the operative's wages can but be attended with an increase of the very paupers, and consequently of the parochial expenses, which they are striving to reduce.

A labourer, in order to be self-supporting and avoid becoming a "burden" on the parish, requires something more than bare subsistence-money in remuneration for his labour, and yet this is generally the mode by which we test the *sufficiency of wages*. "A man can live very comfortably upon that!" is the exclamation of those who have seldom thought upon what constitutes the *minimum* of self-support in this country. A man's wages, to prevent pauperism, should include, besides present subsistence, what Dr. Chalmers has called "his secondaries;" viz., a sufficiency to pay for his maintenance: 1st, during the slack season; 2nd, when out of employment; 3rd, when ill; 4th, when old*. If insufficient to do

* These items wages *must* include to prevent pauperism, *even with providence*. But this is only on the supposition that the labourer is unmarried; if married, however, and having a family, then his wages should include, moreover, the keep of at least three extra persons, as well as the education of the children. If not, one of two results is self-evident—either the wife must toil, to the neglect of her young ones, and they be allowed to run about and pick their morals and education, as I have before said, out of the gutter, or else the whole family must be transferred to the care of the parish.

this, it is evident that the man at such times must seek parochial relief; and it is by the reduction of wages down to bare subsistence, that the cheap employers of the present day shift the burden of supporting their labourers when unemployed on to the parish; thus virtually perpetuating the allowance system or relief in aid of wages under the old Poor Law. Formerly the mode of hiring labourers was by the year, so that the employer was bound to maintain the men when unemployed. But now journey-work, or hiring by the day, prevails, and the labourers being paid—and that mere subsistence-money—only when wanted are necessitated to become either paupers or thieves when their services are no longer required. It is, moreover, this change from yearly to daily hirings, and the consequent discarding of men when no longer required, that has partly caused the immense mass of surplus labourers, who are continually vagabondizing through the country begging or stealing as they go—men for whom there is but some two or three weeks' work (harvesting, hop-picking, and the like) throughout the year.

That there is, however, a large system of *jobbing pursued by the contractors* for the house-dust and cleansing of the streets, there cannot be the least doubt. The minute I have cited at page 210 gives us a slight insight into the system of combination existing among the employers, and the extraordinary fluctuations in the prices obtained by the contractors would lead to the notion that the business was more a system of gambling than trade. The following returns have been procured by Mr. Cochrane within the last few days:—

"Average yearly cost of cleansing the whole of the public ways within the City of London, including the removal of dust, ashes, &c., from the houses of the inhabitants, for eight years, terminating at Michaelmas in the year 1850 . . . . . £4,643

Square yards of carriage-way, estimated at 430,000

Square yards of footway, estimated at 300,000

A more specific and later return is as follows:—

	Received for Dust. £	s.	d.	Paid for cleansing, &c. £	s.	d.	
1845	0	0	0	2833	2	0	Streets not cleansed daily.
1846	1354	5	0	6034	6	0	Streets cleansed daily.
1847	4455	5	0	8014	2	0	
1848	1328	15	0	7226	1	6	
1849	0	0	0	7486	11	6	
1850	0	0	0	6779	16	0	

"From the above return," says Mr. Cochrane, "it may be *inferred* that the annual sums paid for cleansing in each year of 1844 and 1843 did not exceed 2281*l.*, as this would make up the eight years' average calculation of 4643*l.*"

Since the streets have been cleansed daily, it will be seen that the average has been 7188*l.* The smallest amount, in 1846, was 6034*l.*; and the largest, in 1847, 8014*l.*; which was a sudden increase of 1980*l.*

Here, then, we perceive an immediate increase in the price paid for scavaging between 1846 and 1847 of nearly 33 per cent., and since the wages of the workmen were not proportionately increased in the latter year by the employers, it follows that the profits of the contractors must have been augmented to that enormous extent. The only effectual mode of preventing this system of jobbing being persevered in, *at the expense of the workmen*, is by the insertion of a clause in each parish contract similar to that introduced by the Commissioners of Sewers—that at least a fair living rate of wages shall be paid by each contractor to the men employed by him. This may be an interference with the freedom of labour, according to the economists' "cant" language, but at least it is a restriction of the tyranny of capital, for free labour means, when literally translated, *the unrestricted use of capital*, which is (especially when the moral standard of trade is not of the highest character) perhaps the greatest evil with which a State can be afflicted.

Let me now speak of the *Scurf labourers*. The moral and social characteristics of the working scavagers who labour for a lower rate of hire do not materially differ from those of the better paid and more regularly employed body, unless, perhaps, in this respect, that there are among them a greater proportion of the "casuals," or of men reared to the pursuit of other callings, and driven by want, misfortune, or misconduct, to "sweep the streets;" and not only that, but to regard the "leave to toil" in such a capacity a boon. These constitute, as it were, the cheap labourers of this trade.

Among the parties concerned in the lower-priced scavaging, are the usual criminations. The parish authorities will not put up any longer with the extortions of the contractors. The contractors cannot put up any longer with the stinginess of the parishes. The *working* scavagers, upon whose shoulders the burthen falls the heaviest—as it does in all depreciated tradings—grumble at both. I cannot aver, however, that I found among the men that bitter hatred of their masters which I found actuating the mass of operative tailors, shoemakers, dressmakers, &c., toward the slop capitalists who employed them.

I have pointed out in what the "scurf" treatment of the labourers was chiefly manifested—in extra work for inferior pay; in doing eight or nine days' work in six; and in being paid for only six days' labour, and not always at the ordinary rate even for the lighter toil—not 2*s.* 8*d.*, but 2*s.* 6*d.* or even 2*s.* 4*d.* a day. To the wealthy, this 2*d.* or 4*d.* a day may seem but a trifling matter, but I heard a working scavager (formerly a house-painter) put it in a strong light: "that 3*d.* or 4*d.* a day, sir, is a poor family's rent." The rent, I may observe, as a result of my inquiries among the more decent classes of labourers, is often the primary consideration: "You see, sir, we must have a roof over our heads."

A scavager, working for a scurf master, gave

me the following account. He was a middle-aged man, decently dressed, for when I saw him, he was in his "Sunday clothes," and was quiet in his tones, even when he spoke bitterly.

"My father," he said, "was once in business as a butcher, but he failed, and was afterwards a journeyman butcher, but very much respected, I know, and I used to job and help him. O dear, yes! I can read and write, but I have very seldom to write, only I think one never forgets it, it's like learning to swim, that way; and I read sometimes at coffee-shops. My father died rather sudden, and me and a brother had to look out. My brother was older than me, he was 20 or 21 then, and he went for a soldier, I believe to some of the Ingees, but I've never heard of him since. I got a place in a knacker's yard, but I didn't like it at all, *it was so confining*, and should have hooked it, only I left it honourable. I can't call to mind how long that's back, perhaps 16 or 18 years, but I know there was some stir at the time about having the streets and yards cleaner. A man called and had some talk with the governor, and says he, says the governor, says he, 'if you want a handy lad with his besom, and he's good for nothing else'—but that was his gammon—'here's your man;' so I was engaged as a young sweeper at 10*s.* a week. I worked in Hackney, but I heard so much about railways, that I saved my money up to 10*s.*, and popped [pledged] a suit of mourning I'd got after my father's death for 22*s.*, and got to York, both on foot and with lifts. I soon got work on a rail; there was great call for rails then, but I don't know how long it's since, and I was a navvy for six or seven years, or better. Then I came back to London. I don't know just what made me come back, *but I was restless*, and I thought I could get work as easy in London as in the country, but I couldn't. I brought 21 gold sovereigns with me to London, twisted in my fob for safeness, in a wash-leather bag. They didn't last so long as they ought to. I didn't care for drinking, only when I was in company, but I was a little too gay. One night I spent over 12*s.* in the St. Helena Gardens at Rotherhithe, and that sort of thing soon makes money show taper. I got some work with a rubbish carter, a regular scurf. I made only about 8*s.* a week under him, for he didn't want me this half day or that whole day, and if I said anything, he told me I might go and be d—d, he could get plenty such, and I knew he could. I got on then with a gangsman I knew, at street-sweeping. I had 15*s.* a week, but not regular work, but when the work wer'n't regular, I had 2*s.* 8*d.* a day. I then worked under another master for 14*s.* a week, and was often abused that I wasn't better dressed, for though that there master paid low wages, he was vexed if his men didn't look decent in the streets. I've heard that he said he paid the best of wages when asked about it. I had another job after that, at 15*s.*, and then 16*s.* a week, with a contractor as had a wharf; but a black nigger slave was never slaved as I was. I've worked all night, when it's been very moonlight, in loading a barge, and I've worked until three and four in the morning that way, and then me and another man slept an hour or two in a shed as joined his stables, and then must go at it again. Some of these masters is ignorant, and treats men like dirt, but this one was always civil, and made his people be civil. But, Lord, I hadn't a rag left to my back. Everything was worn to bits in such hard work, and then I got the sack. I was on for Mr. —— next. He's a jolly good 'un. I was only on for him temp'ry, but I was told it was for temp'ry when I went, so I can't complain. I'm out of work this week, but I've had some jobs from a butcher, and I'm going to work again on Monday. I don't know at what wages. The gangsmen said they'd see what I could do. It'll be 15*s.*, I expect, and over-work if it's 16*s.*

"Yes, I like a pint of beer now and then, and one requires it, but I don't get drunk. I dusted for a fortnight once while a man was ill, and got more beer and twopences give me than I do in a year now; aye, twice as much. My mate and me was always very civil, and people has said, 'there's a good fellow, just sweep together this bit of rubbish in the yard here, and off with it.' That was beyond our duty, but we did it. I have very little night-work, only for one master; he's a sweep as well. I get 2*s.* 6*d.* a job for it. Yes, there's mostly something to drink, but you can't demand nothing. Night-work's nothing, sir; no more ain't a knacker's yard.

"I pay 2*s.* a week rent, but I'm washed for and found soap as well. My landlady takes in washing, and when her husband, for they're an old couple, has the rheumatics, I make a trifle by carrying out the clothes on a barrow, and Mrs. Smith goes with them and sees to the delivery. I've my own furniture.

"Well, I don't know what I spend in my living in a week. I have a bit of meat, or a saveloy or two, or a slice of bacon every day, mostly when I'm at work. I sometimes make my own meals ready in my room. No, I keep no accounts. There'd be very little use or pleasure in doing it when one has so little to count. When I'm past work, I suppose I must go to the workhouse. I sometimes wish I'd gone for a soldier when I was young enough. I shouldn't have minded going abroad. I'd have liked it better than not, for *I like to be about; yes, I like a change.*

"I go to chapel every Sunday night, and have regularly since Mr. —— (the butcher) gave me this cast-off suit. I promised him I would when I got the togs.

"Things would be well enough with me if I'd constant work and fair pay. I don't know what makes wages so low. I suppose it's rich people trying to get all the money they can, and caring nothing for poor men's rights, and poor men's sometimes forced to undersell one another, 'cause half a loaf you know, sir, is better than no bread at all" (a proverb, by the way, which has wrought no little mischief).

In conclusion, I may remark, that although I was told, in the first instance, there was sub-letting in street sweeping, I could not hear of any facts to

prove it. I was told, indeed, by a gentleman who took great interest in parochial matters, with a view to "reforms" in them, that such a thing was most improbable, for if a contractor sub-let any of his work it would soon become known, and as it would be evident that the work could be accomplished at a lower rate, the contractor would be in a worse position for his next contract.

OF THE STREET-SWEEPING MACHINE, AND THE STREET-SWEEPERS EMPLOYED WITH IT.

UNTIL the introduction of the machines now seen in London, I believe that no mechanical contrivances for sweeping the streets had been attempted, all such work being executed by manual labour, and employing throughout the United Kingdom a great number of the poor. The street-sweeping machine, therefore, assumes an importance as another instance of the displacement, or attempted displacement, of the labour of man by the mechanism of an engine.

The street-sweeping machines were introduced into London about five years ago, after having been previously used, under the management of a company in Manchester, the inventor and maker being Mr. Whitworth, of that place. The novelty and ingenuity of the apparatus soon attracted public attention, and for the first week or two the vehicular street-sweeper was accompanied in its progress by a crowd of admiring and inquisitive pedestrians, so easily attracted together in the metropolis. In the first instance the machines were driven through the streets merely to display their mode and power of work, and the drivers and attendants not unfrequently came into contact with the regular scavagers, when a brisk interchange of street wit took place, the populace often enough encouraging both sides. At present the street-sweeping machine proceeds on its line of operation as little noticed, except by visitors, and foreigners especially, as any other vehicle. The body of the sweeping machine, although the sizes may not all be uniform, is about 5 feet in length, and 2 feet 8 inches or 3 feet in width; the height is about 5 feet 6 inches or 6 feet, and the form that of a covered cart, with a rounded top. The sides of the exterior are of cast iron, the top being of wood. At the hinder part of the cart is fixed the sweeping-machine itself, covered by sloping boards which descend from the top of the cart, projecting slightly behind the vehicle to the ground; under the sloping boards is an endless chain of brushes as wide as the cart, 16 in number, placed at equal distances, and so arranged, that when made to revolve, each brush in turn passes over the ground, sweeping the mud along with it to the bottom sloping board, and so carrying it up to the interior of the cart. The chain of brushes is set in motion, over the surface of the pavement, by the agency of three cog wheels of cast iron; these are worked by the rotation of the wheels of the cart, the cogs acting upon the spindles to which the brooms are attached. The spindles, brushes, and the sloped boards can be raised or lowered by the winding of an instrument called the broom winder; or the whole can be locked. The brooms are raised when any acclivity is to be swept, and lowered at a declivity. The vehicle must be water-tight in order to contain the slop.

When full the machine holds about half a cart load or half a ton of dirt; this is emptied by letting down the back in the manner of a trap door. If the contents be solid, they have to be forked out; if more sloppy, they are "shot" out, as from a cart, the interior generally being roughly scraped to complete the emptying.

The districts which have as yet been cleansed by the machines are what may be considered a government domain, being the public thoroughfares under the control of the Commissioners of the Woods and Forests, running from Westminster Abbey to the Regent-circus in Piccadilly, and including Spring-gardens, Carlton-gardens, and a portion of the West Strand, where they were first employed in London; they have been used also in parts of the City; and are at present employed by the parish of St. Martin-in-the-Fields. The company by whom the mechanical street-sweeping business is carried on employ 12 machines, 4 water carts, 19 horses, and 24 men. They have also the use, but not the sole use, of two wharfs and barges at Whitefriars and Millbank. The machines altogether collect about 30 cart-loads of street-dirt a day, which is equivalent to four or five barge-loads in a week, if all were boated. Two barges per week are usually sent to Rochester, the others up the river to Fulham, &c. The average price is *5l.* 10*s.* to *6l.* per barge load, but when the freight has been chiefly dung, as much as *8l.* has been paid for it by a farmer.

The street-sweeping machine seems to have commanded the approbation of the General Board of Health, although the Board's expression of approval is not without qualification. "Even that efficient and economical implement," says one of the Reports, "the street-sweeping machine, leaves much filth between the interstices of the stones and some on the surface." One might have imagined, however, that an efficient and economical implement would not have left this "much filth" in its course; but the Board, I presume, spoke comparatively.

The reason of the circumscribed adoption of the machine—I say it with some reluctance, but from concurrent testimony—appears to be that it does *not* sweep sufficiently clean. It sweeps the surface, but only the surface; not cleansing what the scavagers call the "nicks" and "holes," and the Board of Health the "interstices," in the pavement.

One man is obliged to go along with each machine, to sweep the ridge of dirt invariably left at the edge of the track of the vehicle into the line of the next machine, so that it may be "licked up." In fine weather this work is often light enough. It is also the occupation of the accompanying scavager to sweep the dirt from the sloping edges of the public ways into the direct course of the machine, for the brushes are of no service along such slopes; he must also sweep out the contents of any hole or hollow there may be in the streets, as is frequently the case when the pavement has been disturbed in the

relaying or repairing of the gas or water pipes. But for this arrangement, I was told, the brushes would pass "clean over" such places, or only disturb without clearing away the dirt. Indeed irregularities of any kind in the pavement are great obstructions to the efficiency of the street-sweeping machine.

There are some places, moreover, wholly unsweepable by the machine; in many parts of St. Martin's parish, for instance, there are localities where the machine cannot be introduced; such are—St. Martin's-court; the flagged ways about the National Gallery; and the approach, alongside the church, to the Lowther Arcade; the pavement surrounding the fountains which adorn the "noblest site in Europe;" and a variety of alleys, passages, yards, and minor streets, which must be cleansed by manual labour.

In fair weather, again, water carts are indispensable before machine sweeping, for if the ground be merely dry and dusty, the set of brooms will not "bite."

We now come to estimate the *relative values of the mechanical and manual labour applied to the scavaging of the streets.* The average progress of the street-sweeping machine, in the execution of the scavagers' work, is about two miles an hour. It must not be supposed, however, that two streets each a mile in length, could be swept in one hour; for to do this the vehicle would have to travel up and down those streets as many times as the streets are wider than the machine. The machines, sometimes two, sometimes three or four, follow alongside each other's tracks in sweeping a street, so as to leave no part unswept. Thus, supposing a street half a mile long and nine yards wide, and that each machine swept a breadth of a yard, then three such machines, driven once up, and once again down, and once more up such a street, would cleanse it in three quarters of an hour. To do this by manual labour in the same or nearly the same time, would require the exertions of five men. Each machine has been computed to have mechanical power equal to the industry of five street-sweepers; and such, from the above computation, would appear to be the fact. I do not include the drivers in this enumeration, as of course the horse in the scavagers' cart, and in the machine require alike the care of a man and there is to each vehicle (whether mechanical or not) one hand (besides the carman) to sweep after the ordinary work. Hence every two men with the machine do the work of seven men by hand.

Having, then, ascertained the relative values of the two forces employed in cleansing the streets, let me now proceed to set forth what is "the economy of labour" resulting from the use of the sweeping machine. In the following table are given the number of men at present engaged by the machine company in the cleansing of those districts where the machine is in operation, as well as the annual amount of wages paid to the machine labourers; these facts are then collocated with the number of manual labourers that would be required to do the same work under the ordinary contract system (assuming every two labourers with the machine to do the work of seven labourers by hand), as well as the amount of wages that would be paid to such manual labourers; and finally, the number of men and amount of wages under the one system of street-cleansing is subtracted from the other, in order to arrive at the number of street-sweepers at present displaced by machine labour, and the annual loss in wages to the men so displaced; or, to speak economically, the last column represents the amount by which the Wage Fund of the street-sweepers is diminished by the employment of the machine.

TABLE SHOWING THE DIFFERENCE BETWEEN THE NUMBER OF MEN AT PRESENT ENGAGED IN STREET-SWEEPING BY MACHINES, AND THE NUMBER THAT WOULD BE REQUIRED TO SWEEP THE SAME DISTRICTS BY HAND, TOGETHER WITH THE ANNUAL AMOUNT OF WAGES ACCRUING TO EACH.

Hence, we perceive that no less than 60 street-sweepers are deprived of work by the street-sweeping machine, and that the gross Wage Fund of the men is diminished by the employment of mechanical labour no less than 2277*l.* per annum.

But let us suppose the street-sweeping machine to come into general use, and all the men who are at present employed by the contractors, both large and small, to sweep the street by hand to be superseded by it, what would be the result? how much money would the manual labourers be deprived of per annum, and how many self-supporting labourers would be pauperized thereby? The following table will show us: in the first compartment given below we have the number of manual labourers employed throughout London by the large and small contractors, and the amount of wages annually received by them*; in the second compartment is given the number of men that would be required to sweep the same districts by the machine, and the amount of wages that would be received by them at the present rate; and the third and last compartment shows the gross number of hands that would be displaced, and the annual loss that would accrue to the operatives by the substitution of mechanical for manual labour in the sweeping of the streets.

TABLE SHOWING THE DIFFERENCE BETWEEN THE NUMBER OF CONTRACTORS' MEN AT PRESENT EMPLOYED TO SWEEP THE STREETS BY HAND, AND THE NUMBER THAT WOULD BE REQUIRED TO SWEEP THE SAME DISTRICTS BY MACHINE WORK, TOGETHER WITH THE AMOUNT OF WAGES ACCRUING TO EACH.

	Manual Labour.		Machine Labour.		Difference.	
	Number of Men at present employed by Contractors to sweep the streets.	Annual Wages received by Contractors' Men for sweeping the Streets, at 15s. a Week.	Number of Machine Men that would be required to attend the Street-sweeping Machines.	Annual Wages that would be received by Machine Men, at 16s. a Week.	Number of Men that would be displaced by Machine-work.	Annual Loss that would accrue to Manual Labourers by Machine-work.
		£ s.		£ s.		£ s.
Districts at present swept by large contractors (see table, p. 214)	262	10,218 0	75	3120 0	187	7098 0

Total	275	10,725 0	79	3286 8	196	7438 12

Here we find that nearly 200 men would be pauperized, losing upwards of 7000*l.* per annum, if the street-sweeping machine came into general use throughout London. But, before the introduction of machines, the thoroughfares of St. Martin's parish were swept only once a week in dry weather, and three times a week in sloppy weather, and since the introduction of the machines they have been swept daily; allowing, therefore, the extra cleansing to have arisen from the extra cheapness of the machine work—though it seems to have been the result of improved sanatory regulations, for in parts where the machine has not been used the same alteration has taken place—making such allowance, however, it may, perhaps, be fair to say, that the same increase of cleansing would take place throughout London; that is to say, that the streets would be swept by the machines, were they generally used, twice as often as they are at present by hand. At this rate 158 machine men, instead of 79 as above calculated, would be required for the work; so that, reckoning for the increased employment which might arise from the increased cheapness of the work, we see that, were the street-sweeping machines used throughout the metropolis, nearly 120 of the 275 manual labourers now employed at scavaging by the large and small contractors, would be thrown out of work, and deprived of no less a sum than 4680*l.* per annum.

This amount, of course, the parishes would pocket, minus the sum that it would cost them to keep the displaced scavagers as paupers, so that in this instance, at least, we perceive that, however great a benefit cheapness may be to the wealthy classes, to the poorer classes it is far from being of the same advantageous character; for, just as much as the rate-payers are the gainers in the matter of street-cleansing must the labourers be the losers—the economy of labour in a trade where there are too many labourers already, and where the quantity of work does not admit of indefinite increase, meaning simply the increase of pauperism†.

* I have estimated the whole at 15*s.* a week the year through, gangers, "honourable men," regular hands and all, so as to allow for the diminished receipts of the casual hands.

† The usual argument in favour of machinery, viz., that "by reducing prices it extends the market, and so, causing a greater demand for the commodities, induces a greater quantity of employment," would also be an argument in favour of over population, since this, by

The "*labour question*" as connected with the sweeping-machine work, requires but a brief detail, as it presents no new features. The majority of the machine men may be described as having been "general (unskilled) labourers" before they embarked in their present pursuits: labourers for builders, brick-makers, rubbish-carters, the docks, &c.

Among them there is but one who was brought up as a mechanic; the others have all been labourers, brick-makers, and what I heard called "barrow-workers" on railways, the latter being the most numerous.

Employment is obtained by application at the wharfs. There is nothing of the character of a trade society among the machine-men; nothing in the way of benefit or sick clubs, unless the men choose to enrol themselves in a general benefit society, of which I did not hear one instance.

The payment is by the week, and without drawback in the guise or disguise of fines, or similar inflictions for the use of tools, &c.; the payment, moreover, is always in money.

The only perquisite is in the case of anything being found in the streets; but the rule as to perquisites seems to be altogether an understanding among the men. The disposal of what may be picked up in the streets appears, moreover, to be very much in the discretion of the picker up. If anything be found in the contents of the vehicle, when emptied, it is the perquisite of the driver, who is also the unloader; he, however, is expected to treat the men "on the same beat" out of any such "treasure trove," when the said treasure is considerable enough to justify such bounty. Odd sixpences, shillings, or copper coin, I was informed, were found almost every week, but I could ascertain no general average. One man, some time ago, found a purse inside the vehicle containing 20*s*., and "spent it out and out all on hisself," in a carouse of three days. He lost his situation in consequence.

The number of men employed by the company in this trade is 24, and these perform all the work required in the driving and attendance upon the machines in the street, in loading the barges, grooming the horses, &c. There is, indeed, a twenty-fifth man, but he is a blacksmith, and his wages of 35*s*. weekly are included in the estimate as to wear and tear given below, for he shoes the horses and repairs the machines.

The rate of wages paid by the machine company is 16*s*. a week, so that the full amount of wages is paid to the men.

But though the company cannot be ranked among the grinders of the scavaging trade, they *must* be placed among "the drivers."

cheapening, labour must have the same effect as machinery on prices, and, consequently (according to the above logic), induce a greater quantity of employment! But granting that machinery really does benefit the labourer in cases *where the market, and therefore the quantity of work, is largely extensible*, surely it cannot but be an injury in those callings where *the quantity of work is fixed*. Such is the fact with the sawing of wood, the reaping of corn, the threshing of corn, the sweeping of the streets, &c., and hence the evil of mechanical labour applied to such trades.

I am assured, by those who are familiar with such labour, that the 24 men employed by the machine masters do the work of upwards of 30 in the honourable trade, with a corresponding saving to their employers, from an adherence to the main point of the scurf system, the overworking of the men without extra payment.

It has been before stated that, in dry weather, the roads require to be watered before being swept, so that the brushes may *bite*. In summer the machine-men sometimes commence this part of their business at three in the morning; and at the other periods of the year, sometimes at early morning, when moonlight. In summer the hours of labour in the streets are from three, four, five, or six in the morning, to half-past four in the afternoon; in winter, from light to light, and after street there may be yard and barge work.

The saving by this scurf system, then, is:—

30 men (honourable trade), 16*s*. weekly	£1248	yearly.
24 men (scurf-trade) doing same work), 16*s*. weekly . .	998	„
Saving to capitalist and loss to labourer	£250	„

It now but remains to sum up the capital, income, and expenditure of the machine-scavaging trade.

The cost of a street-sweeping machine is 50*l*. to 60*l*., with an additional 5*l*. 5*s*. for the set of brooms. The wear and tear of these machines are very considerable. A man who had the care of one told me that when there was a heavy stress on it he had known the iron cogs of the inner wheels "go rattle, rattle, snap, snap," until it became difficult to proceed with the work. The brooms, too, in hard work and "cloggy" weather, are apt to snap short, and in the regular course of wear have to be renewed every four or five weeks. The sets of brooms are of bass, worked strongly with copper wire. The whole apparatus can be unscrewed and taken to pieces, to be cleaned or repaired. The repairs, independently of the renewal of the brooms, have been calculated at 7*l*. yearly each machine. The capital invested, then, in twelve street-sweeping machines, in the horses, and what may be considered the appurtenances of the trade, together with the yearly expenditure, may be thus calculated:—

Capital of Street-Sweeping Machine Trade.

12 machines, 60*l*. each	£720
12 sets of brooms, 5*l*. 5*s*. each set .	63
19 horses, 25*l*. each	475
4 water-carts, 20*l*. each	80
19 sets of harness (new), 7*l*. each set	133
4 barges, 50*l*. each	200
	£1671

YEARLY EXPENDITURE.

24 men, 16s. weekly	£998
120 sets of brooms for 12 machines, 4l. per set	480
Wear and tear, &c. (15 per cent.) .	255
Keep of 19 horses, 10s. each weekly	494
Rent (say)	150
Clerk (say)	100
Interest on capital, at 10 per cent. .	170
	£2674

In this calculation I have included wear and tear of the whole of the implements of the stock-in-trade, &c., taking that of the brooms on the most moderate estimate. According to the scale of payment by the parish of St. Martin (which is now 1000l. per annum) the probable receipts of a single year will be :—

YEARLY RECEIPTS.

	£	s.	d.
For hire of 12 machines . .	2500	0	0
200 barge-loads of manure, 5l. 15s. per barge	1150	10	0
	3650	10	0
Yearly expenditure .	2674	0	0
Profit	976	10	0

OF THE CLEANSING OF THE STREETS BY PAUPER LABOUR.

UNDER the head of the several modes and characteristics of street-cleansing, I stated at p. 207 of the present volume that there were no less than four distinct kinds of labourers employed in the scavaging of the public thoroughfares of the metropolis. These were :—

1. The self-supporting manual labourers.
2. The self-supporting machine labourers.
3. The pauper labourers.
4. The "philanthropic" labourers.

I have already set forth the distinguishing features of the first two of these different orders of workmen in connection with the scavaging trade, and now proceed in due order to treat of the characteristics of the third.

The subject of pauper labour generally is one of the most difficult topics that the social philosopher can deal with. It is not possible, however, to do more here than draw attention to the salient points of the question. The more comprehensive consideration of the matter must be reserved till such time as I come to treat of the poor specially under the head of those that cannot work.

By the 43 Eliz., which is generally regarded as the basis of the existing poor laws in this country, it was ordained that in every parish a fund should be raised by local taxation, not merely for the relief of the aged and infirm, but *for setting to work all persons having no means to maintain themselves, and using no ordinary or daily trade of life to get their living by.*

It was, however, soon discovered that it was one thing to pass an act for setting able-bodied paupers to work, and another thing to do so. "In every place," as Mr. Thornton truly says in his excellent treatise on "Over Population," "there is only a certain amount of work to be done," (limited by the extent of the market) "and only a certain amount of capital to pay for it; and, if the number of workmen be more than proportionate to the work, employment can only be given to those who want it by taking from those who have."

Let me illustrate this by the circumstances of the scavaging trade. There are 1760 miles of streets throughout London, and these would seem to require about 600 scavagers to cleanse them. It is self-evident, therefore, that if 400 paupers be "set" to sweep particular districts, the same number of self-supporting labourers must be deprived of employment, and if these cannot obtain work elsewhere, they of course must become paupers too, and, seeking relief, be put upon the same kind of work as they were originally deprived of, and that only to displace and pauperize in their turn a similar number of independent operatives.

The work of a country then being limited (by the capital and market for the produce), there can be but two modes of setting paupers to labour: (1) by throwing the self-supporting operatives out of employment altogether, and substituting pauper labourers in their stead; (2) by giving a portion of the work to the paupers, and so decreasing the employment, and consequently the wages, of the regular operatives. In either case, however, the independent labourers must be reduced to a state of comparative or positive dependence, for *it is impossible to make labourers of the paupers of an over-populated country without making paupers of the labourers.*

Some economists argue that, as paupers are consumers, they should, whenever they are able to work, be made producers also, or otherwise they exhaust the national wealth, to which they do not contribute. This might be a sound axiom were there work sufficient for all. But in an over-populated country there is not work enough, as is proven by the mere fact of the over-population; and the able-bodied paupers *are* paupers simply *because they cannot obtain work*, so that to employ those who are out of work is to throw out those who are in work, and thus to pauperize the self-supporting.

The whole matter seems to hinge upon this one question—

Who are to maintain the paupers? The rate-paying traders or the non-ratepaying workmen?

If the paupers be set to work in a country like Great Britain, they must necessarily be brought into competition with the self-supporting workmen, and so be made to share the wage fund with them, decreasing the price of labour in proportion to the extra number of such pauper labourers among whom the capital of the trade has to be shared. Hence the burden of maintaining the paupers will be virtually shifted from the capitalist to the labourer, the poor-rate being thus really paid out of the wages of the operatives, instead of the profits of the traders, as it should be.

And here lies the great wrong of pauper labour. It saddles the poor with the maintenance of their poorer brethren, while the rich not only contribute nothing to their support, but are made still richer by the increased cheapness resulting from the depreciation of labour and their consequent ability to obtain a greater quantity of commodities for the same amount of money.

In illustration of this argument let us say the wages of 600 independent scavagers amount, at 15*s.* a week each the year through, to 23,400*l.* per annum; and let us say, moreover, that the keep of 400 paupers amounts, at 5*s.* a week each, to, altogether, 5200*l.*; hence the total annual expense to the several metropolitan parishes for cleansing the streets and maintaining 400 paupers would be 23,400*l.* + 5200*l.* = 28,600*l.*

If, however, the 400 paupers be set to scavaging work, and made to do something for their keep, one of two things *must* follow: (1) either the 400 extra hands will receive their share of the 23,400*l.* devoted to the payment of the operative scavagers, in which case the wages of each of the regular hands will be reduced from 15*s.* to 9*s.* a week; hence the maintenance of the paupers will be saddled upon the 600 independent operatives, who will lose no less than 9360*l.* per annum, while the ratepayers will be saved the maintenance of the 400 paupers and so gain 5200*l.* per annum by the change; (2) or else 400 of the self-supporting operatives must be thrown out of work, in which case the displaced labourers will lose no less than 15,600*l.*, while the ratepayers will gain upwards of 5000*l.*

The reader is now, I believe, in a position to comprehend the wrong done to the self-supporting scavagers by the employment of pauper labour in the cleansing of the streets.

The preparation of the material of the roads of a parish seems, as far as the metropolis is concerned, at one time to have supplied the chief "test," to which parishes have resorted, as regards the willingness to labour on the part of the able-bodied applicants for relief. When the casual wards of the workhouses were open for the reception of all vagrants who sought a night's shelter, each tramper was required to break so many stones in the morning before receiving a certain allowance of bread, soup, or what not for his breakfast; and he then might be received again into the shelter of this casual asylum. In some parishes the wards were open without the test of stone-breaking, and there was a crowded resort to them, especially during the prevalence of the famine in Ireland and the immigration of the Irish peasants to England. The favourite resort of the vagrants was Marylebone workhouse, and Irish immigrants very frequently presented slips of paper on which some tramper whom they had met with on their way had written "*Marylebone workhouse*," as the best place at which they could apply, and these the simple Irish offered as passports for admission!

Gradually, the asylum of these wards, with or without labour tests, was discontinued, and in one where the labour test used to be strongly insisted upon—in St. Pancras—a school for pauper children has been erected on the site of the stone-yard.

This labour test was unequal when applied to all comers; for what was easy work to an agricultural labourer, a railway excavator, a quarryman, or to any one used to wield a hammer, was painful and blistering to a starving tailor. Nor was the test enforced by the overseers or regarded by the paupers as a proof of willingness to work, but simply as a punishment for poverty, and as a means of deterring the needy from applying for relief. To make labour a punishment, however, is *not* to destroy, but really to confirm, idle habits; it is to give a deeper root to the vagrant's settled aversion to work. "Well, I always thought it was unpleasant," the vagabond will say to himself "*that* working for one's bread, and now I'm *convinced* of it!" Again, in many of the workhouses the labour to which the paupers were set was of a manifestly unremunerative character, being work for mere work's sake; and to apply people to unproductive labour is to destroy all the ordinary motives to toil—to take away the only stimulus to industry, and remove the very will to work which the labour test was supposed to discover *.

The labour test, then, or setting the poor to work as a proof of their willingness to labour, appears to be as foolish as it is vicious; the objections to it being—(1) the inequality of the test applied to different kinds of work-people; (2) the tendency of it to confirm rather than weaken idle habits by making labour inordinately repulsive; (3) the removal of the ordinary stimulus to industry by the unproductiveness of the work to which the poor are generally applied.

And now, having dealt with the subject of parish labour as a test of the willingnes to work on the part of the applicants for relief, I will proceed to deal with that portion of the work itself which is connected with the cleansing of the streets.

And first as to the employment of paupers at all in the streets. If pauperism be a disgrace, then it is unjust to turn a man into the public thoroughfares, wearing the badge of beggary, to be pointed at and scorned for his poverty, especially when we are growing so particularly studious of our criminals that we make them wear masks to prevent even their faces being seen †. Nor is it consistent with the principles of an enlightened national morality that we should force a body of honest men to labour upon the highways, branded with a degrading garb, like convicts. Neither is it *wise* to do so, for the shame of poverty soon becomes deadened by the repeated exposure to public scorn; and thus the occasional recipient of parish relief is ultimately

* Mr. Sidney Herbert informed me, that when he was connected with the Ordnance Department the severest punishment they could discover for idleness was the piling and unpiling of cannon shot; but surely this was the consummation of official folly! for idleness being simply an aversion to work, it is almost self-evident that it is *impossible* to remove this aversion by making labour inordinately irksome and repulsive. Until we understand the means by which work is made pleasant, and can discover other modes of employing our paupers and criminals, all our workhouse and prison discipline is idle tyranny.

† This is done at the Model Prison, Pentonville.

converted into the hardened and habitual pauper. "Once a pauper always a pauper," I was assured was the parish rule; and here lies the *rationale* of the fact. Not long ago this system of employing *badged* paupers to labour in the public thoroughfares was carried to a much more offensive extent than it is even at present. At one time the pauper labourers of a certain parish had the attention of every passer-by attracted to them while at their work, for on the back of each man's garb—a sort of smock-frock—was marked, with sufficient prominence, "CLERKENWELL. STOP IT!" This public intimation that the labourers were not only paupers, but regarded as thieves, and expected to purloin the parish dress they wore, attracted public attention, and was severely commented upon at a meeting. The "STOP IT!" therefore was cancelled, and the frocks are now *merely* lettered "CLERKENWELL." Before the alteration the men very generally wore the garment inside out.

The present dress of the parish scavagers is usually a loose smock-frock, costing 1*s.* 6*d.* to 2*s*, and a glazed hat of about the same price. In some cases, however, the men may wear these things or not, at their option.

The pauper scavagers employed by the several metropolitan parishes may be divided into three classes:—

1. The in-door paupers, who receive no wages whatever (their lodging, food, and clothing being considered to be sufficient remuneration for their labour).

2. The out-door paupers, who are paid partly in money and partly in kind, and employed in some cases three days and in others six days in the week.

   These may be subdivided into—(*a*) the single men, who receive, or rather used to receive, 9*d.* and a quartern loaf for each of the three or more days they were so employed; (*b*) the married men with families, who receive 7*s.* and 3 quartern loaves a week to 1*s.* 1½*d.* and 1 quartern loaf for each day's labour.

3. The unemployed labourers of the district, who are set to scavaging work by the parish, and paid a regular money wage—the employment being constant, and the rate of remuneration ranging from 1*s.* 3*d.* to 2*s.* 6*d.* a day for each of the six days, or from 7*s.* 6*d.* to 15*s.* a week.

In pp. 246, 247, I give a table of the wages paid by each of the metropolitan parishes. This has been collected at great trouble in order to arrive at the truth on this most important matter, and for which purpose the several parishes have been personally visited. It will be seen on reference to this document, that there is only one parish at present that employs its in-door paupers in the scavaging of the public streets; and 3 parishes employing 48 out-door paupers, who are paid partly in money and partly in bread; the money remuneration ranging from 1*s.* 1½*d.* a day (paid by Clerkenwell) to 7*s.* a week (paid by Chelsea), and moreover 31 parishes employing 408 applicants for relief (paupers they cannot be called), and paying them wholly in money, the remuneration ranging from 15*s.* per week to 7*s.* 6*d.* (paid by the Liberty of the Rolls), and the employment from 6 to 3 days weekly. As a general rule it was found that the greatest complaints were made by the authorities as to the idleness of the poor, and by the poor as to the tyranny of the authorities, in those parishes where the remuneration was the least. In St. Luke's, Chelsea, for instance, where the remuneration is but 7*s.* a week and three loaves, the criminations and recriminations by the parish functionaries and the paupers were almost equally harsh and bitter. I should, however, observe that the men employed in this parish spoke in terms of great commendation of Mr. Pattison the surveyor, saying he always gave them to understand that they were free labourers, and invariably treated them as such. The men at work for Bermondsey parish also spoke very highly of their superintendent, who, it seems, has interested himself to obtain for them a foul-weather coat. Some of the highway boards or trusts take all the pauper labourers sent them by the parish, while others give employment only to such as please them. These boards generally pay good wages, and are in favour with the men.

The mode of working, as regards the use of the implements and the manual labour, is generally the same among the pauper scavagers as I have described in connection with the scavagers generally.

The consideration of what is the rate of parish pay to the poor who are employed as scavagers, is complicated by the different modes in which the employment is carried out, for, as we see, there is—1st, the scavaging labour, by workhouse inmates, without any payment beyond the cost of maintenance and clothing; 2nd, the "short" or three-days-a-week labour, with or without "relief" in the bestowal of bread; and 3rd, the six days' work weekly, with a money wage and no bread, nor anything in the form of payment in kind or of "relief."

Let me begin with the first system of labour above mentioned, viz. the employment of the in-door paupers without wages of any kind, their food, lodging, and clothing being considered as equivalents for their work. The principal evil in connection with this form of parish work is its compulsory character, the men regarding it not as so much work given in exchange for such and such comforts, but as something *exacted* from them; and, to tell the truth, it is precisely the counterpart of slavery, being equally deficient in all inducement to toil, and consequently requiring almost the same system of compulsion and supervision in order to keep the men at their labour. All interest in the work is destroyed, there being no reward connected with it; and consequently the same organized system of setting to work is required as with cattle. There are but two inducements to voluntary action—pain to be avoided or pleasure to be derived—or, in other words, the attractiveness and repulsiveness of objects. Take away the pecuniary attraction of labour, and men become mere beasts of burden, capable of being set to work only by the dread of some punishment; hence the system of parish labour, which

has no reward directly connected with it, must necessarily be tyrannical, and so tend to induce idleness and a hatred of work altogether.

Of the different forms of pauper work, street-sweeping is, I am inclined to believe, the most unpopular of all among the poor. The scavaging is generally done in the workhouse dress, and that to all, except the hardened paupers, and sometimes even to them, is highly distasteful. Neither have such labourers, as I have said, the incentive of that hope of the reward which, however diminutive, still tends to sweeten the most repulsive labour. I am informed by an experienced gangsman under a contractor, that it is notorious that the workhouse hands are the least industrious scavagers in the streets. "They don't sweep as well," he said, "and don't go about it like regular men; they take it quite easy." It is often asserted that this labour of the workhouse men is applied as a *test;* but this opinion seems rather to bear on the past than the present.

One man thus employed gave me the following account. He was garrulous but not communicative, as is frequently the case with men who love to hear themselves talk, and are not very often able to command listeners. He was healthy looking enough, but he told me he was, or had been "delicate." He querulously objected to be questioned about his youth, or the reason of his being a pauper, but seemed to be abounding in workhouse stories and workhouse grievances.

"Street-sweeping," he said, "degrades a man, and if a man's poor he hasn't no call to be degraded. Why can't they set the thieves and pickpockets to sweep? they could be watched easy enough; there's always idle fellers as reckons theirselves real gents, as can be got for watching and sitch easy jobs, for they gets as much for them, as three men's paid for hard work in a week. I never was in a prison, but I've heerd that people there is better fed and better cared for than in workusses. What's the meaning of that, sir, I'd like for to know. You can't tell me, but I can tell you. The workus is made as ugly as it can be, that poor people may be got to leave it, and chance dying in the street rather." [Here the man indulged in a gabbled detail of a series of pauper grievances which I had a difficulty in diverting or interrupting. On my asking if the other paupers had the same opinion as to street-sweeping as he had, he replied:—] "To be sure they has; all them that has sense to have a'pinion at all has; there's not two sides to it any how. No, I don't want to be kept and do nothink. I want *proper* work. And by the rights of it I might as well be kept with nothink to do as —— or ——" [parish officials]. "Have they nothing to do," I asked? "Nothink, but to make mischief and get what ought to go to the poor. It's salaries and such like as swallers the rates, and that's what every poor family knows as knows anythink. Did I ever like my work better? Certainly not. Do I take any pains with it? Well, where would be the good? I can sweep well enough, when I please, but if I could do more than the best man as ever Mr. Darke paid a pound a week to, it wouldn't be a bit better for me—not a bit, sir, I assure you. We all takes it easy whenever we can, but the work *must* be done. The only good about it is that you get outside the house. It's a change that way certainly. But we work like horses and is treated like asses." [On my reminding him that he had just told me that they all took it easy when they could, and *that* rather often, he replied:] "Well, don't horses? But it ain't much use talking, sir. It's only them as has been in workusses and in parish work as can understand all the ins and outs of it."

In giving the above and the following statements I have endeavoured to elicit the *feelings* of the several paupers whom I conversed with. Poor, ignorant, or prejudiced men may easily be mistaken in their opinions, or in what they may consider their "facts," but if a clear exposition of their sentiments be obtained, it is a guide to the truth. I have, therefore, given the statement of the in-door pauper's opinions, querulously as they were delivered, as I believe them to be the sentiments of those of his class who, as he said, had any opinion at all.

It seems indeed, from all I could learn on the subject, that pauper street-work, even at the best, is unwilling and slovenly work, pauper workmen being the worst of all workmen. If the streets be swept clean, it is because a dozen paupers are put to the labour of eight, nine, or ten regular scavagers who are independent labourers, and who may have some "pride of art," or some desire to show their employers that they are to be depended upon. This feeling does not actuate the pauper workman, who thinks or knows that if he did evince a desire and a perseverance to please, it would avail him little beyond the sneers and ill-will of his mates; so that, even with a disposition to acquire the good opinion of the authorities, there is this obstacle in his way, and to most men who move in a circumscribed sphere it is a serious obstacle.

Of the second mode of pauper scavaging, viz., that performed by out-door paupers, and paid for partly in money and partly in kind, I heard from officials connected with pauper management very strong condemnations, as being full of mischievous and degrading tendencies. The payment to the out-door pauper scavager averages, as I have stated, 9*d.* a day to a single man, with, perhaps, a quartern loaf; and this, in some cases, is for only three days in the week; while to a married man with a family, it varies between 1*s.* 1½*d.* and 1*s.* 2*d.* a day, with a quartern, and sometimes two quartern loaves; and this, likewise, is occasionally from three to six days in the week. On this the single or family men must subsist, if they have no other means of earning an addition. The men thus employed are certainly not independent labourers, nor are they, in the full sense of the word as popularly understood, paupers; for their means of subsistence are partly the fruits of their toil; and although they are wretchedly dependent, they seem to feel that they have a sort of right to be set to work, as the law ordains such modicum of relief, in or out of the workhouse, as will only ward off death through hunger. This "three-

days-a-week work" is by the poor or pauper labourers looked upon as being, after the in-door pauper work, the worst sort of employment.

From a married man employed by the parish under this mode, I had the following account.

He was an intelligent-looking man, of about 35, but with nothing very particular in his appearance unless it were a head of very curly hair. He gave me the statement in his own room, which was larger than I have usually found such abodes, and would have been very bare, but that it was somewhat littered with the vessels of his trade as a street-seller of Nectar, Persian Sherbet, Raspberryade, and other decoctions of coloured ginger-beer, with high-sounding names and indifferent flavour: in the summer he said he could live better thereby, with a little costering, than by street-sweeping, but being often a sickly man he could not do so during the uncertainties of a winter street trade. His wife, a decent looking woman, was present occasionally, suckling one child, about two years old—for the poor often protract the weaning of their children, as the mother's nutriment is the *cheapest* of all food for the infant, and as the means of postponing the further increase of their family—whilst another of five or six years of age sat on a bench by her side. There was nothing on the walls in the way of an ornament, as I have seen in some of the rooms of the poor, for the couple had once been in the workhouse, and might be driven there again, and with such apprehensions did not care, perhaps, to make a home otherwise than they found it, even if the consumption of only a little spare time were involved.

The husband said:—

"I was brought up as a type-founder; my father, who was one, learnt me his trade; but he died when I was quite a young man, or I might have been better perfected in it. I was comfortably off enough then, and got married. Very soon after that I was taken ill with an abscess in my neck, you can see the mark of it still." [He showed me the mark.] "For six months I wasn't able to do a thing, and I was a part of the time, I don't recollect how long, in St. Bartholomew's Hospital. I was weak and ill when I came out, and hardly fit for work; I couldn't hear of any work I could get, for there was a great bother in the trade between master and men. Before I went into the hospital, there was money to pay to doctors; and when I came out I could earn nothing, so everything went, yes, sir, everything. My wife made a little matter with charing for families she'd lived in, but things are in a bad way if a poor woman has to keep her husband. She was taken ill at last, and then there was nothing but the parish for us. I suffered a great deal before it come to that. It was awful. No one can know what it is but them that suffers it. But I didn't know what in the world to do. We lived then in St. Luke's, and were passed to our own parish, and were three months in the workhouse. The living was good enough, better then than it is now, I've heard, but I was miserable." ["And I was *very* miserable," interposed the wife, "for I had been brought up comfortable; my father was a respectable tradesman in St. George's-in-the-East, and I had been in good situations."] "We made ourselves," said the husband, "as useful as we could, but we were parted of course. At the three months' end, I had 10*s.* given to me to come out with, and was told I might start costermongering on it. But to a man not up to the trade, 10*s.* won't go very far to keep up costering. I didn't feel master enough of my own trade by this time to try for work at it, and work wasn't at all regular. There were good hands earning only 12*s.* a week. The 10*s.* soon went, and I had again to apply for relief, and got an order for the stone-yard to go and break stones. Ten bushels was to be broken for 15*d.* It was dreadful hard work at first. My hands got all blistered and bloody, and I've gone home and cried with pain and wretchedness. At first it was on to three days before I could break the ten bushels. I felt shivered to bits all over my arms and shoulders, and my head was splitting. I then got to do it in two days, and then in one, and it grew easier. But all this time I had only what was reckoned three days' work in a week. That is, you see, sir, I had only three times ten bushels of stones given to break in the week, and earned only 3*s.* 9*d.* Yes, I lived on it, and paid 1*s.* 6*d.* a week rent, for the neighbours took care of a few sticks for us, and the parish or a broker wouldn't have found them worth carriage. My wife was then in the country with a sister. I lived upon bread and dripping, went without fire or candle (or had one only very seldom) though it wasn't warm weather. I can safely say that for eight weeks I never tasted one bite of meat, and hardly a bite of butter. When I couldn't sleep of a night, but that wasn't often, it was terrible, very. I washed what bits of things I had then myself, and had sometimes to get a ha'porth of soap as a favour, as the chandler said she 'didn't make less than a penn'orth.' If I eat too much dripping, it made me feel sick. I hardly know how much bread and dripping I eat in a week. I spent what money I had in it and bread, and sometimes went without. I was very weak, you may be sure, sir; and if I'd had the influenza or anything that way, I should have gone off like a shot, for I seemed to have no constitution left. But my wife came back again and got work at charing, and made about 4*s.* a week at it; but we were still very badly off. Then I got to work on the roads every day, and had 1*s.* and a quartern loaf a day, which was a rise. I had only one child then, but men with larger families got two quartern loaves a day. Single men got 9*d.* a day. It was far easier work than stone-breaking too. The hours were from eight to five in winter, and from seven to six in summer. But there's always changes going on, and we were put on 1*s.* 1½*d.* a day and a quartern loaf, and only three days a week. All the same as to time of course. The bread wasn't good; it was only cheap. I suppose there was 20 of us working most of the times as I was. The gangsman, as you call him, but that's more for the regular hands, was a servant of the parish, and a great tyrant.

Yes, indeed, when we had a talk among ourselves, there was nothing but grumbling heard of. Some of the tales I've heard were shocking; worse than what I've gone through. Everybody was grumbling, except perhaps two men that had been 20 years in the streets, and were like born paupers. They didn't feel it, for there's a great difference in men. They knew no better. But anybody might have been frightened to hear some of the men talk and curse. We've stopped work to abuse the parish officers as might be passing. We've mobbed the overseers, and a number of us, I was one, were taken before the magistrate for it; but we told him how badly we were off, and he discharged us, and gave us orders into the workhouse, and told 'em to see if nothing could be done for us. We were there till next morning, and then sent away without anything being said.

"It's a sad life, sir, is a parish worker's. I wish to God I could get out of it. But when a man has children he can't stop and say 'I can't do this,' and 'I won't do that.' Last week, now, in costering, I lost 6s.'" [he meant that his expenses, of every kind, exceeded his receipts by 6s.], and though I can distil nectar, or anything that way," [this was said somewhat laughingly], "it's only when the weather's hot and fine that any good at all can be done with it. I think, too, that there's not the money among working men that there once was. Anything regular in the way of pay must always be looked at by a man with a family.

"Of course the streets must be properly swept, and if I can sweep them as well as Mr. Dodd's men, for I know one of them very well, why should I have only 3s. 4½d. a week and three loaves, and he have 16s, I think it is. I don't drink, my wife knows I don't" [the wife assented], "and it seems as if in a parish a man must be kept down when he is down, and then blamed for it. I may not understand all about it, but it looks queer."

From an *unmarried* man, looking like a mere boy in the face, although he assured me he was nearly 24, as far as he knew, I heard an account of his labour and its fruits as a parish scavager; also of his former career, which partakes greatly in its characteristics of the narratives I gave, toward the close of the first volume, of deserted, neglected, and runaway children.

He lived from his earliest recollection with an old woman whom he first called "grandmother," and was then bid to call "aunt," and she, some of the neighbours told him, had "kept him out of his rights," for she had 4s. a week with him, so that there ought to have been money coming to him when he grew up. I have sometimes heard similar statements from the ignorant poor, for it is agreeable enough to them to fancy that they have been wronged out of fortunes to which they were justly entitled, and deprived of the position and consequence in life which they ought to have possessed "by rights." In the course of my inquiries among the poor women who supply the slop milliners' shops with widows' caps, cap fronts, women's collars, &c., &c., I was told by one middle-aged cap-maker, a very silly person, that she would be worth 100,000*l*, "if she had her rights." What those "rights" were she could not explain, only that there was and had been a great deal of money in the family, and of course she had a right to her share, only she was kept out of it.

The youth in question never heard of a father, and had been informed that his mother had died when he was a baby. From what he told me, I think it most probable that he was an illegitimate child, for whose maintenance his father possibly paid the 4s. a week, perhaps to some near relative of the deceased mother. The old woman, as well as I could make the matter out from his narrative, died suddenly, and, as little was known about her, she was buried by the parish, and the lad, on the evening of the funeral, was to have been taken by the landlord of the house where they lodged into the workhouse; but the boy ran away before this could be accomplished; the parish of course not objecting to be relieved of an incumbrance. He thought he was then about twelve or thirteen years of age, and he had before run away from two schools, one a Ragged-school, to which he had been sent, "*for it was so confining*," he said, "and one master, not he as had the raggeds, leathered him," to use his own words, "tightly." He knew his letters now, he thought, but that was all, and very few," he said, gravely, "would have put up with it so long as I did." He subsisted as well as he could by selling matches, penny memorandum books, onions, &c., after he had run away, sleeping under hedges in the country, or in lodging-houses in town, and living on a few pence a day, or "starving on nothink." He was taken ill, and believed it was of a fever, at or somewhere about Portsmouth, and when he was sufficiently recovered, and had given the best account he could of himself, was passed to his parish in London. The relieving officer, he said, would have given him a pair of shoes and half-a-crown, and let him "take his chance, but the doctor wouldn't sartify any ways." He meant, I think, that the medical officer found him too ill to be at large on his own account. He discharged himself, however, in a few weeks from this parish workhouse, as he was convalescent. "The grub there, you see, sir," he said, "was stunning good when I first went, but it fell off." As the probability is that there was no change in the diet, it may not be unfair to conclude that the regular meals of the establishment were very relishable at first, and that afterwards their very regularity and their little variation made the recipient critical.

"When I left, sir," he stated, "they guv me 2s. 6d., and a tidy shirt, and a pair of blucherers, and mended up my togs for me decent. I tried all sorts of goes then. I went to Chalk-farm and some other fairs with sticks for throwing, and used to jump among them as throwing was going on, and to sing out, 'break my legs and miss my pegs.' I got many a knock, and when I did, oh! there *was* such larfing at the fun on it. I sold garden sticks too, and garden ropes, and posts sometimes; but it was all wery poor pay. Sometimes I made 10d.,

but not never I think but twice 1*s.* a day at it, and oftener 6*d.*, and in bad weather there was nothink to be done. If I made 6*d.* clear, it was 1*d.* for cawfee—for I often went out fasting in a morning —and 1*d.* for bread and butter, and 1*d.* for pudden for dinner, and another 1*d.* perhaps for beer—half-pint and a farden out at the public bar—and 2*d.* for a night's lodging. I've had sometimes to leave half my stock in flue with a deputy for a night's rest. O, I didn't much mind the bugs, so I could rest; and next day had to take my things out if I could, and pay a hexter ha'penny or penny, for hintrest, like. Yes, I've made 18*d.* a hevening at a fair; but there's so many a going it there that one ruins another, and wet weather ruins the whole biling, the pawillion, theaytres and all. I never was a hactor, never; but I've thought sometimes I'd like to try my hand at it. I may some day, 'cause I'm tall. I was forced to go to the parish again, for I got ill and dreadful weak, and then they guv me work on the roads. I can't just say how long it's since, two or three year perhaps, but I had 9*d.* a day at first, and reglar work, and then three days and three loaves a week, and then three days and no loaves. I haven't been at it werry lately. I've rayther taken the summer out of myself, but I must go back soon, for cold weather 's a coming. Vy, I lived a good deal on carrying trunks from the busses to Euston Railway; a good many busses stops in the New-road, in the middle of the square. Some was foreigners, and they was werry scaly. No, I never said nothink but once, ven I got two French ha'pennies for carrying a heavy old leather thing, like a coach box, as seemed to belong to a family; and then the railway bobbies made me hold my tongue. I jobbed about in other places too, but the time's gone by now. O, I had a deal to put up with last winter. What is 9*d.* a day for three days? and if poor men had their rights, times 'ud be different. I'd like to know where all the money goes. I never counted how many parish sweepers there was; too many by arf. I've a rights to work, and it 's as little as a parish can do to find it. I pay 1*s.* a week for half a bed, and not half enough bed-clothes; but me and Jack Smith sometimes sleeps in our clothes, and sometimes spreads 'em o' top. No, poor Jack, he hasn't no hold on a parish; he's a mud-lark and a gatherer [bone-grubber]. Do I like the overseers and the parish officers? In course not, nobody does. Why don't they? Well, how can they? that 's just where it is. Ven I haven't been at sweeping, I've staid in bed as long as I was let; but Mother B.—I don't know no other name she has—wouldn't stand it after ten. O no, it wern't a common lodging-house, a sort of private lodging-house perhaps, where you took by the week. If I made nothink but my ninepences, I lived on bread and cawfee, or bread and coker, and sometimes a red herring, and I've bought 'em in the Brill at five and six a penny. Mother B. charged ½*d.* for leave to toast 'em on her gridiron. She *is* a scaly old ——. *I've oft spent all my money in a tripe supper at night, and fasted all next day.* I used to walk about and look in at the cook-shop windows, and try for a job next day. *I'd have gone five miles for anybody for a penn'orth of pudden.* No, I never thought of making away with myself; never. Nor I never thought of going for a soldier; *it wouldn't suit me to be tied so.* What I want is this here—regular work and no jaw. O, I'm sometimes as miserable as hunger 'll make a parson, if ever he felt it. Yes, I go to church sometimes when I'm at work for the parish, if I'm at all togged. No doubt I shall die in the workus. You see there's nobody in the world cares for me. I can't tell just how I spend my money; just as it comes into my head. No, I don't care about drinking; it don't agree with me; but there's some can live on it. I don't think as I shall ever marry, though who knows?"

The third and last system of parish work is where the labourer is employed regularly, and paid a fixed wage, out of the parochial fund certainly, but not in the same manner as the paupers are paid, nor with any payment in kind (as in loaves), but all in money. The payment in this wise is usually 1*s.* 6*d.* a day, and, but for such employment, the poor so employed, would, in most instances, apply for relief.

In one parish, where the poor are regularly employed in street sweeping, and paid a regular wage in money, the whole scavaging work is done by the paupers, as they are usually termed, though they are not "on the rate." By them the streets are swept and the houses dusted, the granite broken for macadamization, and the streets and roads repaved or repaired. This is done by about 50 men, the labour in the different departments I have specified being about equally apportioned as to the number employed in each. The work is executed without any direct intervention of the parish officers employed in administering *relief* to the poor, but through the agency of a board. All the men, however, are the poor of the parish, and but for this employment would or might claim relief, or demand admittance with their families into the workhouse. The system, therefore, is one of indirect pauper labour. Nearly all the men have been unskilled labourers, the exception being now and then a few operatives in such handicrafts as were suffering from the dearth of employment. Some of the artizans, I was informed, would be earning their 9*s.* in the stone-yard one week, and the next getting 30*s.* at their business. The men thus labouring for the parish are about three-fifths Irishmen, a fifth Welchmen, or rather more than a fifth, and the remainder Englishmen. There is not a single Scotchman among them.

There is no difference, in the parish I allude to, between the wages of married and single men, but men with families are usually preferred among the applicants for such work. They all reside in their own rooms, or sometimes in lodging-houses, but this rests with themselves.

I had the following account from a heavy and healthy-looking middle-aged man, dressed in a jacket and trousers of coarse corduroy. There is so little distinctive about it, however, that I will

not consume space in presenting it in the narrative form in which I noted it down. It may suffice that the man seemed to have little recollection as to the past, and less care as to the future. His life, from all I could learn from him, had been spent in what may be called menial labour, as the servant, not of an individual, but of a parish; but there was nothing, he knew of, that he had to thank anybody for—parish or any one. They wanted *him* and he wanted *them*. On my asking him if he had never tried to "better himself," he said that he *had* once as a navvy, but a blow on the head and eye, from a portion of rock shivered by his pick-axe, disabled him for awhile, and he left railway work. He went to church, as was expected of him, and he and his wife liked it. He had forgotten how to read, but never was "a dab at it," and so "didn't know nothing about the litany or the psalms." He couldn't say as he knew any difference between the Church of England and the Roman Catholic church-goers, "cause the one was a English and the t' other a Irish religion," and he "wasn't to be expected to understand Irish religion." He saw no necessity to put by money (this he said hesitatingly), supposing he could; what was his parish for? and he would take care he didn't lose his settlement. If he'd ever had such a chance as some had he might have saved money, but he never had. He had no family, and his wife earned about 4*s.* a week, but not every week, in a wool warehouse, and they did middling.

The above, then, are the modes in which paupers, or imminent paupers, so to speak, are employed, and in one way or other are *paid* for their labour, or what is called paid, and who, although parish menials, still reside in their own abodes, with the opportunity, such as it is, of "looking out" for better employment.

As to the *moral qualities of the street-sweeping paupers* I do not know that they differ from those of paupers generally. All men who feel themselves sunk into compulsory labour and a degraded condition are dissatisfied, and eager to throw the blame of their degradation from their own shoulders. But it is evident that these men are unwilling workers, because their work is deprived of its just reward; and although I did not hear of any difficulty being experienced in getting them to work, I was assured by many who knew them well, that they do not go about it with any alertness. Did any one ever hear a pauper whistle or sing at his street-work? I believe that every experienced vestryman will agree to the truth of the statement that it is very rarely a confirmed pauper rises from his degradation. His thoughts and aspirations seem bounded by the workhouse and the parish. The reason appears to be because the workhouse authorities seek rather to degrade than to elevate the man, resorting to every means of shaming the pauper, until at last he becomes so utterly callous to the disgrace of pauperism that he does not care to alter his position. The system, too, adopted by the parish authorities of not paying for work, or paying less than the ordinary prices of the trade, causes the pauper labourers to be unwilling workers; and finding that industry brings no reward, or less than its fair reward, to them, they get to hate all work, and to grow up habitual burdens on the State. Crabbe, the poet, who in all questions of borough and parish life is an authority, makes his workhouse boy, Dick Monday, who when a boy got more kicks than halfpence, die Sir Richard Monday, of Monday-place; but this is a flight on the wings of poetical licence; certainly not impossible, and that is all which can be said for its likelihood.

The following remarks on the payment of the parish street-sweepers are from one of Mr. Cochrane's publications:—

"The council considers it a duty to the poor to touch upon the niggardly manner in which parish scavengers are generally paid, and the deplorable and emaciated condition which they usually present, with regard to their clothing and personal appearance. One contractor pays 16*s.* 6*d.* per week; 2 pay 16*s.*; 12 (including a Highway Board) pay 15*s.* each; 1 pays 14*s.* 6*d.*; 2 pay 14*s.*; and 1 pays so low as 12*s.* On the other hand, five parish boards of 'guardians of the poor,' pay only 9*s.* each, to their miserable mudlarks; one pays 8*s.*; another 7*s.* 5*d.*; a third 7*s.*; a fourth compensates its labourers—in the British metropolis, where rent and living are necessarily higher than elsewhere—with 5*s.* 8*d.* per week! whilst a fifth pays 3 men 15*s.* each, 12 men 10*s.* each, and 6 men 7*s.* 6*d.* each, for exactly the same kind of work!!! But what renders this mean torture of men (because they happen to be poor) absurd as well as cruel, are the anomalous facts, that whilst the guardians of one parish pay 5 men 7*s.* each, the contractor for another part of the same parish, pays his 4 men 14*s.* each;—and whilst the guardians of a second parish pay only 5*s.* 8*d.*, the Highway Board pays 15*s.* to each of its labourers, for performing exactly the same work in the same district!—Mr. Darke, scavenging contractor of Paddington, lately stated that he never had, and never would, employ any man at less than 16*s.* or 18*s.* per week;—and Mr. Sinnott, of Belvidere-road, Lambeth, about three months since, offered to certain West-End guardians, to take 40 paupers out of their own workhouse to cleanse their own parish, on the street-orderly system;—and to pay them 15*s.* per week each man*; but the economical guardians preferred filth and a full workhouse, to cleanliness, Christian charity, and common sense;—and so the proposal of this considerate contractor was rejected! It is certainly far from being creditable to boards of gentlemen and wealthy tradesmen who manage parish affairs, to pay little more than one-half the wages that an individual does, to poor labourers who cannot choose their employment or their masters. . . . .

"The broken-down tradesman, the journeyman deprived of his usual work by panic or by poverty of the times, the ingenious mechanic, or the unsuccessful artist, applies at the parish labour-market for leave to live by other labour than that

* To the honourable conduct of the above-named contractors to their men, I am glad to be able to bear witness. All the men speak in the highest terms of them.

which hitherto maintained him in comfort. . . . . . The usual language of such persons, even when applying for private alms or parochial relief, is, not that they want money, but 'that they have long been out of work;' 'that their particular trade has been overstocked with apprentices, or superseded by machinery;' or, 'that their late employer has become bankrupt, or has discharged the majority of his hands from the badness of the times.' To a man of this class, the guardian of the poor replies, 'We will test your willingness to labour, by employing you in the stone-yard, or to sweep the streets; but the parish being heavily burthened with rates, we cannot afford more than 7*s.* or 8*s.* a week.' The poor creature, conscious of his own helplessness, accepts the miserable pittance, in order to preserve himself and family from immediate starvation. . . . . .

"The council has taken much pains to ascertain the wages, and mode of expenditure of them, by this uncared-for, and almost pariah, class of labourers throughout the metropolitan parishes; and it possesses undeniable proofs, that few possess any further garment than the rags upon their backs; some being even without a change of linen; that they never enter a place of worship, on account of their want of decent clothing; that their wives and children are starved and in rags, and the latter without the least education; that they never by any chance taste fresh animal food; that one-third of their hard earnings is paid for rent; and that their only sustenance (unless their wives happen to go out washing or charing), consists of bread, potatoes, coarse tea without milk or sugar, a salt herring two or three times a week, and a slice of rusty bacon on Sunday morning! The meal called dinner they never know; their only refection being breakfast and 'tea:' beer they do not taste from year's end to year's end; and any other luxury, or even necessary, is out of the question.

"Of the 21 scavengers employed by St. James's parish in 1850, no less than 16," says Mr. Cochrane's report, "were married, with from one to four children each. How the poor creatures who receive but 7*s.* 6*d.* a week support their families, is best known to themselves."

Let me now, in conclusion, endeavour to arrive at a rough estimate as to the sum of which the pauper labours annually are mulct by the before-mentioned rates of remuneration, estimating their labour at the market value or amount paid by the honourable contractors, viz. 16*s.* a week; for if private individuals can afford to pay that wage, and yet reap a profit out of the transaction, the guardians of the poor surely could and should pay the same prices, and not avail themselves of starving men's necessities to reduce the wages of a trade to the very quick of subsistence. If it be a sound principle that the condition of the pauper should be rendered *less* desirable than that of the labourer, assuredly the principle is equally sound that the condition of the labourer should be made *more* desirable than that of the pauper; for if to pamper the pauper be to make indolence more agreeable than industry, certainly to grind down the wages of the labourer is to render industry as unprofitable as indolence. In either case the same premium is proffered to pauperism. As yet the Poor-Law Commissioners have seen but one way of reducing the poor-rates, viz., by rendering the state of the pauper as *unenviable* as possible, and they have wholly lost sight of the other mode of attaining the same end, viz., by making the state of the labourer as *desirable* as possible. To institute a terrible poor law without maintaining an attractive form of industry, is to hold out a boon to crime. If the wages of the working man are to be reduced to bare subsistence, and the condition of the pauper is to be rendered worse than that of the working man, what atrocities will not be committed upon the poor. Elevate the condition of the labourer, and there will be no necessity to depress the pauper. Make work more attractive by increasing the reward for it, and laziness will necessarily become more repulsive. As it is, however, the pauper is not only kept at the very lowest point of subsistence, but his half-starved labour is brought into competition with that of men living in a comparative state of comfort; and the result, of course, is, that instead of decreasing the number of paupers or poor-rates, we make paupers of our labourers, and fill our workhouses by such means. If a scavager's labour be worth from 12*s.* to 15*s.* per week in the market, what moral right have the *guardians of the poor* to pay 5*s.* 8*d.* for the same commodity? If the paupers are set to do work which is fairly worth 15*s.*, then to pay them little more than one-third of the regular value is not only to make unwilling workers of the paupers, but to drag down all the better workmen to the level of the worst.

It may be estimated that the outlay on pauper labour, as a whole, after deducting the sum paid to superintendents and gangers, does not exceed 10*s.* weekly per individual; consequently the lowering of the price of labour is in this ratio: There are now, in round numbers, 450 pauper scavagers in the metropolis, and the account stands thus:—

	Yearly.
450 scavagers, at the regular weekly wages of 16*s.* each . . .	£18,710
450 pauper labourers, 10*s.* each weekly	11,700
Lower price of pauper work . .	£7,020

Hence we see, that the great scurf employers of the scavagers, after all, are the guardians of the poor, compared with whom the most grasping contractor is a model of liberality.

That the minimum of remuneration paid by the parishes has tended, and is tending more and more, to the general depreciation of wages in the scavaging trade, there is no doubt. It has done so directly and indirectly. One man, who had been a last-maker, told me that he left his employment as a London scavager, for he had "come down to the parish," and set off at the close of the summer into Kent for the harvest and hopping, for, when in the country, he had been

more used to agricultural labour than to last, clog, or patten making. He considered that he had not been successful; still he returned to London a richer man by 26*s.* 6*d.* Nearly 20*s.* of this soon went for shoes and necessary clothing, and to pay some arrears of rent, and a chandler's bill he owed, after which he could be trusted again where he was known. He applied to the foreman of a contractor, whom he knew, for work. "What wage?" said the foreman. "Fifteen shillings a week," was the reply. "Why, what did you get from the parish for sweeping?" "Nine shillings." "Well," said the foreman, "I know you're a decent man, and you were recommended before, and so I *can* give you four or five days a week at 2*s.* 4*d.* a day, and no nonsense about hours; *for you know yourself I can get* 50 *men as have been parish workers at* 1*s.* 9*d. a day, and jump at it, and so you mustn't be cheeky.*" The man closed with the offer, knowing that the foreman spoke the truth.

A contractor told me that he could obtain "plenty of hands," used to parish scavaging work, at 10*s.* 6*d.* to 12*s.* a week, whereas he paid 16*s.*

It is evident, then, that the system of pauper work in scavaging has created an increasing market for cheap and deteriorated labour, a market including hundreds of the unemployed at other unskilled labours; and it is hardly to be doubted that the many who have faith in the doctrine that it is the best policy to buy in the cheapest and sell in the dearest market, will avail themselves of the low-priced labour of this pauper-constituted mart.

It is but right to add, that those parishes which pay 15*s.* a week are as worthy of commendation as those which pay 9*s.*, 7*s.* 6*d.* and 7*s.* per week, and 1*s.* 4*d.* and 1*s.* 1½*d.* a day are reprehensible; and, unfortunately, the latter have a tendency to regulate all the others.

OF THE STREET-ORDERLIES.

THIS constitutes the last of the four varieties of labour employed in the cleansing of the public thoroughfares of London. I have already treated of the self-supporting manual labour, the self-supporting machine labour, and the pauper labour, and now proceed to the consideration of the philanthropic labour of the streets.

In the first place, let us understand clearly what is meant by philanthropic labour, and how it is distinguished from pauper labour on the one hand, and self-supporting labour on the other. Self-supporting labour I take to be that form of work which returns not less, and generally something more, than is expended upon it. Pauper labour, on the other hand, is work to which the applicants for parish relief are "set," not with a view to the profit to be derived from it, but partly as a test of their willingness to work, and partly as a means of employing the unemployed; while philanthropic labour is employment provided for the unemployed with the same disregard of profit as distinguishes pauper labour, but with a greater regard for the poor, and as a means of affording them relief in a less degrading manner than is done under the present Poor Law. Pauper and philanthropic labour, then, differ essentially from self-supporting labour in being *non-profitable* modes of employment; that is to say, they yield so bare an equivalent for the sum expended upon the labourers, that none, in the ordinary way of trade, can be found to provide the means necessary for putting them into operation: while pauper labour differs from philanthropic labour, in the fact that the funds requisite for "setting the poor on work" are provided by law as a matter of social policy, whereas, in the case of philanthropic labour, the funds, or a part of them, are supplied by voluntary contributions, out of a desire to improve the labourers' condition. There are, then, two distinguishing features in all philanthropic labour—the one is, that it yields no profit (if it did it would become a matter of trade), and the other, that it is instituted and maintained from a wish to benefit the labourer.

The Street-Orderly system forms part of the operations on behalf of the poor adopted by a society, of which Mr. Charles Cochrane is the president, entitled the "National Philanthropic Association," which is said to have for its object "the promotion of social and salutiferous improvements, street cleanliness, and the employment of the poor, so that able-bodied men may be prevented from burthening the parish-rate, and preserved independent of workhouse, alms, and degradation." Here a twofold object is expressed: the Philanthropic Association seeks not only to benefit the poor by giving them employment, and "preserving them independent of workhouse, alms, and degradation," but to benefit the public likewise, by "promoting social and salutiferous improvements and street cleanliness." I shall deal with each of these objects separately; but first let me declare, so as to remove all suspicion of private feelings tending in any way to bias my judgment in this most important matter, that I am an utter stranger to the President and Council of the Philanthropic Association; and that, whatever I may have to say on the subject of the street-orderlies, I do simply in conformity with my duty to the public—to state truthfully all that concerns the labourers and the poor of the metropolis.

Viewed economically, philanthropic and pauper work may be said to be the regulators of the minimum rate of wages—establishing the lowest point to which competition can possibly drive down the remuneration for labour; for it is evident, that if the self-supporting labourer cannot obtain greater comforts by the independent exercise of his industry than the parish rates or private charity will afford him, he will at once give over working for the trading employer, and declare on the funds raised by assessment or voluntary subscription for his support. Hence, those who wish well to the labourer, and who believe that cheapness of commodities is desirable "only," as Mr. Stewart Mill says (p. 502, vol. ii.), "when the cause of it is, that their production costs little labour, and not when occasioned by that labour's

Original from HARVARD UNIVERSITY

being ill-remunerated;" and who believe, moreover, that the labourer is to be benefited solely by the cultivation of a high standard of comfort among the people — to such, I say, it is evident, that a poor law which reduces the relief to able-bodied labourers to the smallest modicum of food consistent with the continuation of life must be about the greatest curse that can possibly come upon an over-populated country, admitting, as it does, of the reduction of wages to so low a point of mere brutal existence as to induce that recklessness and improvidence among the poor which is known to give so strong an impetus to the increase of the people. A minimized rate of parish relief is necessarily a minimized rate of wages, and admits of the labourers' pay being reduced, by pauper competition, to little short of starvation; and such, doubtlessly, would have been the case long ago in the scavaging trade by the employment of parish labour, had not the Philanthropic Association instituted the system of street-orderlies, and by the payment of a higher rate of wages than the more grinding parishes afforded—by giving the men 12*s.* instead of 9*s.* or even 7*s.* a week—prevented the remuneration of the regular hands being dragged down to an approximation to the parish level. Hence, rightly viewed, philanthropic labour—and, indeed, pauper labour too—comes under the head of a remedy for low wages, as preventing, if properly regulated, the undue depreciation of industry from excessive competition, and it is in this light that I shall now proceed to consider it.

The several plans that have been propounded from time to time, as remedies for an insufficient rate of remuneration for work, are as multifarious as the circumstances influencing the three requisites for production—labour, capital, and land. I will here run over as briefly as possible—abstaining from the expression of all opinion on the subject—the various schemes which have been proposed with this object, so that the reader may come as prepared as possible to the consideration of the matter.

The remedies for low wages may be arranged into two distinct groups, viz., those which seek to increase the labourer's rate of pay *directly*, and those which seek to do so *indirectly*.

The *direct* remedies for low wages that have been propounded are:—

A. *The establishment of a standard rate of remuneration for labour.* This has been proposed to be brought about by three different means, viz.:—

1. By law or government authority; either (*a*) fixing the minimum rate of wages, and leaving the variations above that point to be adjusted by competition (this, as we have seen, is the effect of the poor-law); or, (*b*) settling the rate of wages generally by means of local boards of trade for *conseils de prud'hommes*, consisting of delegates from the workmen and employers, to determine, by the principles of natural equity, a *reasonable* scale of remuneration in the several trades, their decision being binding in law on both the employers and the employed.
2. By public opinion; this has been generally proposed by those who are what Mr. Mill terms "shy of admitting the interference of authority in contracts for labour," fearing that if the law intervened it would do so rashly and ignorantly, and desiring to compass by *moral* sanction what they consider useless or dangerous to attempt to bring about by *legal* means. "Every employer," says Mr. Mill, "they think, *ought* to give *sufficient wages*," and if he does not give such wages willingly, he should be compelled to do so by public opinion.
3. By trade societies or combination among the workmen; that is to say, by the payment of a small sum per week out of the wages of the workmen, towards the formation of a fund for the support of such of their fellow operatives as may be out of employment, or refuse to work for those employers who seek to give less than the standard rate of wages established by the trade.

B. *The prohibition of stoppages or deductions of all kinds from the nominal wages of workmen.* This is principally the object of the Anti-Truck Society, which seeks to obtain an Act of Parliament, enjoining the payment in full of all wages. The stoppages or extortions from workmen's wages generally consist of:—

1. Fines for real or pretended misconduct.
2. Rents for tools, frames, gas, and sometimes lodgings.
3. Sale of trade appliances (as trimmings, thread, &c.) at undue prices.
4. Sale of food, drink, &c., at an exorbitant rate of profit.
5. Payment in public-houses; as the means of inducing the men to spend a portion of their earnings in drink.
6. Deposit of money as security before taking out work; so that the capital of the employer is increased without payment of interest to the workpeople.

C. *The institution of certain aids or additions to wages;* as—

1. Perquisites or gratuities obtained from the public; as with waiters, boxkeepers, coachmen, dustmen, vergers, and others.
2. Beer money, and other "allowances" to workmen.
3. Family work; or the co-operation of the wife and children as a means of increasing the workman's income.
4. Allotments of land, to be cultivated after the regular day's labour.
5. The parish "allowance system," or relief in aid of wages, as practised under the old Poor Law.

D. *The increase of the money value of wages;* by—

Original from HARVARD UNIVERSITY

1. Cheap food.
2. Cheap lodgings; through building improved dwellings for the poor, and doing away with the profit of sub-letting.
3. Co-operative stores; or the "club system" of obtaining provisions at wholesale prices.
4. The abolition of the payment of wages on Sunday morning, or at so late an hour on the Saturday night as to prevent the labourer availing himself of the Saturday's market.
5. Teetotalism; as causing the men to spend nothing in fermented drinks, and so leaving them more to spend on food.

Such are the *direct* modes of remedying low wages, viz., either by preventing the price of labour itself falling below a certain standard; prohibiting all stoppages from the pay of the labourer; instituting certain aids or additions to such pay; or increasing the money value of the ordinary wages by reducing the price of provisions.

The *indirect* modes of remedying low wages are of a far more complex character. They consist of, first, the remedies propounded by political economists, which are—

A. *The decrease of the number of labourers;* for gaining this end several plans have been proposed, as—
   1. Checks against the increase of the population, for which the following are the chief Malthusian proposals:—
      a. Preventive checks for the hindrance of impregnation.
      b. Prohibition of early marriages among the poor.
      c. Increase of the standard of comfort, or requirements, among the people; as a means of inducing prudence and restraint of the passions.
      d. Infanticide; as among the Chinese.
   2. Emigration; as a means of draining off the surplus labourers.
   3. Limitation of apprentices in skilled trades; as a means of preventing the undue increase of particular occupations. This, however, is advocated not by economists, but generally by operatives.
   4. Prevention of family work; or the discouragement of the labour of the wives and children of operatives. This, again, cannot be said to be an "economist" remedy.

B. *Increase of the circulating capital, or sum set aside for the payment of the labourers.*
   1. By government imposts. "Governments," says Mr. Mill, "can create additional industry by creating capital. They may lay on taxes, and employ the amount productively." This was the object of the original Poor Law (43 Eliz.), which empowered the overseers of the poor to "raise weekly, or otherwise, by taxation of every inhabitant, &c., such sums of money as they shall require for providing a sufficient stock of flax, hemp, wool, and other ware or stuff, to set the poor on work."
   2. By the issue of paper money. The proposition of Mr. Jonathan Duncan is, that the government should issue notes equivalent to the taxation of the country, with the view of affording increased employment to the poor; the people being set to work as it were upon credit, in the same manner as the labourers were employed to build the market-house at Guernsey.

C. *The extension of the markets of the country;* by the abolition of all restrictions on commerce, and the encouragement of the free interchange of commodities, so that, by increasing the demand for our products, we may be able to afford employment to an extra number of producers.

The above constitute what, with a few exceptions, may be termed, more particularly, the "economist" remedies for low wages.

D. *The regulation of the quantity of work done by each workman, or the prevention of the undue economizing of labour.* For this end, several means have been put forward.
   1. The shortening the hours of labour, and abolition of Sunday-work.
   2. Alteration of the mode of work; as the substitution of day-work for piece-work, as a means of decreasing the stimulus to over-work.
   3. Extension of the term of hiring; by the substitution of annual engagements for daily or weekly hirings, with a view to the prevention of "casual labour."
   4. Limitation of the number of hands employed by one capitalist; so as to prevent the undue extension of "the large system of production."
   5. Taxation of machinery; with the object, not only of making it contribute its quota to the revenue of the country, but of impeding its undue increase.
   6. The discountenance of every form of work that tends to the making up of a greater quantity of materials with a less quantity of labour; and consequently to the expenditure of a greater proportion of the capital of the country on machinery or materials, and a correspondingly less proportion on the labourers.

E. *"Protective imposts," or high import duties on such foreign commodities as can be produced in this country;* with the view of preventing the labour of the comparatively untaxed and uncivilized foreigner being brought into competition with that of the taxed and civilized producer at home.

F. *"Financial reform," or reduction of the taxation of the country;* as enabling the home labourer the better to compete with the foreigner.

The two latter proposals, and that of the extension of the markets, may be said to seek to remedy low wages by expanding or circumscribing the foreign trade of the country.

G. *A different division of the proceeds of labour.* For this object several schemes have been propounded:—

1. The "tribute system" of wages; or payment of labour according to the additional value which it confers on the materials on which it operates.
2. The abolition of the middleman; whether "sweater," "piece-master," "lumper," or what not, coming between the employer and employed.
3. Co-operation; or joint-stock associations of labourers, with the view of abolishing the profit of the capitalist employer.

H. *A different mode of distributing the products of labour;* with the view of abolishing the profit of the dealer, between the producer and consumer—as co-operative stores, where the consumers club together for the purchase of their goods directly of the producers.

I. *A more general and equal division of the wealth of the country:* for attaining this end there are but two known means:—

1. Communism; or the abolition of all rights to individual property.
2. Agapism; or the voluntary sharing of individual possessions with the less fortunate or successful members of the community.

These remedies may, with a few exceptions (such as the tribute system of wages, and the abolition of middlemen), be said to constitute the socialist and communist schemes for the prevention of distress.

J. *Creating additional employment for the poor;* and so removing the surplus labour from the market. Two modes of effecting this have been proposed:—

1. Home colonization, or the cultivation of waste lands by the poor.
2. Orderlyism, or the employment of the poor in the promotion of public cleanliness, and the increased sanitary condition of the country.

K. *The prevention of the enclosure of commons;* as the means of enabling the poor to obtain gratuitous pasturage for their cattle.

L. *The abolition of primogeniture;* with the view of dividing the land among a greater number of individuals.

M. *The holding of the land by the State,* and equal apportionment of it among the poor.

N. *Extension of the suffrage among the people;* and so allowing the workman, as well as the capitalist and the landlord, to take part in the formation of the laws of the country. For this purpose there are two plans:—

1. "The freehold-land movement," which seeks to enable the people to become proprietors of as much land as will, under the present law, give them "a voice" in the country.
2. Chartism, or that which seeks to alter the law concerning the election of members of Parliament, and to confer the right of voting on every male of mature age, sound mind, and non-criminal character.

O. *Cultivation of a higher moral and Christian character among the people.* This form of remedy, which is advocated by many, is based on the argument, that, without some mitigation of the "selfishness of the times," all other schemes for improving the condition of the people will be either evaded by the cunning of the rich, or defeated by the servility of the poor.

The above I believe to be a full and fair statement of the several plans that have been proposed, from time to time, for alleviating the distress of the people. This enumeration is as comprehensive as my knowledge will enable me to make it; and I have abstained from all comment on the several schemes, so that the reader may have an opportunity of impartially weighing the merits of each, and adopting that, which in his own mind, seems best calculated to effect what, after all, we every one desire—whether protectionist, economist, free-trader, philanthropist, socialist, communist, or chartist—the good of the country in which we live, and the people by whom we are surrounded.

Now we have to deal here with that particular remedy for low wages or distress which consists in creating additional employment for the poor, and of which the street-orderly system is an example.

The increase of employment for the poor was the main object of the 43 Eliz., for which purpose, as we have seen, the overseers of the several parishes were empowered to raise a fund by assessments upon the property of the rich, for providing "a sufficient stock of flax, hemp, wool, and other ware or stuff, to set the poor on work." But though economists, to this day, tell us that "while, on the one hand, industry is limited by capital, so, on the other, every increase of capital gives, or is capable of giving, additional employment to industry, and this without assignable limit,"* nevertheless the great difficulty of carrying out the provisions of the original poor-law has consisted in finding a market for the products of pauper labour, for the frequent gluts in our manufactures are sufficient to teach us that it is one thing to produce and another to dispose of the products; so that to create additional employment for the poor something besides capital is requisite: it is necessary either that they shall be engaged in producing that which they themselves immediately consume, or that for which the market admits of being extended.

The two plans proposed for the employment of the poor, it will be seen, consist (1) in the cultivation of waste lands; (2) in promoting public cleanliness, and so increasing the sanitary condition of the country. The first, it is evident, removes the objection of a market being needed for the products of the labour of the poor, since it pro-

* This is Mr. Mills's second *fundamental* proposition respecting capital (see "Principles of Pol. Econ." p. 82, vol. i.). "What I intend to assert is," says that gentleman, "that the portion (of capital) which is destined to the maintenance of the labourers may—supposing no increase in anything else—be indefinitely increased, without creating an impossibility of finding them employment—in other words, if there are human beings capable of work, and food to feed them, they may always be employed in producing something."

Original from HARVARD UNIVERSITY

poses that their energies should be devoted to the production of the food which they themselves consume; while the second seeks to create additional employment in effecting that increased cleanliness which more enlightened physiological views have not only made more desirable, but taught us to be absolutely necessary to the health and enjoyment of the community.

The great impediment, however, to the profitable employment of the poor, has generally been the unproductive or unavailing character of pauper labour. This has been mainly owing to the fact that the able-bodied who are deprived of employment are necessarily the lowest grade of operatives; for, in the displacement of workmen, those are the first discarded whose labour is found to be the least efficient, either from a deficiency of skill, industry, or sobriety, so that pauper labour is necessarily of the least productive character.

Another great difficulty with the employment of the poor is, that the idle, or those to whom work is more than usually irksome, require a stronger inducement than ordinary to make them labour, and the remuneration for parish work being necessarily less than for any other, those who are pauperized through idleness (the most benevolent among us must allow there are such) are naturally less than ever disposed to labour when they become paupers. All pauper work, therefore, is generally unproductive or unavailing, because it is either inexpert or unwilling work. The labour of the in-door paupers, who receive only their food for their pains, is necessarily of the same compulsory character as slavery; while that of the out-door paupers, with the remuneration often cut down to the lowest subsisting point, is scarcely of a more willing or more availing kind.

Owing to this general unproductiveness, (as well as the difficulty of finding a field for the profitable employment of the unemployed poor,) the labour of paupers has been for a long time past directed mainly to the cleansing of the public thoroughfares. Still, from the degrading nature of the occupation, and the small remuneration for the toil, pauper labourers have been found to be such unwilling workers that many parishes have long since given over employing their poor even in this capacity, preferring to entrust the work to a contractor, with his paid self-supporting operatives, instead.

The founder of the Philanthropic Association appears to have been fully aware of the two great difficulties besetting the profitable employment of the poor, viz., (1) finding a field for the exercise of their labours where they might be "set on work" with benefit to the community, and without injury to the independent operatives already engaged in the same occupation; and (2) overcoming the unwillingness, and consequently the unavailingness, of pauper labour.

The first difficulty Mr. Cochrane has endeavoured to obviate by taking advantage of that growing desire for greater public cleanliness which has arisen from the increased knowledge of the principles governing the health of towns; and the second, by giving the men 12*s.* instead of 9*s.* or 7*s.* a week, or worse than all, 1*s.* 1½*d.* and a quartern loaf a day for three days in the week, and so not only augmenting the stimulus to work (for it should be remembered that wages are to the human machine what the fire is to the steam-engine), but preventing the undue depreciation of the labour of the independent workman. He who discovers the means of increasing the rewards of labour, is as great a friend to his race as he who strives to depreciate them is the public enemy; and I do not hesitate to confess, that I look upon Mr. Charles Cochrane as one of the illustrious few who, in these days of unremunerated toil, and their necessary concomitants—beggars and thieves, has come forward to help the labourers of this country from their daily-increasing degradation. His benevolence is of that enlightened order which seeks to extend rather than destroy the self-trust of the poor, not only by creating additional employment for them, but by rendering that employment less repulsive.

The means by which Mr. Cochrane has endeavoured to gain these ends constitutes the system called Street-Orderlyism, which therefore admits of being viewed in two distinct aspects—first, as a new mode of improving "the health of towns," and, secondly, as an improved method of employing the poor.

Concerning the first, I must confess that the system of scavaging or cleansing the public thoroughfares pursued by the street-orderlies assumes, when contemplated in a sanitary point of view, all the importance and simplicity of a great discovery. It has been before pointed out that this system consists not only in cleansing the streets, but in *keeping* them clean. By the street-orderly method of scavaging, the thoroughfares are continually being cleansed, and so never allowed to become dirty; whereas, by the ordinary method, they are not cleansed *until* they are dirty. Hence the two modes of scavaging are diametrically opposed; under the one the streets are cleansed as fast as dirtied, while under the other they are dirtied as fast as cleansed; so that by the new system of scavaging the public thoroughfares are maintained in a perpetual state of cleanliness, whereas by the old they may be said to be kept in a continual state of dirt.

The street-orderly system of scavaging, however, is not only worthy of high commendation as a more efficient means of gaining a particular end—a simplification of a certain process—but it calls for our highest praise as well for the end gained as for the means of gaining it. If it be really a sound physiological principle, that the Creator has made dirt offensive to every rightly-constituted mind, because it is injurious to us, and so established in us an instinct, before we could discover a reason, for removing all refuse from our presence, it becomes, now that we have detected the cause of the feeling in us, at once disgusting and irrational to allow the filth to accumulate in our streets in front of our houses. If typhus, cholera, and other pestilences are but divine punishments

inflicted on us for the infraction of that most kindly law by which the health of a people has been made to depend on that which is naturally agreeable—cleanliness, then our instinct for self-preservation should force us, even if our sense of enjoyment would not lead us, to remove as fast as it is formed what is at once as dangerous as it should be repulsive to our natures. Sanitarily regarded, the cleansing of a town is one of the most important objects that can engage the attention of its governors; the removal of its refuse being quite as necessary for the continuance of the existence of a people as the supply of their food. In the economy of Nature there is no loss: this the great doctrine of waste and supply has taught us; the detritus of one rock is the conglomerate of another; the evaporation of the ocean is the source of the river; the poisonous exhalations of animals the vital air of plants; and the refuse of man and beasts the food of their food. The dust and cinders from our fires, the "slops" from the washing of our houses, the excretions of our bodies, the detritus and "surface-water" of our streets, have all their offices to perform in the great scheme of creation; and if left to rot and fust about us not only injure our health, but diminish the supplies of our food. The filth of the thoroughfares of the metropolis forms, it would appear, the staple manure of the market-gardens in the suburbs; out of the London mud come the London cabbages: so that an improvement in the scavaging of the metropolis tends not only to give the people improved health, but improved vegetables; for that which is nothing but a pestiferous muck-heap in the town becomes a vivifying garden translated to the country.

Dirt, however, is not only as prejudicial to our health and offensive to our senses, when allowed to accumulate in our streets, as it is beneficial to us when removed to our gardens,—but it is a most expensive commodity to keep in front of our houses. It has been shown, that the cost to the people of London, in the matter of extra washing induced by defective scavaging, is at the least 1,000,000*l.* sterling per annum (the Board of Health estimate it at 2,500,000*l.*); and the loss from extra wear and tear of clothes from brushing and scrubbing, arising from the like cause, is about the same prodigious sum; while the injury done to the furniture of private houses, and the goods exposed for sale in shops, though impossible to be estimated—appears to be something enormous: so that the loss from the defective scavaging of the metropolis seems, at the lowest calculation, to amount to several millions per annum; and hence it becomes of the highest possible importance, economically as well as physiologically, that the streets should be cleansed in the most effective manner.

Now, that the street-orderly system is the only rational and efficacious mode of street cleansing both theory and practice assure us. To allow the filth to accumulate in the streets before any steps are taken to remove it, is the same as if we were never to wash our bodies until they were dirty—it is to be perpetually striving to cure the disease, when with scarcely any more trouble we might prevent it entirely. There is, indeed, the same difference between the new and the old system of scavaging, as there is between a bad and a good housewife: the one never cleaning her house until it is dirty, and the other continually cleaning it, so as to prevent it being ever dirty.

Hence it would appear, that the street-orderly system of scavaging would be a great public benefit, even were there no other object connected with it than the increased cleanliness of our streets; but in a country like Great Britain, afflicted as it is with a surplus population (no matter from what cause), that each day finds the difficulty of obtaining work growing greater, the opening up of new fields of employment for the poor is perhaps the greatest benefit that can be conferred upon the nation. Without the discovery of such new fields, "the setting the poor on work" is merely, as I have said, to throw out of employment those who are already employed; it is not to decrease, but really to increase, the evil of the times—to add to, rather than diminish, the number of our paupers or our thieves. The increase of employment in a nation, however, requires, not only a corresponding increase of capital, but a like increase in the demand or desire, as well as in the pecuniary means, of the people to avail themselves of the work on which the poor are set (that is to say, in the extension of the home market); it requires, also, some mode of stimulating the energies of the workers, so as to make them labour more willingly, and consequently more availingly, than usual. These conditions appear to have been fulfilled by Mr. Cochrane, in the establishment of the street-orderlies. He has introduced, in connection with this body, a system of scavaging which, while it employs a greater number of hands, produces such additional benefits as cannot but be considered an equivalent for the increased expenditure; though it is even doubtful whether, by the collection of the street manure unmixed with the mud, the extra value of that article alone will not go far to compensate for the additional expense; if, however, there be added to this the saving to the metropolitan parishes in the cost of watering the streets—for under the street-orderly system this is not required, the dust never being allowed to accumulate, and consequently never requiring to be "laid"—as well as the greater saving of converting the paupers into self-supporting labourers; together with the diminished expense of washing and doctors' bills, consequent on the increased cleanliness of the streets—there cannot be the least doubt that the employment of the poor as street-orderlies is no longer a matter of philanthropy, but of mere commercial prudence.

Such appear to me to be the principal objects of Mr. Cochrane's street-orderly system of scavaging; and it is a subject upon which I have spoken the more freely, because, being unacquainted with that gentleman, none can suspect me of being prejudiced in his favour, and because I have felt that the good which he has done and is likely to do to the poor, has been comparatively unacknow-

ledged by the public, and that society and the people owe him a heavy debt of gratitude*.

I shall now proceed to set forth the character of the labour, and the condition and remuneration of the labourers in connection with the street-orderly system of scavaging the metropolitan thoroughfares.

The first appearance of the street-orderlies in the metropolis was in 1843. Mr. Charles Cochrane, who had previously formed the National Philanthropic Association, with its eleemosynary soup-kitchens, &c., then introduced the system of street-orderlies, as one enabling many destitute men to support themselves by their labour; as well as, in his estimation, a better, and eventually a more economical, mode of street-cleansing, and partaking also somewhat of the character of a street police.

The first "demonstration," or display of the street-orderly system, took place in Regent-street, between the Quadrant and the Regent-circus, and in Oxford-street, between Vere-street and Charles-street. The streets were thoroughly swept in the morning, and then each man or boy, provided with a hand-broom and dust-pan, removed any dirt as soon as it was deposited. The demonstration was pronounced highly successful and the system effective, in the opinion of eighteen influential inhabitants of the locality who acted as a committee, and who publicly, and with the authority of their names, testified their conviction that "the most efficient means of keeping streets clean, and more especially great thoroughfares, was to prevent the accumulation of dirt, by removing the manure within a few minutes after it has been deposited by the passing cattle; the same having, hitherto, remained during several days."

The cost of this demonstration amounted to about 400*l.*, of which, the Report states, "200*l.* still remains due from the shop-keepers to the Association; which," it is delicately added, "from late commercial difficulties they have not yet repaid" (in 1850).

Whilst the street-orderlies were engaged in cleansing Regent-street, &c., the City Commissioners of the sewers of London were invited to depute some person to observe and report to them concerning the method pursued; but with that instinctive sort of repugnance which seems to animate the great bulk of city officials against improvement of any kind, the reply was, that they "did not consider the same worthy their attention." The matter, however, was not allowed to drop, and by the persevering efforts of Mr. Cochrane, the president, and of the body of gentlemen who form the council of the Association, Cheapside, Cornhill, and the most important parts of the very heart of the city were at length cleansed according to the new method. The ratepayers then showed that *they*, at least, *did* consider "the same worthy of attention," for 8000 out of 12,000 within a few days signed memorials recommending the adoption of what they pronounced an improvement, and a public meeting was held in Guildhall (May 4, 1846), at which resolutions in favour of the street-orderly method were passed. The authorities did not adopt these recommendations, but they ventured so far to depart from their venerable routine as to order the streets to be "swept every day!" This employed upwards of 300 men, whereas at the period when the sages of the city sewers did not consider any proposed improvement in scavagery worthy their attention, the number of men employed by them in cleansing the streets did not exceed 30.

The street-orderly system was afterwards tried in the parishes of St. Paul, Covent-garden, St. James (Westminster), St. Martin-in-the-Fields, St. Anne, Soho, and others—sometimes calling forth opposition, of course from the authorities connected with the established modes of paving, scavaging, &c.

It is not my intention to write a complete history of the street-orderlies, but merely to sketch their progress, as well as describe their peculiar characteristics.

Within these few months public meetings have been held in almost every one of the 26 wards of the City, at which approving resolutions were either passed unanimously or carried by large majorities; and the street-orderly system is now about to be introduced into St. Martin's parish instead of the street-sweeping machine.

As far as the street-orderly system has been tried, and judging only by the testimony of public examination and public record of opinion, the trial has certainly been a success. A memorial to the Court of Sewers, from the ward of Broad-street, supported by the leading merchants of that locality, in recommendation of the employment of street-orderlies, seems to bear more closely on the subject than any I have yet seen.

"Your memorialists," they state, "have observed that those public thoroughfares within the city of London which are now cleansed by street-orderlies, *are so remarkably clean* as to be *almost free from mud in wet, and dust in dry weather*—that *such extreme cleanliness is of great comfort to the public*, and tends to improve the sanitary condition of the ward."

But it is not only in the metropolis that the street-orderlies seem likely to become the established scavagers. The streets of Windsor, I am informed, are now in the course of being cleansed upon the orderly plan. In Amsterdam, there are at present 16 orderlies regularly employed upon scavaging a portion of the city, and in Paris and Belgium, I am assured, arrangements are being made for the introduction of the system into both those cities. Were the street-orderly mode of scavaging to become general throughout this country, it is estimated that employment would be given to 100,000 labourers, so that, with the families of these men, not less than half a million of people would be supported in a state of independence by it. The total number of adult able-bodied paupers relieved—in-door and out-door—throughout England and Wales, on January 1, 1850, was 154,525.

The following table shows the route of the street-orderly operations in the metropolis. A further

* Mr. Cochrane is said, in the Reports of the National Philanthropic Association, to have expended no less than 6000*l.* of his fortune in the institution of the Street-Orderly system of scavaging.

column, in the Report from which the table has been extracted, contained the names of thirteen clergymen who have "weekly read prayers and delivered discourses to the street-orderlies at their respective stations, and recorded flattering testimonials of their conduct and demeanour."

EMPLOYMENT OF STREET-ORDERLIES.

	Localities Cleansed.	No. of Street-Orderlies.	Wives and Children dependent.	Money expended. £	s.	d.

	Total	546	1897	3782	6	1

The period of nine years comprised in the above statement (1843 and 1851 being both included) gives a yearly average, as to the number of the poor employed, exceeding 60, with a similar average of 210 wives and children, and a yearly average outlay of 420*l*. The number of orderlies now employed by the Association is from 80 to 90.

Such, then, is a brief account of the rise and progress of this new mode of street-sweeping, and we now come to a description of the work itself.

"The orderlies," says the Report of the Association, "keep the streets free from mud in winter, and dust in summer; and that with the least possible personal drudgery:—adhering to the principle of operation laid down, viz., that of '*Cleansing and keeping Clean*,' they have merely, after each morning's sweeping and removal of dirt, to keep a vigilant look-out over the surface of street allotted to them; and to remove with the hand-brush and dust-pan, from any particular spot, whatever dirt or rubbish may fall upon it, *at the moment of its deposit*. Thus are the streets under their care kept constantly clean.

"But sweeping and removing dirt," continues the Report, "is not the only occupation of the street-orderly, whilst keeping up a careful inspection of the ground allotted to him. He is also the watchman of house-property and shop-goods; the guardian of reticules, pocket-books, purses, and watch-pockets;—the experienced observer and detector of pickpockets; the ever ready, though unpaid, auxiliary to the police constable. Nay, more;—he is always at hand, to render assistance to both equestrian and pedestrian: if a horse slip, stumble, or fall,—if a carriage break down, or vehicles come into collision,—the street-orderly darts forward to raise and rectify them: if foot-passengers be run over, or knocked down, or incautiously loiter on a crossing, the street-orderly rescues them from peril or death; or warns them of the approaching danger of carriages driving in opposite directions: if other accidents befall pedestrians,—if they fall on the pavement, from sudden illness, faintness, or apoplexy, the street-orderly is at hand to render assistance, or convey them to the nearest surgery or hospital. If strangers are at fault as to the localities of London, or the place of their destination, the orderly, in a civil and respectful manner, directs them on their way. If habitual or professional mendicants are importunate or troublesome, the street-orderly warns them off; or hands them to the care of the policeman. And if a *really* poor or starving fellow-creature wanders in search of food or alms, he leads him to a work-house or soup-kitchen*.

"*Should the system become general* (*of which there is now every good prospect*), *it will be the*

* A street-orderly in St. Martin's-lane recovered a piece of broad-cloth from a man who had just stolen it from a warehouse; others in Drury-lane detected several thefts from provision-shops. Two orderlies in Holborn saved the lives of the guard and driver of one of Her Majesty's mail-carts, the horse having become unmanageable in consequence of the shafts being broken. In St. Mary's Church, Lambeth, a gentleman having fallen down in apoplexy, the orderlies who were attending Divine service, carried him out into the air, and promptly procured him medical aid, but unhappily life was extinct. Many instances have occurred, however, in which they have rendered essential service to the public and to individuals.

means of rescuing no less than TEN THOUSAND PERSONS *and their families from destitution and distress* (in London alone);—from the forlorn and wretched condition which tempts to criminality and outrage, to that of comfort, independence, and happiness—produced by their own industry, aided by the kind consideration of those who are more the favourites of fortune than themselves.

"In conclusion it may be stated, that the street-orderly system will keep the streets and pavements of London and Westminster as clean as the court-yard and hall of any gentleman's private dwelling: it will not only secure the general comfort and health of upwards of two millions of people, but save a vast annual amount to shopkeepers, housekeepers, and others, with regard to the spoiling of their goods by dust and dirt; in the wear and tear of clothes and furniture, by an eternal round of brushing, dusting, scouring, and scrubbing."

The foregoing extract fully indicates the system pursued and results of street-orderlyism. I will now deal with what may be considered *the labour or trade part of the question.*

By the street-orderly plan a district is duly apportioned. To one man is assigned the care of a series of courts, a street, or 500, 1000, 1200, 1500, or 2000 yards of a public way, according to its traffic, after the whole surface has been swept "the first thing in the morning." In Oxford-street, for instance, it has been estimated that 500 yards can be kept clear of the dirt continually being deposited by one man; in the squares, where there is no great traffic, 2000 yards; while in so busy a part as Cheapside, some nine men will be required to be hourly on the look-out. These street-orderlies are confined to their beats as strictly as are policeman, and as they soon become known to the inhabitants, it is a means of checking any disposition to loiter, or to shirk the work; to say nothing of the corps of inspectors and superintendents.

The *division of labour* among the street-orderlies is as follows:—

1. The *foreman*, whose duty is to "look over the men" (one such over-looker being employed to about every 20 men), and who receives 15*s.* per week.

2. The *barrow-men*, or sweepers, consisting of men and boys; the former receiving 12*s.* and the latter generally 7*s.* per week.

The *tools and implements* used, and their cost, are as follows:—wooden scoops, to throw up the slop, 1*s.* 2*d.* each (they used to be made of iron, weighing 8 lbs. each, but the men then complained that the weight "broke their arms"); shovel, 2*s.* 3*d.*; hoe and scraper, 1*s.* 3*d.*; hand-broom, 8*d.*; scavager's broom, 1*s.* 2*d.*; barrow, 12*s.*; covered barrow, 24*s.*

In the amount of his receipts, the street-orderly appears to a disadvantage, as many of the "regular hands" of the contractors receive 16*s.* weekly, and he but 12*s.* The reason for this circumscribed payment I have already alluded to—the deficiency of funds to carry out the full purposes of the Association. Contrasted with the remuneration of the great majority of the pauper scavagers, the street-orderly is in a state of comparative comfort, for he receives nearly double as much as the Guardians of the Poor of Chelsea and the Liberty of the Rolls pay their labourers, and full 25 per cent. more than is paid by Bermondsey, Deptford, Marylebone, St. James's, Westminster, St. George's, Hanover-square, and St. Andrew's, Holborn; and, I am assured, it is the intention of the Council to pay the full rate of wages given by the more respectable scavagers, viz., 16*s.* a week each man. *If traders can do this, philanthropists, who require no profit, at least should be equally liberal.* The labourer never can be benefited by depreciating the ordinary wages of his trade; and I must in justice confess, that there are scattered throughout the Report repeated regrets that the funds of the Association will not admit of a higher rate of wages being paid.

The street-orderly is not subjected to any fines or drawbacks, and is paid always in money, every Saturday evening at the office of the Association. In this respect, however, he does not differ from other bodies of scavagers.

The usual mode of obtaining employment among the street-orderlies is by personal application at the office of the Association in Leicester-square; but sometimes letters, well-penned and well-worded, are addressed to the president.

The daily number of applicants for employment is far from demonstrative of that unbroken prosperity of the country, of which we hear so much. On my inquiring into the number, I ascertained towards the end of August, that, for the previous fortnight, during fine summer weather, London being still full of the visitors to the Exhibition, on an average 30 men, of nearly all conditions of life, applied personally each day for work at street-sweeping, at 12*s.* a week. Certainly this labour is not connected with the feeling of pauper degradation, but it does not look well for the country that in twelve days 360 men should apply for such work. On the year's average, I am assured, there are 30 applications daily, but only ten new applicants, as men call to solicit an engagement again and again. Thus in the year there are *nine thousand, three hundred, and ninety* applications, and 3130 individual applicants. In the course of one month last winter, there were applications from 300 boys in Spitalfields alone, to be set to work; and I am told, that had they been successful, 3000 lads would have applied the next month.

When an application is made by any one recommended by subscribers, &c., to the Association, or where the case seems worthy of attention, the names and addresses are entered in a book, with a slight sketch of the circumstances of the person wishing to become a street-orderly, so that inquiries may be made. I give a few of the more recent of these entries and descriptions, which are really "histories in little":—

"Thomas M'G——, aged 50, W— L— street, Chelsea Hospital, single man. Taught a French and English school in Lyons, France. Driven out of France at the Revolution of 1848. Penniless.

"Rich. M——, 13, C—— street, H—— garden, 42 years. Married. Can read and write. Has been a seaman in the royal service ten years. Chairmaker by trade. Has jobbed as a porter in Rochester, Kent.

"Phil. S——, 1, R— L— street, High Holborn. From Killarney, co. Kerry. Bred a gardener. Fifteen years in constabulary force, for which he has a character from Col. Macgregor, and received the compensation of 50*l.*, which he bestowed on his father and mother to keep them at home. Nine months in England, viz., in Bristol, Bath, and London. Aged 35. Can read and write.

"Edw. C——, 79, M—— street, Hackney. Aged 27. Married. Army-pensioner, 6*d.* a day. Can read and write. Recommended by Rev. T. Gibson, rector of Hackney.

"Chas. J——, 11, D—— street, Chelsea. Aged 38. Gentleman's servant."

In my account of the "regular hands" employed by the contracting scavagers, I have stated that the street-orderlies were a more miscellaneous body, as they had not been reared in the same proportion to street work. They are also, I may add, a better-conducted and better-informed class than the general run of unskilled labourers, as they know, before applying for street-orderly work, that inquiries are made concerning them, and that men of reprobate character will not be employed.

Many of those employed as orderlies have since returned to their original employments; others have procured, and been recommended to, superior situations in life to that of street-orderlies, by the Council of the Association, but *no instance has occurred of any street-orderly having returned back to his parish workhouse or stoneyard.*" This certainly looks well.

One street-orderly, I may add, is now a reputable school-master, and has been so for some time; another is a clerk under similar circumstances. Another is a good theoretical and practical musician, having officiated as organist in churches and at concerts; he is also a neat music copyist. Another tells of his correspondence with a bishop on theological topics. Another, with a long and well-cultured beard, has been a model for artists. One had 150*l.* left to him not long ago, which was soon spent; his wife spent it, he said, and then he quietly applied to be permitted to be again a street-orderly. Several have got engagements as seamen, their original calling—indeed, I am assured, that a few months of street-orderly labour is looked upon as an excellent ordeal of character, after which the Association affirms good behaviour on the part of the employed.

The subscribers to the funds not unfrequently recommend destitute persons to the good offices of the Association, apart from their employment as street-orderlies. Thus, it is only a few weeks ago, that twelve Spanish refugees, none of them speaking English, were recommended to the Association; one of them it was ultimately enabled to establish as a waiter in an hotel resorted to by foreigners, another as an interpreter, another as a gentleman's servant, and another (with a little boy, his son) in shoe-blacking in Leicester-square.

Thus among street-orderlies are to be found a great diversity of career in life, and what may be called adventures.

One great advantage, however, which the orderly possesses over his better paid brethren is in the greater probability of his "rising out of the street." This is very rarely the case with an ordinary scavager.

I now give the following account from one of the street-orderlies, a tall, soldierly-looking man:—

"I'm 42 now," he said, "and when I was a boy and a young man I was employed in the *Times* machine office, but got into a bit of a row—a bit of a street quarrel and frolic, and was called on to pay 3*l.*, something about a street-lamp: that was out of the question; and as I was taking a walk in the park, not just knowing what I'd best do, I met a recruiting sergeant, and enlisted on a sudden—all on a sudden—in the 16th Lancers. When I came to the standard, though, I was found a little bit too short. Well, I was rather frolicsome in those days, I confess, and perhaps *had rather a turn for a roving life*, so when the sergeant said he'd take me to the East India Company's recruiting sergeant, I consented, and was accepted at once. I was taken to Calcutta, and served under General Nott all through the Affghan war. I was in the East India Company's artillery, 4th company and 2nd battalion. Why, yes, sir, I saw a little of what you may call 'service.' I was at the fighting at Candahar, Bowlinglen, Bowling-pass, Clatigillsy, Ghuznee, and Caboul. The first real warm work I was in was at Candahar. I've heard young soldiers say that they've gone into action the first time as merry as they would go to a play. Don't believe them, sir. Old soldiers will tell you quite different. You *must* feel queer and serious the first time you're in action: it's not fear—it's nervousness. The crack of the muskets at the first fire you hear in real hard earnest is uncommon startling; you see the flash of the fire from the enemy's line, but very little else. Indeed, oft enough you see nothing but smoke, and hear nothing but balls whistling every side of you. And then you get excited, just as if you were at a hunt; but after a little service—I can speak for myself, at any rate—you go into action as you go to your dinner.

"I served during the time when there was the Affghanistan retreat; when the 44th was completely cut up, before any help could get up to them. We suffered a good deal from want of sufficient food; but it was nothing like so bad, at the very worst, as if you're suffering in London. In India, in that war time, if you suffered, you were along with a number in just the same boat as yourself; and there's always something to hope for when you're an army. It's different if you're walking the streets of London by yourself—I felt it, sir, for a little bit after my return—and if you haven't a penny, you feel as if there wasn't a hope. If you have friends it may be different, but I had none. It's no comfort if

you know hundreds are suffering as you are, for you can't help and cheer one another as soldiers can.

"Well, sir, as I've told you, I saw a good deal of service all through that war. Indeed I served thirteen years and four months, and was then discharged on account of ill health. If I'd served eight months longer that would have been fourteen years, and I should have been entitled to a pension. I believe my illness was caused by the hardships I went through in the campaigns, fighting and killing men that I never saw before, and until I was in India had never heard of, and that I had no ill-will to; certainly not, why should I? they never did me any wrong. But when it comes to war, if you can't kill them they'll kill you. When I got back to London I applied at the East India House for a pension, but was refused. I hadn't served my time, though that wasn't my fault.

"I then applied for work in the *Times* machine office, and they were kind enough to put me on. But I wasn't master of the work, for there was new machinery, wonderful machinery, and a many changes. So I couldn't be kept on, and was some time out of work, and very badly off, as I've said before, and then I got work as a scavenger. O, I knew nothing about sweeping before that. I'd never swept anything except the snow in the north of India, which is quite a different sort of thing to London dirt. But I very soon got into the way of it. I found no difficulty about it, though some may pretend there is an art in it. I had 15*s.* a week, and when I was no longer wanted I got employment as a street-orderly. I never was married, and have only myself to provide for. I'm satisfied that the street-orderly is far the best plan for street-cleaning. Nothing else can touch it, in my opinion, and I thought so before I was one of them, and I believe most working scavengers think so now, though they mayn't like to say so, for fear it might go again their interest.

"Oh, yes, I'm sometimes questioned by gentlemen that may be passing in the streets while I'm at work, all about our system. They generally say, 'and a very good system, too.' One said once, 'It shows that scavengers can be decent men; they weren't when I was first in London, above 40 years ago.' Well, I sometimes get the price of a pint of beer given to me by gentlemen making inquiries, but very seldom."

Until about eighteen months ago none but unmarried men were employed by the Association, and these all resided in one locality, and under one general superintendence or system. The boarding and lodging of the men has, however, been discontinued about fifteen months; for I am told it was found difficult to encourage industrial and self-reliant pursuits in connection with public eleemosynary aid. Married men are now employed, and all the street-orderlies reside at their own homes; the adults, married or single, receiving 12*s.* a week each; the boys, 6*s.*; while to each man is gratuitously supplied a blouse of blue serge, costing 2*s.* 6*d.*, and a glazed hat, costing the same amount.

The system formerly adopted was as follows:—

The men were formed into a distinct body, and established in houses taken for them in Ham-yard, Great Windmill-street, Haymarket.

"The wages of the men," states the Report, "were fixed at 12*s.* each per week; that is, 9*s.* were charged for board and lodging, and 3*s.* were paid in money to each man on Saturday afternoon, out of which he was expected to pay for his clothing and washing. The men had provided for them clean wholesome beds and bedding, a common sitting-room, with every means of ablution and personal cleanliness, including a warm bath once a week. Their food was abundant and of the best quality, viz., coffee and bread and butter for breakfast, at eight o'clock; round of beef, bread, and vegetables, four times a week for dinner, at one o'clock; nutritious soup and bread, or bread and cheese, forming the afternoon repast of the other three days. At six in the evening, when they returned from their labours, they were refreshed with tea or coffee, and bread and butter; or for supper, at nine, each had a large basin of soup, with bread. Thus, three-fourths of their wages being laid out for them to advantage, the men were well lodged and fed; and they have always declared themselves satisfied, comfortable, and happy, under the arrangements that were made for them. Under the charge of their intelligent and active superintendent, the street-orderlies soon fell into a state of the most exact discipline and order; and when old orderlies were drafted off, either to enter the service of parish boards who adopted the system, or were recommended into service, or some other superior position in life, and when new recruits came to supply their places, the latter found no difficulty in conforming to the rules laid down for the performance of their duties, as well as for their general conduct. 'Military time' regulated their hours of labour, refreshment, and rest; due attention was required from all; and each man (though a scavenger) was expected to be cleanly in his person, and respectful in his demeanour; indeed, nothing could be more gratifying than the conduct of these men, both at home and abroad."

"In their domicile in Ham Yard," continues the Report, "the street-orderlies have invariably been encouraged to follow pursuits which were useful and improving, after their daily labours were at an end; for this, a small library of history, voyages, travels, and instructive and entertaining periodical works, was placed at their disposal; and it is truly gratifying to the Council to be able to state, that the men evinced great satisfaction, and even avidity, in availing themselves of this source of intellectual pleasure and improvement. Writing materials also were provided for them, for the purpose of practice and improvement, as well as for mutual instruction in this most necessary and useful art; and it must be gratifying to the members of the Association to be informed, that, in April last, 34 out of 40 men appended their

signatures, distinctly and well written, to a document which was submitted to them. Such a fact will at least prove, that when poor persons are employed, well fed, and lodged, and cared for in the way of instruction, they do not always mis-spend their time, nor, from mere preference, run riot in pot-houses and scenes of low debauchery. It is to be borne in mind, however, that one-half of these men were persons of almost every trade and occupation, from the artizan to the shopman and clerk, and therefore previously educated; the other half consisted of labourers and persons forsaken and indigent from their birth, and formerly dependent on workhouse charity or chance employment for their scanty subsistence; consequently in a state of utter ignorance as to reading and writing.

"Every night, after supper, prayers were read by the superintendent; and it has frequently been a most edifying as well as gratifying sight to members of your council, as well as to other persons of rank and station in society, who have visited the Hospice in Ham Yard at that interesting hour, to observe the decorum with which these poor men demeaned themselves; and the heartfelt solemnity with which they joined in the invocations and thanks to their Creator and Preserver!

"Each Sunday morning, at 8 o'clock, a portion of the church service was read, followed by an extemporaneous discourse or exhortation by the secretary to the Hospice. They were marshalled to church twice on the Sabbath, headed by the superintendent and foremen; and generally divided into two or three bodies, each taking a direction to St. James's, St. Anne's, or St. Paul's, Covent Garden; in all of which places of worship they had sitting accommodation provided by the kindness of the clergy and churchwardens. On Tuesday evenings they had the benefit of receiving pastoral visits and instruction from several of the worthy clergymen of the surrounding parishes."

This is all very benevolent, but still very wrong. There is but one way of benefiting the poor, viz., by developing their powers of self-reliance, and certainly not in treating them like children. Philanthropists always seek to do too much, and in this is to be found the main cause of their repeated failures. The poor are expected to become angels in an instant, and the consequence is, they are merely made *hypocrites*. Moreover, no men of any independence of character will submit to be washed, and dressed, and fed like schoolboys; hence none but the worst classes come to be experimented upon. It would seem, too, that this overweening disposition to play the part of *ped-agogues* (I use the word in its literal sense) to the poor, proceeds rather from a love of power than from a sincere regard for the people. Let the rich become the advisers and assistants of the poor, giving them the benefit of their superior education and means—but *leaving the people to act for themselves*—and they will do a great good, developing in them a higher standard of comfort and moral excellence, and so, by improving their tastes, inducing a necessary change in their habits. But such as seek merely to *lord it* over those whom distress has placed in their power, and strive to bring about the *villeinage* of benevolence, making the people the philanthropic, instead of the feudal, serfs of our nobles, should be denounced as the arch-enemies of the country. Such persons may mean well, but assuredly they achieve the worst towards the poor. The curfew-bell, whether instituted by benevolence or tyranny, has the same degrading effect on the people—destroying their principle of self-action, without which we are all but as the beasts of the field.

Moreover, the laying out of the earnings of the poor is sure, after a time, to sink into "a job;" and I quote the above passage to show that, despite the kindest management, eleemosynary help is *not* a fitting adjunct to the industrial toil of independent labourers.

The residences of the street-orderlies are now in all quarters where unfurnished rooms are about 1*s.* 9*d.* or 2*s.* a week. The addresses I have cited show them residing in the outskirts and the heart of the metropolis. The following returns, however, will indicate the ages, the previous occupations, the education, church-going, the personal habits, diet, rent, &c., of the class constituting the street-orderlies, better than anything I can say on the matter.

Before any man is employed as a street-orderly, he is called upon to answer certain questions, and the replies from 67 men to these questions supply a fund of curious and important information—important to all but those who account the lot of the poor of *no* importance. In presenting these details, I beg to express my obligations to Mr. Colin Mackenzie, the enlightened and kindly secretary of the Association.

I shall first show what is the order of the questioning, then what were the answers, and I shall afterwards recapitulate, with a few comments, the salient characteristics of the whole.

The questions are after this fashion; the one I adduce having been asked of a scavager to whom a preference was given:—

The Parish of St. Mary, Paddington.—Questions asked of Parish Scavagers, applying for employment as Street-Orderlies, with the answers appended.

Name?—W—— C——.

Age?—35 years.

How long a scavenger?—Three months.

What occupation previously?—Gentleman's footman.

Married or single?—Married.

Reading, writing, or other education?—Yes.

Any children?—One.

Their ages?—Three years.

Wages?—Nine shillings per week.

Any parish relief?—No.

What and how much food the applicants have usually purchased in a week.

Meat?—2*s.* 6*d.*

Bacon?—None.

Fish?—None.

Bread?—2*s.*

Potatoes?—4*d.*

Butter?—6*d.*

Original from HARVARD UNIVERSITY

Tea and sugar?—1*s.*

Cocoa?—None.

What rent they pay?—2*s.*

Furnished or unfurnished lodgings?—Unfurnished.

Any change of dress?—No.

Sunday clothing?—No.

How many shirts?—Two shirts.

Boots and shoes?—One pair.

How much do they lay out for clothes in a year?—I have nothing but what I stand upright in.

Do they go to church or chapel?—Sometimes.

If not, why not?—It is from want of clothes.

Do they ever bathe?—No.

Does the wife go out to, or take in work?—Yes.

What are her earnings?—Uncertain.

Do they have anything from charitable institutions or families?—No.

When ill; where do they resort to?—Hospitals, dispensaries, and the parish doctor.

Do their children go to any school; and what?—Paddington.

Do they ever save any money; how much, and where?—

How much do they spend per week in drink?

Do not passers by, as charitable ladies, &c., give them money; and how much per week?—No.

Such are the questions asked, and I now give the answers of 67 individuals.

Their ages were:—

10 were from 20 to 30	15 from 50 to 60
13 „ 30 „ 40	4 „ 60 „ 70.
24 „ 40 „ 50	1 „ 70

The greatest number of any age was 7 persons of 45 years respectively.

Their previous occupations had been:—

22 labourers.	1 sweep.
3 at the business "all their lives."	1 haybinder.
3 dustmen.	1 gaslighter.
3 ostlers.	1 dairyman.
2 stablemen.	1 ploughman.
2 carmen.	1 gardener.
2 porters.	1 errand boy.
2 gentlemen's servants.	1 fur dresser.
2 greengrocers.	1 fur dyer.
1 following dust-cart.	1 skinner.
1 excavator.	1 leather dresser.
1 gravel digging.	1 letter-press printer.
1 stone breaking in yards.	1 paper stainer.
1 at work in the brick-fields.	1 glass blower.
1 at work in the lime-works.	1 farrier.
1 coal porter.	1 plasterer.
	1 clerk.
	1 vendor of goods.
	1 licensed victualler.

Therefore, of 67 scavagers
12 had been artizans.
55 „ unskilled workmen.

Hence about five-sixths belong to the unskilled class of operatives.

Time of having been at scavagering.

3 "all their lives" at the business.	4 from 5 to 10 years.
1 about 27 years.	34 „ 1 „ 5 „
6 from 15 to 20 years.	13 twelve months and less.
6 „ 10 „ 15 „	

Hence it would appear, that few have been at the business a long time. The greater number have not been acting as scavagers more than five years.

State of education.—Could they read and write?

45 answered yes.	5 could read only.
4 replied that they could read and write.	12 could do neither.
	1 was deaf and dumb.

Hence it would appear, that rather more than two-thirds of the scavagers have received *some little* education.

Did they go to church or chapel?

22 answered yes.	1 not often.
9 went to church.	17 never went at all.
4 „ chapel.	1 was ashamed to go.
4 „ the Catholic chapel.	1 went out of town to enjoy himself.
1 „ both church and chapel.	2 made no return (1 being deaf and dumb).
5 went sometimes.	

Thus it would seem, that not quite two-thirds regularly attend some place of worship; that about one-eleventh go occasionally; and that about one-fourth never go at all.

Why did they not go to church?

12 had no clothes.
55 returned no answer (1 being deaf and dumb).

Hence of those who never go (19 out of 67), very nearly two-thirds (say 12 in 19) have no clothes to appear in.

Did they bathe?

59 answered no.	Thames.
3 replied yes.	2 returned "sometimes."
2 said they did in the	1 was deaf and dumb.

Hence it appeared, that about seven-eighths never bathe, although following the filthiest occupation.

Were they married or single?

56 were married.	6 were single.
5 „ widowers.	

Thus it would seem, that about ten-elevenths are or have been married men.

How many children had they?

1 had 15.	6 had 1 each.
1 „ 6.	16 „ none (6 of these being single men).
2 „ 5 each.	2 returned their family as grown up without stating the number.
11 „ 4 „	
19 „ 3 „	
9 „ 2 „	

Consequently 51 out of 61, or five-sixths, are married, and have families numbering altogether 165 children; the majority had only 3 children, and this was about the average family.

Original from HARVARD UNIVERSITY

What were the ages of their children?

11 were grown up.
2 between 30 and 40.
9 " 20 and 30.
49 " 10 and 20.
80 " 1 and 10.
8 were 1 year and under.
5 were returned at home.
1 returned as dead.

One-half of the scavagers' children, therefore, are between 1 and 10 years of age; the majority would appear to be 8 years old.

Some were said to be grown up, but no number was given.

Did their children go to school?

13 answered yes.
13 to the National School
5 to the Ragged School.
2 to Catholic.
2 to Parish.
6 to local schools.
1 replied that he went sometimes.
2 returned no.
1 replied that his children were "not with him."
22 (of whom 16 had no children, and 1 was deaf and dumb) made no reply.

From this it would seem, that a large majority—41 out of 51, or four-fifths—of the parents who have children send them to school.

Did their wives work?

15 returned no.
6 said their wives were "unable."
1 had lost the use of her limbs.
2 did, but "not often."
4 did "when they could."
10 worked "sometimes."
12 answered yes.
1 sold cresses.
15 made no return (11 having no wives and 1 being deaf and dumb).

Hence two-fifths of the wives (22 out of 56) do no work, 16 do so occasionally, and 13, or one-fourth, are in the habit of working.

What were wives' earnings?

10 returned them as "uncertain."
1 "didn't know."
1 estimated them at 1*s.* 6*d.* per week.
1 at 1*s.* to 2*s.* "
2 at 2*s.* "
3 at 2*s.* or 3*s.* "
2 at about 3*s.* "
1 at 2*s.* to 4*s.* per week.
1 at 3*s.* or 4*s.* "
1 at 3*d.* or 4*d.* per day.
43 gave no returns (having either no wives, or their wives not working).
1 was deaf and dumb.

So that, out of 29 wives who were said to work, 16 occasionally and 13 regularly, there were returns for 23. Nearly half of their earnings were given as uncertain from their seldom doing work, while the remainder were stated to gain from 1*s.* to 4*s.* per week; about 2*s.* 6*d.* perhaps would be a fair average.

What wages were they themselves in the habit of receiving?

3 had 16*s.* 6*d.* per week.
2 " 16*s.* "
28 " 15*s.* "
3 " 14*s.* 6*d.* "
1 " 14*s.* "
2 " 12*s.* "
15 had 9*s.* per week.
4 " 8*s.* "
5 " 7*s.* "
4 " 1*s.* 1½*d.* a day and 2 loaves.

Hence it is evident, that one-half receive 15*s.* or more a week, and about a fourth 9*s.*

It was not the parishes, however, but the contractors with the parishes, who paid the higher rates of wages: Mr. Dodd, for St. Luke's; Mr. Westley, for St. Botolph's, Bishopsgate; Mr. Parsons, for Whitechapel; Mr. Newman, for Bethnal-green, &c.

These wages the scavagers laid out in the following manner:—

For rent, per week.

1 paid 4*s.*
1 " 3*s.* 6*d.*
8 " 3*s.*
14 " 2*s.* 6*d.*
33 " 2*s.*
4 " 1*s.* 6*d.*
1 paid 1*s.* 3*d.*
2 " 1*s.*
1 lived rent free.
1 paid for board and lodging.
1 lived with mother.

Hence it would appear, that near upon half the number paid 2*s.* rent. The usual rent paid seems to be between 2*s.* and 3*s.*, five-sixths of the entire number paying one or other of those amounts. Only three lived in furnished lodgings, and the rents of these were, respectively, two at 2*s.* 6*d.* and the other at 2*s.*

For bread, per week.

1 expended 5*s.* 3*d.*
1 " 5*s.*
1 " 4*s.* 7*d.*
1 " 4*s.* 6*d.*
1 " 4*s.* 3*d.*
7 " 4*s.*
13 " 3*s.* 6*d.*
8 " 3*s.*
3 " 2*s.* 6*d.*
4 " 2*s.* 3*d.*
13 " 2*s.*
4 expended 1*s.* 6*d.*
1 " 1*s.* 9*d.*
4 two loaves a day from parish.
3 gave a certain sum per week to their wives or mothers to lay out for them, and 1 boarded and lodged.
1 was deaf and dumb.

Thus it would seem, that the general sum expended weekly on bread varies between 2*s.* and 4*s.* The average saving from free-trade, therefore, would be between 4*d.* and 8*d.*, or say 6*d.*, per week.

For meat, per week.

4 expended 4*s.*
5 " 3*s.* 6*d.*
11 " 3*s.*
12 " 2*s.* 6*d.*
1 " 2*s.* 4*d.*
5 " 2*s.*
4 " 1*s.* 6*d.*
1 " 1*s.* 2*d.*
9 " 1*s.*
2 " 10*d.*
2 " 6*d.*
1 expended 8*d.*
1 once a week.
4 had none.
5 no returns (3 of this number gave a weekly allowance to wives or mothers, 1 was deaf and dumb, and 1 paid for board and lodging).

By the above we see, that the sum usually expended on meat is between 2*s.* 6*d.* and 3*s.* per week, about one-third of the entire number expending that sum. All those who expended 1*s.* and less per week had 9*s.* and less for their week's labour. The average saving from the cheapening of provisions would here appear to be between 5*d.* and 6*d.* per week at the outside.

For tea and sugar, per week.

2 paid 2*s.* 6*d.*
1 " 2*s.* 4*d.*
1 " 2*s.* 3*d.*
19 " 2*s.*
2 " 1*s.* 9*d.*
4 " 1*s.* 8*d.*
12 " 1*s.* 6*d.*
5 " 1*s.* 4*d.*
5 paid 1*s.* 3*d.*
5 " 1*s.* 2*d.*
13 " 1*s.*
2 " 8*d.*
5 no returns: 1 deaf and dumb, 1 board and lodging, and 3 making allowances.

The sum usually expended on tea and sugar seems to be between 1*s.* 6*d.* and 2*s.* per week.

Original from HARVARD UNIVERSITY

For fish, per week.

3 expended 1*s*.
5 „ 8*d*.
23 „ 6*d*.
8 „ 4*d*.
28 „ nothing.
4 allowed so much per week to wives, or mother, or landlady.
1 deaf and dumb.

Hence one-third spent 6*d*. weekly in fish, and one-third nothing.

For bacon, per week.

1 expended 1*s*.
2 „ 10*d*.
1 „ 9*d*.
5 „ 8*d*.
9 „ 6*d*.
1 expended 4*d*.
43 „ nothing.
4 allowances to wives, &c.
1 deaf and dumb.

The majority (two-thirds), therefore, do not have bacon. Of those that do eat bacon, the usual sum spent weekly is 6*d*. or 8*d*.

For butter, per week.

1 expended 1*s*. 8*d*.
24 „ 1*s*.
11 „ 10*d*.
12 „ 8*d*.
11 „ 6*d*.
1 expended 3*d*.
2 „ nothing.
4 made allowances.
1 deaf and dumb.

Thus one-third expended 1*s*., and about one-sixth spent 10*d*.; another sixth, 8*d*.; and another sixth, 6*d*. a week, for butter.

For potatoes, per week.

1 spent 1*s*.
2 „ 10*d*.
6 „ 8*d*.
1 „ 7*d*.
18 „ 6*d*.
6 spent 4*d*.
28 spent nothing.
4 made allowances.
1 deaf and dumb.

About one-fourth spent 6*d*.; the greater proportion, however (nearly one-half), expended nothing upon potatoes weekly.

For clothes, yearly.

2 expended 2*l*.
2 „ 1*l*. 10*s*.
2 „ 1*l*. 5*s*.
3 „ 1*l*.
1 „ 18*s*.
1 „ 17*s*.
1 „ 15*s*.
4 „ 12*s*.
1 „ 10*s*.
34 couldn't say.
1 had 2 pairs of boots a year, but no clothes.
2 expended "not much."
2 got them as they could.
1 expended a few shillings.
1 said it "all depends."
2 returned "nothing."
1 was deaf and dumb.
6 made no return.

Hence 43 out of 67, or nearly two-thirds, spent little or nothing upon their clothes.

Had they a change of dress?

28 had a change of dress.
38 had not.
1 was deaf and dumb.

Above one-half, therefore, had no other clothes but those they worked in.

Had they any Sunday clothing?

20 had some.
45 had none.
21 made no return.
1 deaf and dumb.

More than two-thirds, then, had no Sunday clothes.

How many shirts had they?

10 had 3 shirts.
54 „ 2 „
2 had 1 shirt.
1 was deaf and dumb.

The greater number, therefore, had two shirts.

How many shoes had they?

27 had 2 pairs.
39 „ 1 „
1 was deaf and dumb.

Thus the majority had only one pair of shoes.

How much did they spend in drink?

1 expended 2*s*. a week.
1 „ 1*s*. or 2*s*. „
2 „ 1*s*. 6*d*. „
4 „ 1*s*. „
1 „ 6*d*. „
1 „ 3*d*. or 5*d*. „
7 said they "couldn't say."
1 said he "wouldn't say."
1 said "that all depends."
2 said they "had none to spend."
2 expended nothing.
44 gave no return (1 deaf and dumb).

Hence answers were given by one-third, of whom the greatest number "couldn't say." (?) Of the ten who acknowledged spending anything upon drink, the greater number, or 4, said they spent 1*s*. a week only. But?

Did they save any money?

36 answered no.
31 gave no reply (1 being deaf and dumb).

What did they in case of illness coming upon themselves or families?

28 went to the dispensary
8 went to the hospital.
6 „ parish doctor.
3 wives went to the lying-in hospital.
1 went to the workhouse.
2 said "nothing."
1 "never troubled any."
8 made no reply (1 being deaf and dumb).

The greater number, then, go, when ill, to the dispensary.

Were they in receipt of alms?

56 answered no.
2 „ sometimes.
3 „ yes.
6 made no returns (1 being deaf and dumb).

Did the passers-by give them anything?

49 answered no.
2 „ sometimes beer.
1 answered never.
2 „ seldom.
1 answered very seldom.
12 no returns (1 being deaf and dumb).

Did they receive any relief from their parishes?

56 replied no.
4 had 2 loaves and 1*s*. a day as wages.
1 had 4 loaves a week.
1 „ a 4-lbs. loaf.
1 had 15 lbs. of bread.
2 answered "not at present."
2 made no returns.

Thus the greater proportion (five-sixths), it will be seen, had no relief; two of those who had relief received 9*s*. wages a week, and two others only 7*s*., while four received part of their wages from the parish in bread.

These analyses are not merely the characteristics of the applicant or existent street-orderlies; they are really the annals of the poor in all that relates to their domestic management in regard to meat and clothes, the care of their children, their church-going, education, previous callings, and parish relief. The inquiry is not discouraging as to the character of the poor, and I must call attention to the circumstance of how rarely it is

Original from HARVARD UNIVERSITY

that so large a collection of facts is placed at the command of a public writer. In many of the public offices the simplest information is as jealously withheld as if statistical knowledge were the first and last steps to high treason. I trust that Mr. Cochrane's example in the skilful arrangement of the returns connected with the Association over which he presides, and his courteous readiness to supply the information, gained at no small care and cost, will be more freely followed, as such a course unquestionably tends to the public benefit.

It will be seen from these statements, how hard the struggle often is to obtain work in unskilled labour, and, when obtained, how bare the living. Every farthing earned by such workpeople is necessarily expended in the support of a family; and in the foregoing details we have another proof as to the diminution of the purchasing fund of the country, being in direct proportion to the diminution of the wages. If 100 men receive but 7*s.* a week each for their work, their yearly outlay, to "keep the bare life in them," is 1820*l.* If they are paid 16*s.* a week, their outlay is 4160*l.*; an expenditure of 2340*l.* more in the productions of our manufactures, in all textile, metal, or wooden fabrics; in bread, meat, fruit, or vegetables; and in the now necessaries, the grand staple of our foreign and colonial trade—tea, coffee, cocoa, sugar, rice, and tobacco. *Increase your wages, therefore, and you increase your markets.* For manufacturers to underpay their workmen is to cripple the demand for manufactures. To talk of the over-production of our cotton, linen, and woollen goods is idle, when thousands of men engaged in such productions are in rags. It is not that there are too many makers, but too few who, owing to the decrease of wages, are able to be buyers. Let it be remembered that, out of 67 labouring men, three-fourths could not afford to buy proper clothing, expending thereupon "little" or "nothing," and, I may add, *because* earning little or nothing, and so having scarcely anything to expend.

I now come to *the cost of cleansing the streets upon the street-orderly system*, as compared with that of the ordinary modes of payment to contractors, &c. It will have been observed, from what has been previously stated, that the Council of the Association contend that far higher amounts may be realized for street manure when collected clean, according to the street-orderly plan. If, by a better mode of collecting the street dirt, it be kept unmixed, its increase in value and in price may be most positively affirmed.

Before presenting estimates and calculations of cost, I may remind the reader; that under the street-orderly system no watering carts are required, and none are used where the system is carried out in its integrity. To be able to dispense with the watering of the streets is not merely to get rid of a great nuisance, but to effect a considerable saving in the rates.

I now give two estimates, both relating to the same district:—

Comparative Expense of Cleaning and Watering the Streets, &c., of St. James's Parish; under the system now in operation by the Paving Board, and under the sanitary system of employing street-orderlies, as recommended by 779 ratepayers. It is assumed, from reasonable data, that the superficial contents of all the streets, lanes, courts, and alleys in the parish, do not amount to more than 80,000 square yards.

"*Present Annual Expense of Cleansing St. James's Parish:—*

	£	s.	d.
Paid to contractor for carrying away slop, including expense of brooms	£800	0	0
Paid to 23 men, average wages, 10*s.* per week, 52 weeks	598	0	0
	£1398	0	0

"*Annual Expense of Street-Orderly System:—*

	£	s.	d.	£	s.	d.
30 men (including those with hand-barrows), at 10*s.* per week, 52 weeks	£780	0	0			
Expense of brooms	30	0	0			
Cartage of slop	100	0	0			
				£910	0	0
				£488	0	0
Saving by diminished expense of street-watering throughout the parish				450	0	0
Annual prospective saving				£930	0	0

"Obs.—The sum of 800*l.* per annum was paid to the contractor on account of expenses incurred for the removal of slop. During the three years previous to 1849, the contractor paid money to the parish for permission to remove the house-ashes, the value of which was then 2*s.* per load; it is now 2*s.* 6*d.* In St. Giles's and St. George's parishes, whose surface is more than twice the extent of St. James's, the expense of slop-cartage, in 1850, was 304*l.* 14*s.* 0*d.*, whilst the sum received for cattle-manure collected by street-orderlies, was 73*l.* 14*s.* 0*d.*; and the slop-expenses for the four months ending November 29, were 59*l.* 18*s.* 6*d.*, whilst the manure sold for 21*l.* 6*s.* 0*d.* Thus has the slop-expense in these extensive united parishes been reduced to less than 120*l.* per annum. Since the preceding estimate was submitted to the Commissioners of Paving, the street-orderly system has been introduced into St. James's parish; and it is confidently expected that the 'Annual Prospective saving' of 938*l.*, will be fully realised."

A similar estimate has just been sent into the authorities of the great parish of St. Marylebone, but its results do not differ from the one I have just cited.

I next present an estimate contrasting the expense of the street-orderly method with the cost of employing sweeping-machines:—

"Comparative Expense of Cleansing and Watering the Streets, &c., of St. Martin's Parish, under the system now in operation by the Paving Board, and under the sanatory system of employing street-orderlies, as recommended by 703 ratepayers. It is assumed, from reasonable data, that the superficial contents of all the streets, lanes, courts, and alleys in the parish, amount to about 70,000 square yards.

"*Expenses by Machinery in St. Martin's Parish.*

	£	s.	d
Annual payment to street-machine proprietor..........	980	0	0
Watering rate (1847)	644	16	8½
Salaries to clerks	391	0	0
Support of 28 able-bodied men in workhouse, thrown out of work, at 4*s*. 6*d*. per man	327	12	0
	£2343	8	8½

"*Expenditure by the Employment of Street-Orderlies.*

	£	s.	d.
Maintenance of 28 street-orderlies to keep clean 70,000 yards (presumed contents), at 2500 yards each man, at 12*s*. per week	768	0	0
Two inspectors of orderlies, at 15*s*. per week........	78	0	0
One superintendent of ditto, at 1*l*. per week....	52	0	0
Wear and tear of brooms ..	36	8	0
Interest on outlay for barrows, brooms, and shovels..	26	19	0
Watering rate (not required)	..	..	..
Value of manure pays for cartage......	..	..	..
	961	7	0
Annual saving by street-orderlies......	1382	1	8½
	2343	8	8½

I now give an estimate concerning a smaller district, *one of the divisions of St. Pancras parish.* It was embodied in a Report read at a meeting in Camden-town, on the desirableness of introducing the street-orderly system:—

The Report set forth that the Committee had "made a minute investigation into the present systems of street-cleansing, as adopted under the superintendence of Mr. Bird, the parish surveyor, and under that of the National Philanthropic Association.

"From the 26th of March, 1848, to the 26th of March, 1849, the *Directors of the Poor expended in paving and cleansing, &c., the three and a quarter miles under their charge*, 3545*l*. 19*s*. 7*d*.; of this the following items were for cleansing, viz.—

	£	s.	d.
Labour	249	13	0
Tools	10	12	0
Slop carting....	496	0	0
Proportion of foreman's salary..........	39	0	0
	795	5	0

"*The street-orderly system of cleansing* the said roads in the most efficient manner would give the following expenditure per annum:—

	£	s.	d.
Thirty-four men to cleanse 3¼ miles, at the rate of 2000 superficial yards each man, 12*s*. per week each	1060	16	0
Two inspectors of orderlies, at 15*s*. per week each..........	78	0	0
Superintendent	104	0	0
Cost of brooms, shovels, &c...	83	0	0
No allowance for slop-carting, the National Philanthropic Association holding that the manure, properly collected, will more than pay for its removal	..	..	..
	1325	16	0
Deduct cost of cleansing by the old mode	795	5	0
	530	11	0

"The apparent extra cost, therefore, would be 530*l*. 11*s*. The vestry, however, would see that the charge for supporting 34 able-bodied men in the workhouse is at least 5*s*. per week each, or 442*l*. per annum. This, therefore, must be deducted from the 530*l*. 11*s*., leaving the extra cost 88*l*. 11*s*. per annum. This sum, the committee were assured, will be not only repaid by the reduced outlay for repairs, which the new system will effect; but a very great saving will be the result of the thorough cleansed state in which the roads will be constantly maintained. Under the late system, to find the roads in a cleansed state was the exception, not the rule; and when all the advantages likely to result from the new system were taken into consideration, the committee did not hesitate to recommend it for adoption in its most efficient form."

Concerning the *expense of cleansing the City by the street-orderly system*, Mr. Cochrane says:—

"The number required for the whole surface (including the footways, courts, &c.) would be about 250 men and boys.

"Upon the present system this number would be formed in three divisions:—

"First division.—170 to begin work at 6 a.m., and end 6 p.m. Second division, called relief and aids.—30 boys boys from 12 at noon to 10. Third division.—50 men from 6 p.m. to 6 a.m. Total, 250.

"The men and boys are now working at from 6*s*. to 12*s*. per week.

These 250 men and boys would cost for wages during the year about........	£5100
Twelve foremen, at 40*l*. per annum....	480
Two superintendents at 50*l*. each........	100
Brooms, &c........	325
Barrows............	100
Two clerks, at 100*l*. each..............	200
Manager...........	100
	£6405

"No items are given for slopping or cartage, as, if the streets are properly attended to, there ought to be no slop, whilst the value of the manure may be more than equivalent for the expense of its removal.

"Some slop-carts will, however, be occasionally required for Smithfield-market and similar localities; making, therefore, ample allowance for contingencies, it is confidently considered that the expense for cleansing the whole of the city of London by street-orderlies would not exceed 8000*l*. per annum."

"*Expenses of Cleansing and Watering the Streets, &c., of the City of London, on the old system of Scavaging, from June, 1845, to June,* 1846.

	Annual Expense.
To scavaging contractors	£6040
Value of ashes and dust of the city of London, given gratis to the above contractors in the year ending 1846, and now purchased by them for the year ending 1847	5500
Estimated contributions levied for watering streets..........	4000
Salaries to surveyors, inspectors, beadles, clerks, &c., of Sewers' Office, according to printed account, March 3, 1846............	2485
Expense for cleaning out sewers and gully-holes (not known)	
Annual expense under the imperfect system of street-cleansing.	£18,025

"Number of men employed, 58.

"State of the Streets:—Inhabitants always complaining of their being muddy in winter and dusty in summer."

Two estimates, then, show an expectation of a yearly saving of no less than 2320*l*. to the rate-payers of two parishes alone; 938*l*. to St. James's, and 1382*l*. to St. Martin's. And this, too, if all that be augured of this system be realized, with a freedom from street dust and dirt unknown under other methods of scavagery. I think it right,

Original from HARVARD UNIVERSITY

however, to express my opinion that even in the reasonable prospect of these great savings being effected, it is a paltry, or rather a false, because miscalled, economy to speculate on the payment of 10*s.* and 12*s.* a week to street-labourers in the parishes of St. James and St. Martin respectively, when so many of the contractors pay their men 16*s.* weekly. If this low hire be justifiable in the way of an experiment, it can never be justifiable as a continuance of the *reward* of labour.

If the street-orderly system is to be the means of *permanently* reducing the wages of the regular scavagers from 16*s.* to 12*s.* a week, then we had better remain afflicted with the physical dirt of our streets, than the moral filth which is sure to proceed from the poverty of our people—but if it is to be a means of elevating the pauper to the dignity of the independent labour, rather than dragging the independent labourer down to the debasement of the pauper, then let all who wish well to their fellows encourage it as heartily and strenuously as they can—otherwise the sooner it is denounced as an insidious mode of defrauding the poor of one-fourth of their earnings the better; and it is merely in the belief that Mr. Cochrane and the Council of the Association *mean* to keep faith with the public and increase the men's wages to those of the regular trade, that the street-orderly system is advocated here. If our philanthropists are to reduce wages 25 per cent., then, indeed, the poor man may cry, "*save me from my friends.*"

As to the positive and definite working of the street-orderly system as an *economical* system, no information can be given beyond the estimates I have cited, as it has never been duly tested on a sufficiently large scale. Its working has been, of necessity, desultory. It has, however, been introduced into St. George's, Bloomsbury; St. James's, Westminster; and is about to be established in St. Martin's-in-the-Fields; and in the course of a year or two it seems that it will be sufficiently tested. That its working has hitherto been desultory is a necessity in London, where "vested interests" look grimly on any change or even any inquiry. That it deserves a full and liberal testing seems undeniable, from the concurrent assent of all parishioners who have turned their attention to it.

It remains to show the expenses of the Philanthropic Association, for I am unable to present an account of street-orderlyism separately. The two following tables fully indicate to what an extent the association is indebted to the private purse of Mr. Cochrane, who by this time has advanced between 6000*l.* and 7000*l.*

"BALANCE SHEET.

Receipts and Expenditure of the National Philanthropic Association, for the Promotion of Social and Sanatory Improvements and the Employment of the Poor, from 29th September, 1846, to 29th September, 1849.

Street-Orderlies.—City Surveyor's Report.

I have been favoured with a Report "upon street-cleansing and in reference to the Street-Orderly System," by the author, Mr. W. Haywood, the Surveyor to the City Commission of Sewers, who has invited my attention to the matter, in consequence of the statements which have appeared on the subject in "London Labour and the London Poor."

Mr. Haywood, whose tone of argument is courteous and moderate, and who does not scruple to do justice to what he accounts the good points of the street-orderly system, although he condemns it as a whole, gives an account of the earlier scavaging of the city, not differing in any material respect from that which I have already printed. He represents the public ways of the City, which I have stated to be about 50 miles, as "about 51 miles lineal, about 770,157 superficial yards in area." This area, it appears, comprehends 1000 different places.

In 1845 the area of the carriage-way of the City was estimated at 418,000 square yards, and the footway at 316,000, making a total of 734,000; but since that period new streets have been made and others extensively widened. The precincts of Bridewell, St. Bartholomew, St. James's, Duke's-place, Aldgate, and others, have been added to the jurisdiction of the Sewers Commission by Act of Parliament, so that the Surveyor now estimates the area of the carriage-way of the City of London at 441,250 square yards, and the footway at 328,907, making a total of 770,157 square yards.

"I am fully impressed," observes Mr. Haywood, "with the great importance to a densely-populated city of an efficient cleansing of the public ways. Probably after a perfect system of sewage and drainage (which implies an adequate water supply), and a well-paved surface (which I have always considered to be little inferior in its importance to the former, and which is indispensable to obtaining clean sweeping), good surface cleansing ranks next in its beneficial sanitary influence; and most certainly the comfort gained by all through having public thoroughfares in a high degree of cleanliness is exceedingly great."

Mr. Haywood expresses his opinion that streets "ordure soddened"—smelling like "stable yards,"—dangerous to the health of the inhabitants—impassable from mud in winter and from dust in summer—and inflicting constant pecuniary loss, "can only exist in an appreciable degree in thoroughfares swept much less frequently" than the streets within the jurisdiction of the City Commissioners of Sewers. In this opinion, however, Mr. Haywood comes into direct collision with the statements put forth by the Board of Health, who have insisted upon the insanitary state of the metropolitan streets, more strongly, perhaps, in their several Reports, than has Mr. Cochrane.

But Mr. Haywood believes that not only are the assertions of the Board of Health as to the unwholesome state of the metropolitan thoroughfares unfounded as regards the city of London, but he asserts that from the daily street-sweeping, "the surface there is maintained in as high an average condition of cleanliness, as the means hitherto adopted will enable to be attained."

"Nor does this apply," says Mr. Haywood, "to the main thoroughfares only. In the poorer courts and alleys within the city, where a high degree of cleanliness is, at least, as needful, in a sanitary point of view, as in the larger and wider thoroughfares, the facilities for efficient sweeping are as great, if not greater, than in other portions of your jurisdiction. For many years past the whole of the courts and alleys which carts do not enter, have been paved with flagstone, laid at a good inclination, and presenting an uniform smooth *non-absorbent* surface: in many of these courts where the habits of the people are cleanly, the scavenger's broom is almost unneeded for weeks together; in others, where the habit prevails of throwing the refuse of the houses upon the pavements, the daily sweeping is highly essential; but in all these courts the surface presents a condition which renders good clean sweeping a comparatively easy operation, that which is swept away being mostly dry, or nearly so."

After alluding to the street-orderly principle of scavaging, "to clean and keep clean," Mr. Haywood observes, "between the '*street-orderly system*' and the periodical or intermittent sweeping there is this difference, that upon the former system there should be (if it fulfils what it professes) no deposit of any description allowed to remain much longer than a few minutes upon the surface, and that there should be neither mud in the wet weather, nor dust in the dry weather, upon the public ways; whilst, upon the latter system, the deposit necessarily accumulates between the periods of sweeping, commencing as soon as one sweeping has terminated, gradually increasing, and being at its point of extreme accumulation at the period when the next sweeping takes place: the former, then, is, or should be, a system of prevention; the latter, confessedly, but a system of palliation or cure.

"The more frequent the periodical sweeping, therefore, the nearer it approximates in its results to the '*street-orderly system*,' inasmuch as the accumulations, being frequently removed, must be smaller, and the evils of mud, dust, effluvia, &c., less in proportion.

"Now to fulfil its promise: upon the 'street-orderly system,' there should be men both day and night within the streets, who should constantly remove the manure and refuse, and, failing this, if there be only cessation for six hours out of the twenty-four of the 'continuous cleansing,' it becomes at once a periodical cleansing but a degree in advance of the daily sweeping, which has been now for years in operation within the city of London."

This appears to me to be an extreme conclusion:—because the labours of the street-orderly system cease when the great traffic ceases, and when, of course, there is comparatively little or no dirt

Original from HARVARD UNIVERSITY

deposited in the thoroughfares, therefore, says Mr. Haywood, "the City system of cleansing once per day is *only a degree* behind that system of which the principle is incessant cleansing at such time as the dirtying is incessant." The two principles are surely as different as light and darkness:—in the one the cleansing is intermittent and the dirt constant; in the other the dirt is intermittent and the cleanliness constant—constant, at least, so long as the causes of impurity are so.

Mr. Haywood, however, states that the Commissioners were so pleased with the appearance of the streets, when cleansed on the street-orderly system, which "was *certainly much to be admired*," that they introduced a somewhat similar system, calling their scavngers "daymen," as they had the care of *keeping* the streets clean, *after* a daily morning sweeping by the contractor's men. They commenced their work at 9 A.M. and ceased at 6 P.M. in the summer months, and at half-past 4 P.M. in the winter. In the summer months 36 daymen were employed on the average; in the winter months, 46. The highest number of scavaging daymen employed on any one day was 63; the lowest was 34. The area cleansed was about 47,000 yards (superficial measure), and with the following results, and the following cost, from June 24, 1846, to the same date, 1847:—

	Yards Superficial.
The average area cleansed during the summer months, per man per diem, was	1298
Ditto during winter, per man per diem, was	1016
The average of both summer and winter months was, per man per diem	1139

The cost of the experiment was for daymen (including brooms, barrows, shovels, cartage, &c.* .	£1450	18
One Foreman at	78	0
And the total cost of the experiment .	£1528	18

"The daily sweeping," Mr. Haywood says, "which for the previous two years had been established throughout the City, gave at that time *very great satisfaction*. It was quite true that the streets which the daymen attended to, *looked superior* to those cleansed only *periodically*, but the practical value of the difference was considered by many not to be worth the sum of money paid for it. It was also felt that, if it was continued, it should upon principle be extended at least to all streets of similar traffic to those upon which it had been tried; and as, after due consideration, the Commission thought that one daily sweeping was sufficient, both for health and comfort, the day or continuous sweeping was abandoned, and the whole City only received, from that time to the present, the usual daily sweeping."

The "present" time is shown by the date of Mr. Haywood's Report, October 13, 1851. The reason assigned for the abandonment of the system of the daymen is peculiar and characteristic. The system of continuous cleansing gave very great satisfaction, although it was but a degree in advance of the once-a-day cleansing. The streets which the daymen attended to "looked," and of course were, "superior" in cleanliness to those scavaged periodically. It was also felt that the principle should "be extended at least to all streets of similar traffic;" and why was it not so extended? Because, in a word, "it was not worth the money;" though by what standard the value of public cleanliness was calculated, is not mentioned.

* The wages paid are not stated.

The main question, therefore, is, what is the difference in the cost of the two systems, and *is* the admitted "superior cleanliness" produced by the continuous mode of scavaging, in comparison with that obtained by the intermittent mode, of sufficient public value to warrant the increased expense (if any)—in a word, as the City people say—is it *worth the money?*

First, as to the comparative cost of the two systems: after a statement of the contracts for the dusting and cleansing of the City (matters I have before treated of) Mr. Haywood, for the purpose of making a comparison of the present City system of scavaging with the street-orderly system, gives the table in the opposite page to show the cost of street cleansing and dusting within the jurisdiction of the City Court of Sewers.

Mr. Haywood then invites attention to the subjoined statement of the National Philanthropic Association, on the occurrence of a demonstration as to the efficiency and economy of the street-orderly system.

"Association for the Promotion of Street Paving, Cleansing, Draining, &c., 20, Vere Street, Oxford Street, January 26th, 1846.

"Approximation to the total Expenses connected with cleansing, as an experiment, certain parts of the City of London, commencing December, 1845, for the period of two months.

	£.	s.	d.
"350 brooms, being an average of 5 brooms for each man	25	18	10
For carting	99	1	9
For advertising	65	0	0
For rent of store-room, 3*l*. 14*s*.; Clerks' salaries, 12*l*.; Messengers, 5*l*. 5*s*.; wooden clogs for men, 2*l*. 5*s*. 10*d*.; expenses of washing wood pavement, 5*l*.	28	4	10
Expenses of barrows	24	14	0
Christmas dinner to men, foremen, and superintendents (97)	15	12	6
83 men (averaging at 2*s*. 6*d*. per day) for 9 weeks	573	15	0
4 superintendents at 25*s*. 4*d*., foreman at 18*s*., cart foreman 20*s*., storekeeper 18*s*., chief superintendents 2*l*., for 9 weeks ..	112	10	0
For various small articles, brushes, rakes, &c.	36	7	8
Petty expenses of the office, postages, &c., and stationery	6	0	0
Approximation to the total cost of the expense	£987	4	7

Signed, M. DAVIES, Secretary."

"I will now," says Mr. Haywood, "without further present reference to the Report of the Association, proceed to form an estimate of the expenses of the system as they would have been if it had been extended to the whole City, and which estimate will be based upon the informa-

NOTE.—From 24th June, 1846, to 24th June, 1847, the Commission made their own experiment upon the Street-Orderly System—the expenses of such experiment are included in the above amounts. In 1849 the area of the jurisdiction of the Commission was increased by the addition of various precincts under the City of London Sewers' Act.

tion as to the expenses of the system, furnished by the experiment or demonstration made by the Association within your jurisdiction.

"The total cost of the experiment was £987 4*s.* 7*d.*, and, deducting the charges under the head of advertising, Christmas dinner, and petty cash expenses, and also that for office-rent, clerks, messengers, &c., and assigning £50 as the value of the implements at that time for future use, there is left a balance of £822 7*s.* 3*d.* as the clear cost of the experiment.

"The experiment was tried for a period of eight weeks exactly, according to the return made to the Commission by the Superintendent of the Association, but as in the statement of expenses the wages appear to be included for a period of nine weeks, I have assumed nine weeks as the correct figure, and the experiment must therefore have cost a sum of £822 7*s.* 3*d.* for that period, or at the rate of about £91 per week.

	Squ. Yards
"Now the total area of the carriage-way of the City of London was at that time	418,000
"And the area of the foot-way . .	316,000
"Making a total of	734,000
"And the area of the carriage-way cleaned by the street-orderlies was	30,670
"And the area of the foot-way . .	18,590
"Making a total of	49,260

"The total area of foot-way and carriage-way cleansed was therefore 1-15th of the whole of the carriage-way and foot-way of the City; or, taken separately, the carriage-way cleansed was somewhat more than 1-14th of the whole of the City carriage-way.

"It has been seen also that the total cost of cleansing this 1-14th portion of the carriage-way, after deducting all extraneous expenses, was at the rate per week of £91
Or at the rate, per annum, of £4732

"To assign an expenditure in the same proportion for the remaining 13-14ths of the whole carriage-way area of the City would not be just, for, in the first place, allowance must be made, owing to the dirt brought off from the adjacent streets, which, it is assumed, would not have been the case had they also been cleansed upon the street-orderly system; and moreover, as the majority of the streets cleansed were those of large traffic, a larger proportion of labour was needed to them than would have been the case had the experiment been upon any equal area of carriage-way, taken from a district comprehending streets of all sizes and degrees of traffic; but if I assume that the 1-14th portion of the City cleansed represents 1-11th of the whole in the labour needed for cleansing the whole of the City upon the same system, I believe I shall have made a very fair deduction, and shall, if anything, err in favour of the experiment.

"Estimating, therefore, the expense of cleansing the whole of the City carriage-way upon the street-orderly system according to the expenses of the experiment made in 1845-6, and from the data then furnished, it appears that cleansing upon such system would have come to an annual sum of 52,052*l.*

"It will be seen that there is a remarkable difference between this estimate of 52,052*l.* per annum and that of 18,000*l.* per annum estimated by the Association, and given in their Report of the 26th January, 1846; and what is more remarkable is, that my estimate is framed not upon any assumption of my own, but is a dry calculation based upon the very figures of expense furnished by the Association itself, and hereinbefore recited."

A second demonstration, carried on in the City by the street-orderlies, is detailed by Mr. Haywood, but as he draws the same conclusions from it, there is no necessity to do other than allude to it here.

According to the above estimate, it certainly must be admitted that the difference between the two accounts is, as Mr. Haywood says, "remarkable"—the one being nearly three times more than the other. But let us, for fairness' sake, test the cost of cleansing the City thoroughfares upon the continuous plan of scavaging by the figures given in Mr. Haywood's own report, and see whether the above conclusion is warranted by the facts there stated. From June, 1846, to June, 1847, we have seen that several of the main streets in the City were cleansed continuously throughout the day by what were called "daymen"—that is to say, 47,000 superficial yards of the principal thoroughfares were *kept* clean (*after* the daily cleansing of them by the contractor's men) by a body of men similar in their mode of operation to the street-orderlies, and who removed all the dirt as soon as deposited between the hours of the principal traffic. The cost of this experiment (for such it seems to have been) was, for the twelve months, as we have seen, 1528*l.* 18*s.* Now if the expense of cleansing 47,000 superficial yards upon the continuous method was 1529*l.*, then, according to Cocker, 770,157 yards (the total area of the public ways of the City) would cost 25,054*l.*; and, adding to this 6328*l.* for the sum paid to the contractors for the daily scavaging, we have only 31,382*l.* for the gross expense of cleansing the whole of the City thoroughfares once a day by the "regular scavagers," and *keeping* them clean *afterwards* by a body similar to the street-orderlies—a difference of upwards of 20,000*l.* between the facts and figures of the City Surveyor.

It would appear to me, therefore, that Mr. Haywood has erred, in estimating the probable expense of the street-orderly system of scavaging applied to the City at 52,000*l.* per annum, for, by his own showing, it actually cost the authorities for the one year when it was tried there, only 1529*l.* for 47,000 superficial yards, at which rate 770,000 yards could not cost more than 31,500*l.*, and this, even allowing that the same amount of labour would be required for the continuous cleansing of the minor thoroughfares as was needed for the principal ones. That the error is an oversight on the part of the City Surveyor, the whole tone of his Report is sufficient to assure us, for it is at once moderate and candid.

It must, on the other hand, be admitted, that Mr. Haywood is perfectly correct as to the difference between the cost of the "demonstration" of the street-orderly system of cleansing in the City, and the estimated cost of that mode of scavaging when brought into regular operation there; this, however, the year's experience of the City "day-men" shows, could not possibly exceed 32,000*l.*, and might and probably would be much less, when we take into account the smaller quantity of labour required for the minor thoroughfares—the extra value of the street manure when collected free from mud—the saving in the expense of watering the streets (this not being required under the orderly system)—and the abolition of the daily scavaging, which is included in the sum above cited, but

Original from HARVARD UNIVERSITY

which would be no longer needed were the orderlies employed, such work being performed by them at the commencement of their day's labours; so that I am disposed to believe, all things considered, that somewhere about 20,000*l*. per annum might be the gross expense of continuously cleansing the City. Mr. Cochrane estimates it at 18,000*l*. But whether the admitted superior cleanliness of the streets, and the employment of an extra number of people, will be held by the citizens to be worth the extra money, it is not for me to say. If, however, the increased cleanliness effected by the street-orderlies is to be brought about by a decrease of the wages of the regular scavagers from 16*s*. to 12*s*. a week, which is the amount upon which Mr. Cochrane forms his estimate, then I do not hesitate to say the City authorities will be gainers, in the matter of poor-rates at least, by an adherence to the present method of scavaging, paying as they do the best wages, and indeed affording an illustrious example to all the metropolitan parishes, in refusing to grant contracts to any master scavagers but such as consent to deal fairly with the men in their employ. And I do hope and trust, for the sake of the working-men, the City Commissioners of Sewers will, should they decide upon having the City cleansed *continuously*, make the same requirement of Mr. Cochrane, before they allow his street-orderlies to displace the regular scavagers at present employed there.

Benefits to the community, gained at the expense of "the people," are really great evils. The street-orderly system is a good one when applied to parishes employing paupers and paying them 1*s*. 1½*d*. and a loaf per day, or even nothing, except their food, for their labour. Here it elevates paupers into independent labourers; but, applied to those localities where the highest wages are paid, and there is the greatest regard shown for the welfare of the workmen, it is merely a scurf-system of degrading the independent labourers to the level of paupers, by reducing the wages of the regular scavagers from 16*s*. to 12*s*. per week. The avowed object of the street-orderly system is to provide employment for able-bodied men, and so to *prevent* them becoming a *burthen to the parish*. But is not a reduction of the scavager's wages to the extent of 25 per cent. a week, more likely to *encourage* than to *prevent* such a result? This is the weak point of the orderly system, and one which gentlemen calling themselves *philanthropists* should really blush to be parties to.

After all, the opinion to which I am led is this—the street-orderly system is incomparably the best mode of scavaging, and the payment of the men by "*honourable*" masters the best mode of employing the scavagers. The evils of the scavaging trade appear to me to spring chiefly from the parsimony of the parish authorities—either employing their own paupers without adequate remuneration, or else paying such prices to the contractors as almost necessitates the under-payment of the men in their employ. Were I to fill a volume, this is all that could be said on the matter.

Of the "Jet and Hose" System of Scavaging.

There appears at the present time a bent in the public mind for an improved system of scavagery. Until the ravages of the cholera in 1832, and again in 1848, roused the attention of Government and of the country, men seemed satisfied to dwell in dirty streets, and to congratulate themselves that the public ways were dirtier in the days of their fathers; a feeling or a spirit which has no doubt existed in all cities, from the days of those original scavagers, the vultures and hyenas of Africa and the East, the adjutants of Calcutta, and the hawks—the common glades or kites of this country—and which, we are told, in the days of Henry VIII. used to fly down among the passengers to remove the offal of the butchers and poulterers' stalls in the metropolitan markets, and in consideration of which services it was forbidden to kill them—down to the mechanical sweeping of the streets of London, and even to Mr. Cochrane's excellent street-orderlies.

Besides the plan suggested by Mr. Cochrane, whose orderlies cleanse the streets without wetting, and consequently without dirtying, the surface by the use of the watering-cart, there is the opposite method proposed by Mr. Lee, of Sheffield, and other gentlemen, who recommend street-cleansing by the hose and jet, that is to say, by flushing the streets with water at a high pressure, as the sewers are now flushed; and so, by *washing* rather than *sweeping* the dirt of the streets into the sewers, through the momentum of the stream of water, dispensing altogether with the scavager's broom, shovel, and cart.

In order to complete this account of the scavaging of the streets of London, I must, in conclusion, say a few words on this method, advocated as it is by the Board of Health, and sanctioned by scientific men. By the application of a hose, with a jet or water pipe attached to a fire-plug, the water being at high pressure, a stream of fluid is projected along the street's surface with force enough to *wash* away all before it into the sewers, while by the same apparatus it can be thrown over the fronts of the houses. This mode of street-cleansing prevails in some American cities, especially in Philadelphia, where the principal thoroughfares are said to be kept admirably clean by it; while the fronts of the houses are as bright as those in the towns of Holland, where they are washed, not by mechanical appliances, but by water thrown over them out of scoops by hand labour—one of the instances of the minute and indefatigable industry of the Dutch.

It is stated in one of the Reports of the Board of Health, that "unless cleansing be general and simultaneous, much of the dirt of one district is carried by traffic into another. By the subdivision of the metropolis into small districts, the duty of cleansing the *public* carriage-way is thrown upon a number of obscure and irresponsible authorities; while the duty of cleansing the *public* footways, which are no less important, *are* charged upon multitudes of private individuals." [The grammar

Original from HARVARD UNIVERSITY

is the Board of Health's grammar.] "It is a false pecuniary economy, in the case of the poorest inhabitants of court or alley, who obtain their livelihood by any regular occupation, to charge upon each family the duty of cleansing the footway before their doors. The performance of this service daily, at a rate of 1*d.* *per week* per house or per family, would be an economy in soap and clothes to persons the average value of whose time is never less than 2*d.* per hour." [This is at the rate of 2*s.* a day; did this most innocent Board *never* hear of work yielding 1*s.* 6*d.* a week? But the sanitary authorities seem to be as fond as teetotallers of "going to extremes."]

In another part of the same Report the process and results are described. It is also stated that for the success of this method of street purification the pavement must be good; for "a powerful jet, applied by the hose, would scoop out hollows in unpaved places, and also loosen and remove the stones in those that are badly paved." As every public place ought to be well-paved, this necessity of new and good pavement is no reasonable objection to the plan, though it certainly admits of a question as to the durability of the roads—the macadamized especially—under this continual soaking. Sir Henry Parnell, the great road authority, speaks of wet as the main destroyer of the highways.

It is stated in the Report, after the mention of experiments having been made by Mr. Lovick, Mr. Hale, and Mr. Lee (Mr. Lee being one of the engineering inspectors of the Board), that

"Mr. Lovick, at the instance of the Metropolitan Commissioners of Sewers, conducted his experiments with such jets as could be obtained from the water companies' mains in eligible places; but the pressure was low and insufficient. Nevertheless, it appeared that, taking the extra quantity of water required at the actual expense of pumping, the paved surfaces might be washed clean at one-half the price of the scavagers' manual labour in sweeping. Mr. Lee's trials were made at Sheffield, with the aid of a more powerful and suitable pressure, and he found that with such pressure as he obtained the cleansing might be effected in one-third the time, and at one-third the usual expense, of the scavagers' labour of sweeping the surface with the broom." [This expense varies, and the Board nowhere states at what rate it is computed; the scavagers' wages varying 100 per cent.]

"The effect of this mode of cleansing in close courts and streets," it is further stated, "was found to be peculiarly grateful in hot weather. The water was first thrown up and diffused in a thin sheet, it was then applied rapidly to cleansing the surface and the side walls, as well as the pavements." Mr. Lovick states that the immediate effect of this operation was to lower the temperature, and to produce a sense of freshness, similar to that experienced after a heavy thunder-shower in hot weather. But there is nothing said as to the probable effect of this state of things in winter—a hard frost for instance. The same expedient was resorted to for cooling the yards and outer courts of hospitals, and the shower thrown on the windows of the wards afforded great relief. Mr. Lovick, in his Report on the trial works for cleansing courts, states:—

"The importance of water as an agent in the improvement and preservation of health being in proportion to the unhealthiness or depressed condition of districts, its application to close courts and densely-populated localities, in which a low sanitary condition must obtain, is of primary importance. Having shown the practicability of applying this system (cleansing by jets of water) to the general cleansing of the streets, my further labours have been, and are now, directed to this end.

"For the purpose of ascertaining the effect produced by operations of this nature upon the atmosphere, two courts were selected: Church-passage, New Compton-street, open at both ends, with a carriage-way in the centre, and footway on each side; and Lloyd's-court, Crown-street, St. Giles's, a close court, with, at one entrance, a covered passage about 40 feet in length: both courts were in a very filthy condition; in Church-passage there were dead decaying cats and fish, with offal, straw, and refuse scattered over the surface; at one end an entrance to a private yard was used as a urinal; in every part there were most offensive smells.

"Lloyd's-court was in a somewhat similar condition, the covered entrance being used as a general urinal, presenting a disgusting appearance; the whole atmosphere of the court was loaded with highly-offensive effluvia; in the covered entrance this was more particularly discernible.

"The property of water, as an absorbent, was rendered strikingly apparent in the immediate and marked effects of its application, a purity and freshness remarkably contrasted to the former close and foul condition prevailing throughout. A test of this, striking and unexpected, was the change at different periods in the relative condition of atmosphere of the courts and of the contiguous streets. In their ordinary condition, as might have been expected, the atmosphere was purer in the streets than in the courts; it was to be inferred that the cleansing would have more nearly assimilated these conditions. This was not only the case, but it was found to have effected a complete change; the atmosphere of the courts at the close of the operations being far fresher and purer than the atmosphere of the streets. The effect produced was in every respect satisfactory and complete; and was the theme of conversation with the lookers-on, and with the men who conducted the operations.

"The expense of these operations, including water, would be, for—

"Church-passage (time, five minutes), 1¼*d.*

"Lloyd's-court (time, ten minutes), 3¼*d.*

"Mr. Hale, another officer, gave a similar statement."

Other experiments are thus detailed:—

"Lascelles-court, Broad-street, St. Giles's. This court was pointed out to me as one of the worst in London. Before cleansing it smelt *intolerable*," [*sic*] "and looked disgusting. Besides an abun-

Original from HARVARD UNIVERSITY

dance of ordinary filth arising from the exposure of refuse, the surface of the court contained heaps of human excrement, there being only one privy to the whole court, and that not in a state to be publicly used. . . . . . The cleansing operations were commenced by sprinkling the court with deodorising fluid, mixed with 20 times its volume of water; a great change, from a very pungent odour to an imperceptible smell, was immediately effected; after which the refuse of the court was washed away, and the pavement thoroughly cleansed by the hose and jet; and now this place, which before was in a state almost indescribable, presented an appearance of comparative comfort and respectability."

It is stated as the result of another experiment in "an ordinary wide street with plenty of traffic," that "water-carts and ordinary rains only create the mud which the jet entirely removes, giving to the pavement the appearance of having been as thoroughly cleansed as the private stone steps in front of the houses."

With respect to Mr. Lee's experiments in Sheffield, I find that Messrs. Guest, of Rotherham, are patentees of a tap for the discharge of water at high pressures, and that they had adapted their invention to the purpose of a fire-plug and stand pipe suitable for street-cleansing by the hose and jet. Church-street, one of the principal thoroughfares, was experimentally cleansed by this process: "The carriage-way is from 20 to 24 feet wide, and about 150 yards long. It was washed almost as clean as a house-floor in five minutes." Mr. Lee expresses his conviction that, by the agency of the hose and jet, every street in that populous borough might be cleansed at about 1*s.* per annum for each house. "The principal thoroughfares," he states, "could be thus made perfectly clean, three times every week, before business hours, and the minor streets and lanes twice, or once per week, at later hours in the day, by the agency of an abundant supply of water, at *less than half the sum necessary for the cartage alone* of an equal quantity of refuse in a solid or semi-fluid condition."

The highways most frequented in Sheffield constitute about one-half of the whole extent of the streets and roads in the borough, measuring 47 miles. This length, Mr. Lee computes, might be effectually cleansed with the hose and jet, ten miles of it three times a week, 21 miles twice a week, and 16 miles once a week, a total of 88 miles weekly, or 4576 miles yearly. The quantity of Water required would be 3000 gallons a mile, or a yearly total of 13,728,000 gallons. This water might be supplied, Mr. Lee opines, at 1*d.* per 1000 gallons (57*l.* 4*s.* per annum), although the price obtained by the Water-works Company was 6¼*d.* per 1000 gallons (371*l.* 16*s.* per annum). "I now proceed," he says, "to the cost of labour: 4576 miles per annum is equal to 14⅔ miles for each working day, or to six sets of two men cleansing 2½ miles per day each set. To these must be added three horses and carts, and three carters, for the removal of such *débris* as cannot be washed away and for such parts of the town as cannot be cleansed by this system, making a total of fifteen men. Their wages I would fix at 50*l.* per annum each. The estimate is as follows:—

	£
"Annual interest upon the first cost of hose and pipes, three horses and carts	30
Fifteen men's wages	750
Three horses' provender . . .	150
Wear, tear, and depreciation of hose, &c.	250
Management and incidentals, say . .	120
	£1300."

The estimate, it will be seen, is based on the supposition that *the water supply should be at the public cost,* and not a specific charge for the purposes of street-cleansing.

The 47 miles of highway of Sheffield is but three miles less than those of the city of London, the cost of cleansing which is, according to the estimate before given, no less than 18,000*l.*

The Sheffield account is divested of all calculations as to house-dust and ashes, and the charge for watering-carts; but, taking merely the sum paid to scavaging contractors, and assigning 1000*l.* (out of the 2485*l.*), as the proportion of salaries, &c., under the department of scavagery in the management of the City Commissioners, we find that while the expense of street-cleansing by the Sheffield hose and jet was little more than 34*l.*, in London, by the ordinary mode, it was upwards of 140*l.* per mile, or more than four times as much. The hose and jet system is said to have washed the streets of Sheffield as clean as a house-floor, which could not be said of it in London. The streets of the City, it should also be borne in mind, are now swept daily; Mr. Lee proposes only a periodical cleaning for Sheffield, or once, twice, and thrice a week. Of the cost of the experiments made in London with the hose and jet, in Lascelles-court, &c., nothing is said.

Street-cleansing by the hose and jet is, then, as yet but an experiment. It has not, like the street-orderly mode, been tested continuously or systematically; but the experiments are so curious and sometimes so startling in their results that it was necessary to give a brief account of them here, in order to render this account of the cleansing of the streets of the metropolis as comprehensive as possible. For my own part, I must confess the street-orderly system appears to excel all other modes of scavagery, producing at once the greatest cleanliness with the greatest employment to the poor. Nor am I so convinced as the theoretic and crotchety Board of Health as to the healthfulness of dampness, or the daily evaporation of a sheet of even clean water equal in extent to the entire surface of the London streets. It is certainly *doubtful,* to say the least, whether so much additional moisture might *improve* the public health, which the Board are instituted to protect; rain certainly contributes to cleanliness, and yet no one would advocate continued wet weather as a source of general convalescence.

I shall conclude this account of the scavaging

Original from HARVARD UNIVERSITY

of London, with the following brief statement as to the mode in which these matters are conducted abroad.

In Paris, where our system of parochial legislation and management is unknown, the scavaging of the streets—so frequently matters of private speculation with us—is under the immediate direction of the municipality, and the Government publish the returns, as they do of the revenue of their capital from the abattoirs, the interments, and other sources.

In the *Moniteur* for December 10, 1848, it is stated that the refuse of the streets of Paris sells for 500,500 francs (20,020*l.*), when sold by auction in the mass; and 3,800,000 francs (equal to 152,000*l.*) when, after having lain in the proper receptacles, until fit for manure, it is sold by the cubic foot. In 1823, the streets of Paris were leased for 75,000 francs (3000*l.*) per annum in 1831 the value was 166,000 francs (6640*l.*); and since 1845 the price has risen to the sum first named, viz., 500,500 francs (20,020*l.*); from which, however, is to be deducted the expense of cleansing, &c. I may add, that the receptacles alluded to are large places provided by Government, where the manure is deposited and left to ferment for twelve or eighteen months.

Of the Cost and Traffic of the Streets of London.

I have, at page 183 of the present volume, given a brief statement of the annual cost attending the keeping of the streets of the metropolis in working order.

The formation of the streets of a capital like London, the busiest in the world—streets traversed daily by what Cowper, even in his day, described as "the ten thousand wheels" of commerce—is an elaborate and costly work.

In my former account I gave an estimate which referred to the amount dispensed weekly in wages for the labour of the workmen engaged in laying down the paved roads of the metropolis. This was at the rate of 100,000*l.* per week; that is to say, calculating the operation of relaying the streets to occupy one year in every five, there is no less than 5,200,000*l.* expended in that time among the workpeople so engaged. The sum expended in labour for the continued repairs of the roads, after being so relaid, appears to be about 20,000*l.* per week*, or, in round numbers, about 1,000,000*l.* a year; so that the gross sum annually disbursed to the labourers engaged in the construction of the roads of London would seem to be about 2,250,000*l.*, that is to say, 1,000,000*l.* for repairing the old roads, and 1,250,000*l.* per annum for laying down new ones in their place.

It now remains for me to set forth the gross cost of the metropolitan highways, that is to say, the sum annually expended in both labour and materials, as well for relaying as for repairing the roads.

The granite-built streets cost, when relaid, about 11,000*l.* the mile, of ten yards' width, which is at the rate of 12*s.* 6*d.* the square yard, materials and labour included, the granite (Aberdeen) being 1*l.* 5*s.* per ton, and one ton of "seven-inch" being sufficient to cover about three square yards.

The average cost of a macadamized road, materials and labour included, if constructed from the foundation, is about 4400*l.* per street mile (ten yards wide)—5*s.* the superficial yard being a fair price for materials and labour.

Wood pavement, on the other hand, costs about 9680*l.* a mile of ten yards' width for materials and labour, which is at the rate of 11*s.* the superficial yard.

The cost of *repairs*, materials and labour included, is, for granite pavement about 1½*d.* per square yard, or 100*l.* the street mile of ten yards wide; for "Macadam" it is from 6*d.* to 3*s.* 6*d.*, or an average of 1*s.* 6*d.* per superficial yard, which is at the rate of 1320*l.* the street mile; while the wood pavement costs about the same for repairs as the granite.

The total cost of repairing the streets of London, then, may be taken as follows:—

	£
Repairing granite-built streets, per mile of ten yards wide	100
Repairing macadamized roads, per street mile	1320
Repairing wood pavement, per street mile	100

Or, as a total for all London,—

Repairing 400 miles of granite-built streets, at 100*l.* per mile	40,000
Repairing 1350 miles of macadamized streets, at 1320*l.* per mile	1,782,000
Repairing five miles of wood, at 100*l.* per mile	500
	£1,822,500

The following, on the other hand, may be taken as the total cost of *reconstructing* the London streets:—

	£
Granite-built streets, per mile ten yards wide	11,000
Macadamized streets, per street mile	4,400
Wood " "	9,680

Or, as a total for the entire streets and roads of London,—

	£
Relaying 400 miles of granite-built streets, at 11,000*l.* per mile	4,400,000
Relaying 1350 miles of macadamized streets, at 4400*l.* per mile	5,940,000
Relaying five miles of wood-built streets, at 9680*l.*	48,400
	£10,388,400

But the above refers only to the road, and besides this, there is, as a gentleman to whom I am much indebted for valuable information on the subject, reminds me, the foot paving, granite curb, and granite channel not included. The usual price for *paving* is 8*d.* per foot superficial,

* At p. 183 the sum of 18,225*l.* is said to be expended in repairs *annually*; it should have been *weekly*.

Original from HARVARD UNIVERSITY

when laid—granite curb 1*s.* 7*d.* per foot run, and granite channel 12*s.* per square yard.

"Now, presuming that three-fourths of the roads," says my informant, "have paved foot-paths on each side at an average width of six feet exclusive of curb, and that one-half of the macadamized roads have granite channels on each side, and that one-third of all the roads have granite curb on each side; these items for 400 miles of granite road, 1350 macadamized, and 5 miles of wood—together 1755 miles—will therefore amount to

	£ s. d.
Three-fourths of 1755 miles of streets paved on each side, six feet wide, at 8*d.* per foot superficial	2,779,392 0 0
One-half of 1350 miles of macadamized roads with one foot of granite channel on each side, at 12*s.* per yard square .	458,537 4 5
One-third of 1755 miles of road with granite curb on each side, at 1*s.* 7*d.* per foot run .	489,060 0 0
	3,726,989 4 5
Cost of constructing 1755 miles of roadway . . .	10,388,400 0 0
Total cost of constructing the streets of London . .	£14,115,389 4 5

"Accordingly the original cost of the metropolitan pavements exceeds fourteen millions sterling, and, calculating that this requires renewal every five years, the gross annual expenditure will be at the rate of 2,500,000*l.* per annum, which, added to 1,822,500*l.*, gives 4,322,500*l.*, or upwards of four millions and a quarter sterling for the entire annual cost of the London roadways.

"From rather extensive experience," adds my informant, "in building operations, and consequently in making and paying for roads, I am of opinion that the amount I have shown is under rather than above the actual cost.

"In a great many parts of the metropolis the roads are made by the servants of a body of Commissioners appointed for the purpose; and from dear-bought experience I can say they are a public nuisance, and would earnestly caution speculating builders against taking building ground or erecting houses in any place where the roads are under their control. The Commissioners are generally old retired tradesmen, and have very little to occupy their attention, and are often quite ignorant of their duties; I have reason to believe, too, that some of them even use their little authority to gratify their dislike to some poor builder in their district, by meddling and quibbling, and while that is going on the houses which have been erected can neither be let nor sold; so that as the bills given for the materials keep running, the builder, when they fall due, is ruined, for his creditors will not take his unlet houses for their debts, and no one else will purchase them until let, for none will rent them without proper accesses. I feel certain that in those parts where the roads are made by Commissioners three times more builders, in proportion to their number, get into difficulties than in the districts where they are permitted to make the roads themselves."

The paved ways and roads of London, then, it appears, cost in round numbers 10,000,000*l.* sterling, and require nearly 2,000,000*l.* to be expended upon them annually for repairs.

But this is not the sole expense attendant upon the construction of the streets of the metropolis. Frequently, in the formation of new lines of thoroughfare, large masses of property have to be bought up, removed, and new buildings erected at considerable cost. In a return made pursuant to an order of the Court of Common Council, dated 23rd October, 1851, for "An account of all moneys which have been raised for public works executed, buildings erected, or street improvements effected, out of the Coal Duties receivable by the Corporation of London in the character of trustees for administration or otherwise, since the same were made chargeable by Parliament for such purposes in the year 1766," the following items are given relating to the cost of the formation of new streets and improvements of old ones:—

Street Improvements forming New Thoroughfares.

	Amount raised for Public Works, &c. £. s. d.
Building the bridge across the river Thames, from Blackfriars, in the city of London, to Upper Ground-street, in the county of Surrey, now called Blackfriars Bridge, and forming the avenues thereto, and embanking the north abutment of the said bridge—(Entrusted to the Corporation of the city of London)	210,000 0 0
Making a new line of streets from Moorfields, opposite Chiswell-street, towards the east into Bishopsgate-street (now Crown-street and Sun-street), also from the east end of Chiswell-street westward into Barbican—(Corporation of the city of London) . .	16,500 0 0
Making a new street from Crispin-street, near Spitalfields Church, into Bishopsgate-street (now called Union-street), in the city of London and in the county of Middlesex—(Commissioners named in Act 18, George III., c. 78) .	9,000 0 0
Opening communications between Wapping-street and Ratcliffe-highway, and between Old Gravel-lane and Virginia-street, all in the county of Middlesex —(Commissioners appointed under Act 17, Geo. III., c. 22)	1,000 0 0
Formation of Farringdon-street, removal of Fleet-market, and erection of Farringdon-market, in the city of London —(Corporation of the city of London).	250,000 0 0
Formation of a new street from the end of Coventry-street to the junction of Newport-street and Long-acre (Cranbourn-street), continuing the line of street from Waterloo Bridge, already completed to Bow-street (Upper Wellington-street), and thence northward into Broad-street, Holborn, and thence to Charlotte-street, Bloomsbury, extending Oxford-street in a direct line through St. Giles's, so as to communicate with Holborn at or near Southampton-street (New Oxford-street); also widening the northern and

	£	s.	d.
Brought forward . .	486,500	0	0
southern extremities of Leman-street, Goodman's-fields, and forming a new street from the northern side of Whitechapel to the front of Spitalfields Church (Commercial-street), and forming a new street from Rosemary-lane to East Smithfield, near to the entrance of the London-docks; also formation of a street from the neighbourhood of the Houses of Parliament towards Buckingham Palace, in the city of Westminster (Victoria-street), all in the county of Middlesex; also formation of a line of new street between Southwark and Westminster Bridges, in the county of Surrey—(Her Majesty's Commissioners of Woods, Forests, and Land Revenues)	665,000	0	0
NOTE.—The Commissioners of Her Majesty's Woods have been authorised to raise further moneys on the credit of the duty of 1*d.* per ton for further improvements in the neighbourhood of Spitalfields, but the Chamberlain is not officially cognizant of the amount.			
Forming a new street from the northern end of Victoria-street, Holborn (formed by the Corporation to Clerkenwell-green, all in the county of Middlesex) —(Clerkenwell Improvement Commissioners)	25,000	0	0
Formation of a new line of streets from King William-street, London Bridge, to the south side of St. Paul's Cathedral, by widening and improving Cannon-street, making a new street from Cannon-street, near Bridge-row, to Queen-street, and another street from the west side of Queen-street, in a direct line to St. Paul's-churchyard, and widening Queen-street, from the junction of the said new street to Southwark Bridge; also improving Holborn Bridge and Field-lane, and effecting an improvement in Gracechurch-street and Ship Tavern-passage, all in the city of London—(Corporation of the city of London) . .	500,000	0	0
Finishing the new street left incomplete by the Clerkenwell Improvement Commissioners, from the end of Victoria-street, Farringdon-street, to Coppice-row, Clerkenwell, all in the county of Middlesex—(Corporation of the City of London)	88,000	0	0
Total cost of forming the above-mentioned new thoroughfares . . .	1,764,500	0	0

Improving existing Thoroughfares.

	£	s.	d.
Improving existing approaches, and forming new approaches to new London Bridge, viz., in High-street, Tooley-street, Montague-close, Pepper-alley Whitehorse-court, Chequer-court, Claingate, Churchyard-passage, St. Saviour's churchyard, Carter-lane, Boar's-head-place, Fryingpan-alley, Green Dragon-court, Joyner-street, Red Lion-street, Counter-street, Three Crown-court, and the east front of the Town Hall, all in the Borough of Southwark; also ground and premises at the north-west foot of London Bridge, Upper Thames-street, Red-cross-wharf, Mault's-wharf, High Timber-street and Broken-wharf, Swan-passage, Churchyard-alley, site of Fishmonger's Hall, Great East-cheap, Little Eastcheap, Star-court, Fish-street-hill, Little Tower-street, Idol-lane, St. Mary-at-hill, Crooked-lane, Miles-lane, Three Tun-alley, Warren-court, Cannon-street, Grace-church-street, Bell-yard, Martin's-lane, Nicholas-lane, Clement's-lane, Ab-church-lane, Sherborne-lane, Swithin's-lane, Cornhill, Lombard-street, Dove-court, Fox Ordinary-court, Old Post Office Chambers, Mansion-house-street, Princes-street, Coleman-street, Coleman-street-buildings, Moorgate-street, London Wall, Lothbury, Tokenhouse-yard, King's Arms-yard, Great Bell-alley, Packer's-court, White's-alley, Great Swan-alley, Crown-court, George-yard, Red Lion-court, Cateaton-street, Gresham-street, Milk-street, Wood-street, King-street, Basinghall-street, Houndsditch, Ladlane, Threadneedle-street, Aldgate High-street, and Maiden-lane, all in the City of London—(Corporation of the City of London)	1,016,421	18	1
Widening and improving the entrance into London near Temple-bar, improving the Strand and Fleet-street, and formation of Pickett-street, and for making a new street from the east end of Snow-hill to the bottom of Holborn-hill, now called Skinner-street—(Corporation of the City of London)	246,300	0	0
Widening and improving Dirty-lane and part of Brick-lane, leading from Whitechapel to Spitalfields, and for paving Dirty-lane, Petticoat-lane, Wentworth-street, Old Montague-street, Chapel-street, Princes-row, &c., all in the county of Middlesex—(Commissioners appointed by the Act 18, Geo. III., c. 80)	1,500	0	0
Widening the avenues from the Minories, through Goodman's-yard into Prescott-street, and through Swan-street and Swan-alley into Mansell-street, and from Whitechapel through Somerset-street into Great Mansell-street, all in the county of Middlesex —(Commissioners named in Act 18, George III., c. 50)	1,500	0	0
Total cost of improving the above-mentioned thoroughfares . . .	1,265,721	18	1

Paving.

	£	s.	d.
Paving the road from Aldersgate Bars to turnpike in Goswell-street, in the county of Middlesex—(Commissioners Sewers, &c., of the City of London) .	5,500	0	0
Completing the paving of the town borough of Southwark and certain parts adjacent—(Commissioners for executing Act 6, George III., for paving town and borough of Southwark)	4,000	0	0
Total cost of paving the above-mentioned thoroughfares	9,500	0	0

Hence the aggregate expense of the preceding improvements has been upwards of 3,000,000*l.* sterling.

I have now, in order to complete this account of the cost of paving and cleansing the thoroughfares of the metropolis, only to add the following statement as to the traffic of the principal thoroughfares in the city of London, for which I am indebted to Mr. Haywood, the City Surveyor.

By the subjoined Return it will be seen that there are two tides as it were in the daily current of locomotion in the City—the one being at its flood at 11 o'clock A.M., after which it falls gradually till 2 o'clock, when it is at its lowest ebb, and then begins to rise, gradually till 5 o'clock, when it reaches its second flood, and then begins to decline once more. The point of greatest traffic in the City is London-bridge, where the conveyances passing and repassing amount to 13,099 in the course of twelve hours*.

* At p. 185 the traffic of London Bridge is stated to be 13,000 conveyances per hour, instead of per 12 hours.

HARVARD UNIVERSITY

Of these it would appear, that 9351 consist of one-horse vehicles and equestrians, 3389 of two-horse conveyances, and only 359 of vehicles drawn by more than two horses. The one-horse vehicles would seem to be between two and three times as many as the two-horse, which form about one-fourth of the whole, while those drawn by more than two horses constitute about one-sixtieth of the entire number.

The Return does not mention the state of the weather on the several days and hours at which the observations were made, nor does it tell us whether there was any public event occurring on those days which was likely to swell or diminish the traffic beyond its usual proportions. The table, moreover, it should be remembered, is confined to the observations of only one day in each locality, so that we must be guarded in receiving that which records a mere accidental set of circumstances as an example of the general course of events. It would have been curious to have extended the observations throughout the night, and so have ascertained the difference in the traffic; and also to have noted the decrease in the number of vehicles passing during a continuously wet as well as a showery day. The observations should be further carried out to different seasons, in order to be rendered of the highest value. Mr. Haywood and the City authorities would really be conferring a great boon on the public by so doing.

Of the Rubbish Carters.

The public cleansing trade, I have before said, consists of as many divisions as there are distinct species of refuse to be removed, and these appear to be four. There is the *house*-refuse, consisting of two different kinds, as (1) the wet house-refuse or "slops," and "night-soil," and (2) the dry house-refuse, or dust and soot; and there is the *street*-refuse, also consisting of two distinct kinds, as (3) the wet street-refuse, or mud and dirt; and (4) the dry street-refuse or "rubbish."

I now purpose dealing with the labourers engaged in the collection and removal of the last-mentioned kind of refuse.

Technologically there are several varieties of "rubbish," or rather "*dirt*," for such appears to be the generic term, of which "rubbish" is *strictly* a species. Dirt, according to the understanding among the rubbish-carters, would seem to consist of any solid earthy matter, which is of an useless or refuse character. This dirt the trade divides into two distinct kinds, viz.:—

1. "Soft dirt," or refuse clay (of which "dry dirt," or refuse soil or mould, is a variety).

2. "Hard-dirt," or "hard-core," consisting of the refuse bricks, chimney-pots, slates, &c., when a house is pulled down, as well as the broken bottles, pans, pots, or crocks, and oyster-shells, &c., which form part of the contents of the dust-man's cart.

The phrase "hard-core"* seems strictly to mean all such refuse matter as will admit of being used as the foundation of roads, buildings, &c. "Rubbish," on the other hand, appears to be limited, by the trade, to "dry dirt;" out of the trade, however, and etymologically speaking, it signifies all such *dry* and *hard* refuse matter as is rendered useless by wear and tear*. The term *dirt*, on the other hand, is generally applied to *soft* refuse matter, and *dust* to *dry* refuse matter in a state of minute division, while *slops* is the generic term for all *wet* or *liquid* refuse matter. I shall here restrict the term rubbish to all that dry and hard refuse matter which is the residuum of certain worn-out or "used-up" earthen commodities, as well as the surplus earth which is removed whenever excavations are made, either for the building of houses, the cutting of railways, the levelling of roads, the laying down of pipes or drains, and the sinking of wells.

The commodities whose residuum goes to swell the annual supply of *rubbish*, are generally of an earthy nature. Such commodities as are made of *fibrous* or *textile* materials, go, when "used up," chiefly to form manure if of an animal nature, and to be converted into paper if of a vegetable origin. The refuse materials of our woollen clothes, our old coats and trousers, are either torn to pieces and re-manufactured into shoddy, or become the invigorators of our hop and other plants; whereas those of our linen or cotton garments, our old shirts and petticoats, form the materials of our books and letters; while our old ropes, &c., are converted into either brown paper or oakum. Those commodities, on the other hand, which are made of *leathern* materials, become, when worn out, the ingredients of the prussiate of potash and other nitrogenised products manufactured by our chemists. Our old *wooden* commodities, again, are used principally to kindle our fires; while the refuse of our fires themselves, whether the soot which is deposited in the chimney above, or the ashes which fall below, are employed mainly to increase the fertility of our land. Our worn-out *metal* commodities, on the other hand, are newly melted, and go to form fresh commodities when the metals are of the scarcer kind, as gold, silver, copper, brass, lead, and even iron; and when of the more common kind, as is the case with old tin, and occasionally iron vessels, they either become the ingredients in some of our chemical manufactures, or else when formed of tin are cut up into smaller and inferior commodities. Even the detritus of our *streets* is used as the soil of our market gardens. All this we have already seen, and we have now to deal more particularly with

* The *core* in this term may be a corruption of the Saxon *Carr*, a rock, rather than that which would at first suggest itself as its origin, viz., the Latin *cor*, the heart. *Hard-core* would therefore mean hard rock-like rubbish, instead of lumps of rubbish having a hard nucleus or heart.

* The term *rubbish* is a polite corruption of the original word *rubbage*, which is still used by uneducated people; *ish* is an *adjectival* termination, as whitish, slavish, brutish, &c., and is used only in connection with such substantives as are derived from adjectives, as English, Scottish, &c. Whereas the affix *age* is strictly substantival, as sewage, garbage, wharfage, &c., and is found applied only to adjectives derived from substantives, as *savage*. A like polite corruption is found in the word *pudding*, which should be strictly *puddin*: the addition of the g is as gross a mistake as saying *garding* for *garden*. There is no such verb as to *pud* whence could come the substantival participle *pudding*: and the French word from which we derive our term is *poudin* without the *g*, like *jardin*, the root of our *garden*.

the refuse of the sole remaining materials, viz., those of an *earthy* kind, and out of which are made our bricks, our earthenware and porcelain, as well as our glass, plaster, and stone commodities. What becomes of all these materials when the articles made of them are no longer fit for use? The old glass is, like the old metal, remelted and made into new commodities; some broken bottles are used for the tops of walls as a protection against trespassers; and the old bricks, when sound, are employed again for inferior brickwork; but what becomes of the rest of the earthen materials—the unsound bricks or "bats," the old plaster and mortar, the refuse slates and tiles and chimney-pots, the broken pans, and dishes, and other crocks—in a word, the potsherds and pansherds *, as the rubbish-carters call them—what is done with these?

But rubbish, as we have seen, consists not only of refuse earthen commodities, but of refuse earth itself: such as the soil removed during excavations for the foundations of houses, for the cuttings of railways, the levelling of roads, the formation of parks, the laying down of pipes or drains, and the sinking of wells. For each and all of these operations there is necessarily a certain quantity of soil removed, and the question that naturally occurs to the mind is, what is done with it?

There is, moreover, a third kind of rubbish, which, though having an animal origin, consists chiefly of earthy matter, and that is the shells of oysters, and other shell-fish. Whence go they, since these shells are of a comparatively indestructible nature, and thousands of such fish are consumed annually in the metropolis? What, the inquirer asks, becomes of the refuse bony coverings of such fish?

Let us first, however, endeavour to estimate what quantity of each of these three kinds of rubbish is annually produced in London, beginning with the refuse earthen commodities.

There is no published account of the quantity of *crockeryware* annually manufactured in this country. Mr. McCulloch tells us, "It is estimated, that the *value* of the various sorts of earthenware produced at the potteries may amount to about 1,700,000*l.* or 1,800,000*l.* a year; and that the earthenware produced at Worcester, Derby, and other parts of the country, may amount to about 850,000*l.* or more, making the whole value of the manufacture 2,550,000*l.* or 2,650,000*l.* a year." What proportion of this quantity may fall to the share of the metropolis, and what proportion of the whole may be annually destroyed, I know of no means of judging. We must therefore go some other way to work in order to arrive at the required information. Now, it has been before shown, that the quantity of "dust," or dry refuse from houses, annually collected, amounts to 900,000 tons or chaldrons yearly; and I find, on inquiry at the principal "yards," that the average quantity of Potsherds and broken crockery is at the rate of about half a bushel to every load of dust, or say 1 per cent. out of the entire quantity collected. At other yards, I find the proportion of sherds to be about the same, so that we may fairly assume that the gross quantity of broken earthenware produced in London is in round numbers 9000 loads or tons per annum. The sherds run about 250 pieces to the bushel, and assuming every five of such pieces to be the remains of an entire article, there would be in each bushel the fragments of fifty earthenware vessels; and thus the total quantity of crockeryware destroyed yearly in the metropolis will amount to 18,000,000 vessels.

As to the quantity of *refuse bricks*, the number annually produced, which is between 1,500,000,000 and 2,000,000,000, will give us no knowledge of the quantity yearly converted into rubbish. In order to arrive at this, we must ascertain the number of houses pulled down in the course of the twelvemonth; and I find, by the Returns of the Registrar-General, that the buildings removed between 1841 and 1851 have been as follows:—

DECREASE IN THE NUMBER OF HOUSES THROUGHOUT LONDON BETWEEN 1841 AND 1851.

	Total Decrease in 10 Years.	Annual Average Decrease.
St, Martin's	116	11·6
St. James's, Westminster	130	13·0
St. Giles's	181	18·1
Strand	389	38·9
Holborn	86	8·6
East London	11	1·1
West London	265	26·5
London, City of	592	59·2
Whitechapel	2	·2
St. Saviour's, Southwark	46	4·6
St. Olave's	158	15·8
Total	1976	197·6

Thus, then, we perceive that there have been, upon an average, very nearly 200 houses annually pulled down in London within the last ten years, and I find, on inquiry among those who are likely to be the best-informed on such matters, that each house so pulled down will yield from 40 to 50 loads of rubbish; so that, altogether, the quantity of refuse bricks, slates, tiles, chimney-pots, &c., annually produced in London must be no less than 8000 loads.

But the above estimate refers only to those houses which have been pulled down and never rebuilt; so that, in order to arrive at the gross quantity of this kind of rubbish yearly produced in the metropolis, we must add to the preceding amount the quantity accruing from such houses as are pulled down and built up again, or newly fronted and repaired, which are by far the greater number. These, I find, may be estimated at between 5 and 10 per cent. of the gross number of houses in

* This is the Saxon *sceard*, which means a sheard, remnant, or fragment, and is from the verb *sceran*, signifying both to shear and to share or divide. The low Dutch *schaard* is a piece of pot, a fragment.

the metropolis. In some quarters (the older parts of London, for instance,) the proportion is much higher, while in the suburbs, or newer districts, it is scarcely half per cent. Each of the houses so new-fronted or repaired may be said to yield, on an average, 10 loads of rubbish, and, at this rate, the yearly quantity of refuse bricks, mortar, &c., proceeding from such a source, will be 150,000 loads per annum; so that the total amount of rubbish produced in London by the demolition and reparation of houses would appear to be about 160,000 loads yearly.

The quantity of refuse *oyster shells* may easily be found by the number of oysters annually sold in Billingsgate-market. These, from the returns which I obtained from the market salesmen, and printed at p. 63 of the first volume of this work, appear to be, in round numbers, 500,000,000; and, calculating that one-third of this quantity is sent into the country, the total number of shells remaining in the metropolis may be estimated at about 650,000,000. Reckoning, then, that 500 shells go to the bushel (the actual number was found experimentally to be between 525 and 550), and consequently that 20,000 are contained in every load, we may conclude that the gross quantity of refuse oyster shells annually produced in London average somewhere about 30,000 loads. That this is an approximation to the true quantity there can be little doubt, for, on inquiry at one of the largest dust-yards, I was informed by the hill-man that the quantity of oyster-shells collected with the refuse dust from houses in the vicinity of Shoreditch, Whitechapel, and other localities at the east-end of the metropolis, averages 6 bushels to the load of dust; about the west-end, however, half a bushel or a bushel to each load is the average ratio; while from the City there is none, the house "dust" there being free from oyster-shells. In taking one district, however, with another, I am assured that the average may be safely computed at 2 bushels of oyster-shells to every 3 loads of dust; hence, as the gross amount of house-dust is equal to 900,000 tons or loads per annum, the quantity of refuse oyster-shells collected yearly by the dustmen may be taken at 15,000 loads. But, besides these, there is the quantity got rid of by the costermongers, which seldom or never appear in the dust-bins. The costers sell about 124,000,000 oysters per annum, and thus the extra quantity of shells resulting from these means would be about 12,400 loads; so that the gross quantity of refuse oyster-shells actually produced in London may be said to average between 25,000 and 30,000 loads per annum.

There still remains the quantity of *refuse earth* to be calculated; this may be estimated as follows:—

1. *Foundations of Houses.*—Each house that is built requires the ground to be excavated from two to three yards deep, the average area of each being about nine yards square. This gives between 160 and 200 cubic yards of earth removed from the foundation of each house. A cubic yard of earth is a load, so that there are between 160 and 200 loads of earth displaced in the building of every new house.

The following statement shows—

THE NUMBER OF HOUSES BUILT THROUGHOUT LONDON BETWEEN 1841 AND 1851.

	Total No. of Houses built in 10 Years.	Average No. of Houses built per Year.
West Districts . . .	9,624	962·4
North Districts . . .	13,778	1377·8
Central Districts . .	349	34·9
East Districts . . .	8,343	834·3
South Districts . . .	14,807	1480·7
Total . .	46,901	4690·1

Hence, estimating the number of new houses built yearly in the metropolis at 4500, the total quantity of earth removed for the foundations of the buildings throughout London would be 800,000 loads per annum.

2. *The Cuttings of Railways.*—The railways formed within the area of the metropolis during the last ten years have been—the Great Northern; the Camden Town, and Bow; the West India Docks and Bow; and the North Kent Lines. The extension of the Southampton Railway from Vauxhall to Waterloo-bridge, as well as the Richmond Line, has also been formed within the same period, but for these no cuttings have been made.

The Railway Cuttings made within the area of the Metropolis Proper during the last ten years have been to the following extent:—

RAILWAYS.	Length of Cutting.	Width of Cutting.		Depth of Cutting.	Quantity of earth Removed.
		At top.	At bottom.		
	Miles.	Yards.	Yards.	Yards.	Loads.
Great Northern . . .	1¼	12	10	10	290,400
Camden Town and Bow .	1¼	12	10	10	290,400
West India Docks and Bow	2	15	10	12	528,000
North Kent	2	15	10	12	528,000

Hence, the gross quantity of earth removed from railway cuttings within the last ten years has been 1,636,800 loads, or say, in round numbers, 160,000 loads per annum.

3. *The Cutting of Roads and Streets.*—According to a Return presented to Parliament, there were 200 miles of new streets formed within the metropolitan police district between the years 1839-49; but in the formation of these no earth has been taken away; on the contrary a considerable quantity has been required for their construction. In the case of the lowering of Holborn-hill, that which was removed from the top was used to fill up the hollow.

4. *The Formation of Parks.*—The only park that has been constructed during the last ten years in the metropolis is Victoria Park, at the east end of the town; but I am informed that, in the course of the works there, no earth was carted away, the soil which was removed from one part being used for the levelling of another.

5. *Pipe and Sewer Works.*—The earth displaced in the course of these operations is usually put back into the ground whence it was taken, excepting in the formation of some new sewer, and then a certain proportion has to be carted away. Upon inquiry among those who are likely to be best informed, I am assured that 1000 loads may be taken as the quantity carted away in the course of the last year.

6. *Well-sinking.*—In this there has been but little done. Those who are best informed assure me that within the last ten years no such works of any magnitude have been executed.

The account as to the quantity of rubbish removed in London, then, stands thus:—

	Loads per Annum.
Refuse Earthen Materials.	
Potsherds and Pansherds . . .	9,000
Old bricks, tiles, slates, mortar, &c. .	160,000
Oyster-shells	25,000
Refuse Earth.	
Foundations of houses	800,000
Railway cuttings	160,000
Pipe and sewer laying	1,000
	1,155,000

Thus, then, we perceive that the gross quantity of rubbish that has to be annually removed throughout the metropolis is upwards of 1,000,000 loads per annum.

Now what is done with the vast amount of refuse matter? Whither is it carried? How is it disposed of?

The rubbish from the house building or removing is of no value to the master carter, and is shot gratuitously wherever there is the privilege of shooting it; this privilege, however, is very often usurped. Great quantities used to be shot in what were, until these last eight years, Bishop Bonner's Fields, but now Victoria Park. At the present time this sort of rubbish is often slily deposited in localities generally known as "the ruins," being places from which houses, and indeed streets, have been removed, and the sites left bare and vacant.

But the main localities for the deposition of this kind of refuse are in the fields round about the metropolis. Each particular district appears to have its own special "shoot," as it is called, for rubbish, of which the following are the principal.

Rubbish shoots.

The rubbish of Kensington and Chelsea is shot in the Pottery Grounds and Kensington-fields.
The rubbish of St. George's Hanover-square, Marylebone, and Paddington, is shot in the fields about Notting-hill and Kilburn.
The rubbish of Westminster, Strand, Holborn, St. Martin's, St. Giles's, St. James's, Westminster, West London, and Southwark, is shot in Cubitt's fields at Millbank and Westminster improvements.
The rubbish of Hampstead is shot in the fields at back of Haverstock-hill.
The rubbish of Saint Pancras is shot in the Copenhagen-fields.
The rubbish of Islington, Clerkenwell, and St. Luke's, is shot in the Eagle Wharf-road and Shepherdess-fields.
The rubbish of East London and City is shot in the Haggerstone-fields.
The rubbish of Whitechapel, St. George's in the East, and Stepney, is shot in Stepney fields.
The rubbish of Hackney, Bethnal-green, and Shoreditch, is shot in the Bonkers-pond, Hackney-road.
The rubbish of Poplar is shot in the fields at back of New Town, Poplar.
The rubbish of Bermondsey is shot in the Bermondsey fields.
The rubbish of Newington, Camberwell, and Lambeth, is shot in Walworth-common and Kennington-fields.
The rubbish of Wandsworth is shot in Pottershole, Wandsworth-common.
The rubbish of Greenwich and Lewisham is shot in Russia-common, near Lewisham.
The rubbish of Rotherhithe is used for ballast.

The quantity of rubbish annually shot in each of the above-mentioned localities appears to range from 5000 up to as high as 30,000 and 40,000 loads.

Of the earth removed in forming the foundation of new houses, between one-fourth and one-sixth of the whole is used to make the gardens at the back, and the bed of the roads in front of them, while the entire quantity of the soil displaced in the execution of the "cuttings" of railways is carted away in the trucks of the company to form embankments in other places. Hence there would appear to be about from 160,000 to 200,000 loads of refuse bricks, potsherds, pansherds, and oyster-shells, and about 600,000 loads of refuse earth deposited every year in the fields or "shoots" in the vicinity of the metropolis.

The refuse earth displaced in forming the foundations of houses is generally carted away by the builders' men, so that it is principally the refuse bricks, &c., that the rubbish-carters are engaged in removing; these they usually carry to the shoots already indicated, or to such other localities where the hard core may be needed for forming the foundation of roads, or the rubbish be required for certain other purposes.

The principal *use to which the "rubbish" is put*

is for levelling, when the hollow part of any newly-made road has to be filled up, or garden or lawn ground has to be levelled for a new mansion. Rubbish, at one time, was in demand for the ballasting of small coasting vessels. For such ballasting 2*d.* a ton has to be paid to the corporation of the Trinity House. This rubbish has been used, but sometimes surreptitiously, for ballast, unmixed with other things. It is, however, light and inferior ballast, and occupies more space than the gravel ballast from the bed of the Thames.

Suppose that a collier requires ballast to the extent of 60 tons; if house rubbish be used it will occupy the hold to a greater height by about 10 inches than would the ballast derived from the bed of the Thames. The Thames ballast is supplied at 1*s.* a ton; the rubbish-ballast, however, was only 3*d.* to 6*d.* a ton, but now it is seldom used unless to mix with manure, which might be considered too wet and soft, and likely to ferment on the voyage to a degree unpleasant even to the mariners used to such freights. The rubbish, I am told, checks the fermentation, and gives consistency to the manure.

I am assured by a tradesman, who ships a considerable quantity of stable manure collected from the different mews of the metropolis, that comparatively little rubbish is now used for ballast (unless in the way I have stated); even for mixing, but a few tons a week are required up and down the river, and perhaps a small quantity from the wharfs on the several canals. Nothing was ever paid for the use of this rubbish as ballast, the carters being well satisfied to have the privilege of shooting it. Two of the principal shoots by the river side were at Bell-wharf, Shadwell, and off Wapping-street. The rubbish of Rotherhithe, it will be seen, is mainly "shot" as ballast.

The "*hard-core*" is readily got rid of; sometimes it is shot gratuitously (or merely with a small gratuity for beer to the men); but if it have to be carted three or four miles, it is from 2*s.* 6*d.* to 3*s.* a load. This is used for the foundations of houses, the groundwork of roads, and other purposes where a hard substratum is required. The hard-core on a new road is usually about nine inches deep. There are on an average 20 miles of streets, 15 yards wide, formed annually in London. Hence there would be upwards of 100,000 loads of hard-core required for this purpose alone. Where the soil is of a gravelly nature, but little hard rubbish is needed. Oyster-shells *did* form a much greater portion than they do now of the hard substratum of roads. Eight or nine years ago the costermongers could sell their oyster-shells for 6*d.* a bushel. Now they cannot, or do not, sell them at all; and the law not only forbids their deposit in any place whatever, but forbids their being scattered in the streets, under a penalty of 5*l.* But as the same law provides no place where these shells may be deposited, the costermongers are in what one of them described to me as "a quandary." One man, who with his wife kept two stalls in Tottenham Court-road, one for fish (fresh and dried) and for shell-fish, and the other for fruit and vegetables, told me that he gave "one of those poor long-legged fellows who were neither men nor boys, and who were always starving and hanging about for a two-penny job, two-pence to carry away a hamper-full of shells and get rid of them as he best could. O, where he put them, sir," said the man, "I don't know, I wouldn't know; and I shouldn't have mentioned it to you, only I saw you last winter and know you're inquiring for an honest purpose."

Another costermonger who has a large barrow of oysters and mussels, and sometimes of "wet fish" near King's-cross, and at the junction of Leather-lane with Back-hill, Hatton-garden, was more communicative: "If you'll walk on with me, sir," he said, "*I'll* show you where they're shot. You may mention my name if you like, sir; I don't care a d—— for the crushers; not a blessed d——." He accordingly conducted me to a place which seemed adapted for the special purpose. At the foot of Saffron-hill and the adjacent streets runs the Fleet-ditch, now a branch of the common sewers; not covered over as in other parts, but open, noisome, and, as the dark water flows on, throwing up a sickening stench. The ditch is indifferently fenced, so that any one with a little precaution may throw what he pleases into it. "There, sir," said my companion, "there's the place where more oyster-shells is thrown than anywhere in London. They're thrown in in the dark." Assuredly the great share of blame is not to those who avail themselves of such places for illegal purposes, but to those who leave such filthy receptacles available. The scattered oyster-shells along all the approaches, on both sides, to this part of the open Fleet-ditch, evince the use that is made of it in violation of the law. Many of the costers, however, keep the shells by them till they amount to several bushels, and then give the rubbish-carters a few pence to dispose of them for them.

Some of the costermongers, again, obtain leave to deposit their oyster-shells in the dustmen's yards, where quantities may be seen whitening the dingy dust-heaps, and a large quantity are collected with the house-dust and ashes, together with the broken crockery from the dust-bins of the several houses. The oyster-shells are carted away with the pan-sherds, &c., for the purposes I have mentioned.

I now come to deal with the rubbish-carters, that is to say, with the labourers engaged in the removal of the "hard" species of refuse; of which we have seen there are between 160,000 and 200,000 loads annually carted away; the refuse earth, or "soft dirt," being generally removed by the builders' men, and the refuse, crockeryware, &c., by the dustmen, when collecting the dust from the "bins" of the several houses.

The master *Rubbish-Carters* are those who keep carts and horses to be hired for carting away the old materials when houses or walls are pulled down. They are also occasionally engaged in carrying away the soil or rubbish thrown up from the foundations of buildings; the excavations of docks, canals, and sewers; the digging

Original from HARVARD UNIVERSITY

of artesian wells, &c. This seems to comprise what in this carrying or removing trade is accounted "rubbish."

Perhaps not one of these tradesmen is solely a rubbish-carter, for they are likewise the carters of new materials for the use of builders, such as lime, bricks, stone, gravel, slates, timber, iron-work, chimney-pieces, &c. Some of them are public carmen; licensed carmen if they work, or ply, in the City; but beyond the City boundaries no licence is necessary. This complication perplexes the inquiry, but I purpose to confine it, as much as possible, to the rubbish-carters proper, having defined what may be understood by "rubbish." These carters are also employed in digging, pick-axing, &c., at the buildings, the rubbish of which they are engaged to remove.

Among the conveyors of rubbish are no distinctions as to the kind. Any of them will one week cart old bricks from a house which has been pulled down, and the next week be busy in removing the soil excavated where the foundations and cellars of a new mansion have been dug.

From inquiries made in each of the different districts of the metropolis, there appear to be from 140 to 150 tradesmen who, with the carting of bricks, lime, and other building commodities, add also that of rubbish-carting. These "masters" among them find employment for 840 labouring men, some of whom I find to have been in the service of the same employer upwards of 20 years.

The Post-Office Directory, under the head of rubbish-carters, gives the names of only 35 of the principal masters, of whom several are marked as scavagers, dust-contractors, nightmen, and road-contractors. The occupation abstract of the census, on the other hand, totally ignores the existence of any such class of workmen, masters as well as operatives. I find, however, by actual visitation and inquiry in each of the metropolitan districts, and thus learning the names of the several masters as well as the number of men in their employment, that there may be said to be, in round numbers, 150 master rubbish-carters, employing among them 840 operatives throughout London.

A large proportion of this number of labouring men, however, are casual hands, who have been taken on when the trade was busy during the summer (which is the the "brisk season" of rubbish-cartage), and who are discharged in the slack time; during which period they obtain jobs at dust-carting or scavaging, or some such out-door employment. Among the employers there are scarcely any who are purely rubbish-carters, the large majority consisting of dust and road-contractors, carmen, dairymen, and persons who have two or three horses and carts at their disposal. When a master builder or bricklayer obtains a contract, he hires horses and carts to take away any rubbish which may previously have been deposited. The contract of the King's Cross Terminus of the Great Northern Railway, for instance, has been undertaken by Mr. W. Jay, the builder; and, not having sufficient conveyances to cart the rubbish away, he has hired horses and carts of others to assist in the removal of it. The same mode is adopted in other parts of the metropolis, where any improvements are going on. The owners of horses and carts let them out to hire at from 7*s.* for one horse, to 14*s.* for two per day. If, however, the job be unusually large, the master rubbish-carters often take it by contract themselves.

Although the *operative rubbish-carters* may be classed among unskilled labourers, they are, perhaps, less miscellaneous, as a body, than other classes of open-air workers. Before they can obtain work of the best description it is necessary that they should have some knowledge of the management of a horse in the drawing of a loaded carriage, or of the way in which the animal should be groomed and tended in the stable. I was told by an experienced carman, that he, or any one with far less than his experience, could in a moment detect, merely by the mode in which a man would put the harness on a horse and yoke him to the cart, whether he was likely to prove a master of his craft in that line or not. My informant had noticed, more especially many years ago, when labour was not so abundantly obtainable as it was last year, that men out of work would offer him their services as carmen even if they had never handled a whip in their lives, as if little more were wanted than to walk by the horse's side. An experienced carter knows how to ease and direct the animal when heavily burdened, or when the road is rugged; and I am assured by the same informant, that he had known one of his horses more fatigued after traversing a dozen miles with a "yokel" (as he called him), or an incompetent man, than the animal had been after a fifteen miles' journey with the same load under the care of a careful and judicious driver. This knowledge of the management of a horse is most essential when men are employed to work "single-handed," or have confided to them singly a horse and cart; when they work in gangs it is not insisted upon, except as regards the "carman," or the man having charge of the horse or the team.

The master rubbish-carters generally are more particular than they used to be as to the men to whom they commit the care of their horses. It may be easy enough to learn to drive a horse and cart, but a casual labourer will now hardly get employment in rubbish-carting of a "good sort" unless he has attained that preliminary knowledge. The foreman of one of the principal contractors said to me, "It would never do to let a man learn his business by practising on our horses." I mention this to show, that although rubbish-carting is to be classed among unskilled labours, *some* training is necessary.

I am informed that one-third of the working rubbish-carters have been rubbish-carters from their youth, or cart, car, or waggon-drivers, for they all seem to have known changes; or they have been used to the care of horses in the capacity of ostlers, stable-men, helpers, coaching-inn porters, coachmen, grooms, and horse-breakers. Of

the remainder, one-half, I am informed, have "had a turn" at such avocations as scavagery, bricklayers' labouring, dock work, railway excavating, night work, and the many toils to which such men resort in their struggles to obtain bread, whatever may have been their original occupation, which is rarely that of an artizan. The other, and what may be called the greater half of the remaining number, is composed of agricultural labourers who were rubbish-carters in the country, and of the many men who have had the care of horses and vehicles in the provinces, and who have sought the metropolis, depending upon their thews and sinews for a livelihood, as porters, or carmen, or labourers in almost any capacity. The most of these men at the plough, the harrow, the manure-cart, the hay and corn harvests, have been practised carters and horse drivers before they sought the expected gold in the streets of London. Full a third of the whole body of rubbish-carters are Irishmen, who in Ireland were small farmers, or cottiers, or agricultural labourers, or belonged to some of the classes I have described.

The mechanics among rubbish-carters I heard estimated, by men with equal means of information, as one in twenty and one in fifteen. Among these *quondam* mechanics were more farriers, cart and wheel wrights, than of other classes.

It seems to be regarded as an indispensable thing that working rubbish-carters should have one quality—bodily strength. I am told that one employer, who died a few weeks ago, used to say to any applicant for work, "It's no use asking for it, if you wish to keep it, unless you can lift a horse up when he's down."

As I have shown of the scavagers, &c., the employers in rubbish-carting may be classed as "honourable" and "scurfs." The men do not use the word "honourable," nor any equivalent term, but speak of their masters, though with no great distinctiveness, as being either "good," or "scurfs." As in other branches of unskilled labour where there are no trade societies or general trade regulations among the operatives, there are few distinctive appellations.

From the facts I have collected in connection with this trade, it would appear that there are 180 master rubbish-carters in the metropolis, about 140 of whom pay 18*s*. or more per week as wages, while the remaining 40 pay less than that amount. The latter constitute what the men term the scurf portion of the trade; so that the honourable masters among the rubbish-carters may be said to comprise seven-ninths of the whole.

I will first treat of the circumstances, characteristics, and wages of the men employed in the honourable trade.

And first, as regards *the division of labour* among the operative rubbish-carters, the work is as simple as possible.

There are—

1. *The Rubbish-Carters* proper, or "carmen," who are engaged principally in conveying the refuse brick or earth to the several shoots.

2. *The Rubbish-Shovellers*, or "gangers," who are engaged principally in filling the cart with the rubbish to be removed. Generally speaking, the two offices are performed by the same individual, who is both carter and shoveller, and it is only in large works that the gangers are employed.

Master builders and others who require the aid of rubbish-carters for the removal of earth or any other kind of rubbish from ground about to be built upon, or from old buildings about to be repaired or pulled down, either hire horses, carts, and carmen, by the day, of the master rubbish-carters, or pay a certain price per load for the removal of the rubbish. If the job be likely to last some length of time, the builders pay the masters so much per load for carting away the rubbish; but if the job be only for a short period, the horses, carts, and carmen are hired of the masters for the time. The price paid to the master rubbish-carter ranges from 2*s*. 6*d*. to 3*s*. 6*d*. per load for the removal of rubbish and bringing back such bricks, lime, or sand as may be required for the building. The master rubbish-carter, in all cases, pays the men engaged in the removal of the rubbish.

The operative rubbish-carters (except in a very few instances) never work in gangs, either in the construction of new buildings or in old buildings about to be pulled down or repaired. In digging the foundations of new houses, the master builders, or speculators, building upon their own ground employ their own excavators, and engage rubbish-carters to remove the refuse earth, the latter being merely occupied in carting it away.

The principle of simple co-operation or gang-work occasionally prevails; and, when this is the case, the gang is employed in shovelling and picking, while the carman, as the shovellers throw out the rubbish, fills or shovels the rubbish into the cart.

Each rubbish-carter will, on an average, convey away from two to five loads a day, according to the distance he has to take it. Calculating 850 men to remove four loads per diem for five months in a year, the gross quantity of rubbish annually removed would be very nearly 326,000 loads.

In the regular trade *the hours of daily labour* are twelve, or from six to six; but the men are allowed half an hour for breakfast, an hour for dinner, and half an hour for tea, and almost invariably leave at half-past five, so postponing the "tea" half-hour until after the termination of their work. In winter the hours are generally "between the lights," but on very short, dark, or foggy days, lanterns are used. The men employed by one firm "often made up," I was told by one of them, "for lost time, by shovelling by moonlight." The carman, however, has to get to his stable in the summer at four o'clock in the morning, and to tend his horse after he has done work at night; so that the usual hours of labour with him are fifteen and sixteen per day, as well as Sunday-work.

The rubbish-carters are *paid by the week*, 18*s*. to 20*s*. being the weekly amount; and by *the load*, which is indeed piece-work. The payment to the

operatives by the load varies from 6*d.* to 1*s.* 6*d.*, for it is necessarily regulated by the distance to be traversed. If the rubbish have to be carted a mile to its destination—or, as the men call it, to "the shoot"—of course it is to be so conveyed at a proportionally lower rate than if it had to be driven two or three miles. The employment of men by the load, however, becomes less every year, and the reason, I am assured, is this:—The great stress of the labour falls upon the horse. If the animal be strong and manageable, a man, for the sake of conveying an extra load a day, might overtax its powers, injure it gradually, and deteriorate its strength and its value. The operative carters, on their part, have complained that sometimes even "good" employers have set them to work by the load with "hard old horses," which no management could get out of their slow, long-accustomed pace. Thus a man might clear by the piece-work but 1*s.* 6*d.* a day, with a horse not worth 15*l.*; while another carter, with a superior animal worth twice as much, might clear 3*s.* or 3*s.* 6*d.* Some "hard" masters, I was informed, liked these old horses, because they were bought cheap, and though they brought in less than superior animals they were easier kept; while if less were earned by the piece-work with such horses, less was paid in wages; and if the horse broke its leg, or was killed, or injured, it was more easily replaced. This mode of employment is, as I have said, less and less carried into effect; but it is still one of the ways in which a working carter may be made a sufferer, because a principal accessary of his work—the horse—may not be capable of the requisite exertion.

The nominal wages of the rubbish-carters in the best employ are from 18*s.* to 20*s.* a week; in the worse-paid trade 15*s.* is the more general price; but even as little as 12*s.* is given by some masters.

The actual wages are the same as the nominal in the honourable trade, with the addition of perquisites in beer to the men of from 1*s.* to 2*s.* weekly, and of "findings," especially to the carmen, of an amount I could not ascertain, but perhaps realizing 6*d.* a week. One carman put all he found on one side to buy new year's clothes for his children, and on new year's eve last year he had 48*s.* 0½*d.*, "money, and what brought money;" but this is far from an usual case.

The rate of wages paid to the operative rubbish-carters throughout the different districts of London, I find, by inquiries in each locality, to be by no means uniform. For instance, at Hampstead the wages are unexceptionally 20*s.* per week; while at Kensington, Chelsea, and indeed the whole of the west districts of London, they are 18*s.* weekly; in St. Martin's parish, however, 19*s.* a week is paid by two masters. In the north districts again, 18*s.* a week is generally paid; with the exception of Hampstead, where the weekly wages for the same labour are as high as 20*s.*, and Islington, where they are as low as 16*s.* In the central districts, too, the wages are generally 18*s.*; the lower rate of 17*s.* and 16*s.* per week being paid in certain places by "cutting" and "grasping" individuals, who form isolated exceptions to the rule. In a certain portion of the eastern districts, such as Bethnal Green, St. George's in the East, and Stepney, 16*s.* and 15*s.* a week appears to be the rule; while in Shoreditch and Poplar 18*s.* is paid by all the masters. The southern districts of the metropolis are equally irregular in their rates of wages. Lewisham pays as low as 15*s.*, and Woolwich the same weekly sum, with one exception. Wandsworth, on the other hand, pays uniformly 17*s.*; while in Southwark, Bermondsey, Newington, and Camberwell, the wages paid by all are 18*s.* In Lambeth as much as 19*s.* is given by two masters out of three; whereas, in Greenwich one master pays 14*s.*, and the other even as low as 12*s.* a week. When I come to treat of the lower-paid trade, I shall explain the causes of the above difference as regards wages.

The analysis of the facts I have collected on this subject is as follows:—Out of 180 masters, employing among them 840 men, there are—

				Wages per Week.
5	masters employing	11	men, and paying	20*s.*
5	,, ,,	30	,, ,,	19*s.*
127	,, ,,	605	,, ,,	18*s.*
6	,, ,,	20	,, ,,	17*s.*
16	,, ,,	70	,, ,,	16*s.*
19	,, ,,	97	,, ,,	15*s.*
1	,, ,,	5	,, ,,	14*s.*
1	,, ,,	2	,, ,,	12*s.*

Hence, three-fourths of the operatives may be said to receive 18*s.* weekly, and about one-sixth 16*s.*

The perquisites in this trade are more in beer than in money, nor are they derived from the employers, unless exceptionally. They are given to the rubbish-carters by the owners of the premises where they work, and may, in the best trade, amount, in beer or in money to buy beer, to from 1*s.* 6*d.* to 2*s.* weekly per man. The other perquisites are what is found in the digging of the rubbish for the carts, and in the shooting of it. As in other trades of a not dissimilar character, there appears to be no fixed rule as to "treasure trove." One man told me that in digging or shovelling each man kept what he found; another said the men drank it. Anything found, however, when the cart is emptied is the perquisite of the carman. "It's luck as is everything;" said one carman. "There was a mate of mine as hadn't not no better work nor me, once found an old silver coin, like a bad half-crown, as a gen'lman he knowed gave him five good shillings for, and he found a silver spoon as fetched 1*s.* 9*d.*, in one week, and that same week on the same ground *I* got nothing but five bad ha'pennies. I once worked in the City where the Sun office now is, just by the Hall of Commerce in Threadneedle-street, and something was found in the Hall as now is; it was a French church once; and an old gent gave us on the sly 1*s.* a day for beer, to show him or tell him of anything we

turned up queer. We did show him things as we thought queer, and they looked queer, but he all'us said 'Chi-ish,' or 'da-amn.' From what I've heard him say to another old cove as sometimes was with him, they looked for something Roman Catholic." My informant no doubt meant "Roman," as in digging the foundations of the Hall of Commerce a tesselated Roman pavement was found at a great depth.

Among these workmen are *no Trade Societies, no Benefit or Sick-Clubs*, and, indeed, no measures whatever for the upholding of accustomed wages, or providing "for a rainy day," unless individually. If a rubbish-carter be sick, the men in the same employ, whatever their number, 10 or 40, contribute on the Saturday evenings 6*d.* each, towards his support, until the patient's convalescence. There are no Houses of Call.

The *payment is in the master's yard* on the Saturday evening, and always in money. There are no drawbacks, unless for any period during the hours of regular labour, when a man may have been absent from his work. Fines there are none, except in large establishments among the carmen where many horses are kept, and then, if a man do not keep his regular stable-hours in the mornings, especially the Sunday mornings, he is fined 6*d.* These fines are spent by the carmen generally, and most frequently in beer.

The *usual way of applying for work* is to call at the yards or premises, or, more frequently, to take a round in the districts where it is known that buildings or excavations are being carried on, to inquire of the men if a hand be wanted. Sometimes a foreman may be there who has authority to "put on" new hands; if not, the applicant, with the prospect of an engagement in view, calls upon any party he may be directed to. Several men told me that when they were engaged nothing was said about character. The employers seem to be much influenced by the applicant's appearance.

I must now give a brief description of the rubbish-carter, and the scene of his labours.

Any one who observes, and does not merely see, the labour of the rubbish-carter, will have been struck with the stolid indifference with which these men go about their work, however much the scene of their labours, from its historical associations, may interest the better informed. So it was when the rubbish carters were employed in removing the ruins of the old Houses of Parliament, and of that portion of the Tower which suffered from the ravages of the fire; and so it would be if they were directed to-morrow to commence the demolition and rubbish-carting of Westminster Abbey, the Temple Church, or St. Paul's, even in their present integrity.

Sometimes the scene of the rubbish-carter's industry presents what may be called a "piteous aspect." This was not long ago the case in Cannon-street, City, and the adjacent courts and alleys; when the houses had been cleared of their furniture, the windows were removed (giving the house what may be styled a "blind" look); most of the doors had been taken away, as well as some of the floors. Large cyphers, scrawled in whitewash on the walls and woodwork, intimated the different "lots," and all spoke of desertion; the only moving thing to be seen, perhaps, was some flapping paper, torn from the sides of a room and which fluttered in the wind.

A scene of exceeding bustle follows the apparent desolateness of the premises. When the whole has been disposed of to the several purchasers, the further and final work of demolition begins. Baskets filled with the old bricks are rapidly lowered by ropes and pulleys into the carts below, it being the carter's business to empty them, and then up the empty baskets are drawn, as if by a single jerk. The sound of the hammer used in removing and separating the old bricks of the building, the less frequent sound of the pick-axe, the rumble of the stones and bricks into the cart, the noise of the pulleys, the shouts of the men aloft, crying "be-low there!" the half-articulate exclamations of the carters choked with dust, form a curious medley of noises. The atmosphere is usually a cloud of dust, which sticks to the men's hair like powder. The premises are boarded round, and if adjoining a thoroughfare the boards are closely fitted, to prevent the curious and the loiterers obstructing the current of passengers. The work within is confined to the labourers; "no persons admitted except on business" seems a rule rigidly enforced. The only men inside who appear idle are the over-lookers, or surveyors. They stand with their hands in their breeches' pockets; and a stranger to the business might account them uninterested spectators, but for the directions they occasionally give, now quietly, and now snappishly; while the Irishmen show an excessive degree of activity, the assumption of which never deceives an overlooker.

From twelve to one is the customary dinner-hour, and then all is quiet. On visiting some new buildings at Maida-hill, I found seven men, out of about 30, all fast asleep in the nooks and corners of the piles of bricks and rubbish, the day being fine. The others were eating their dinners at the public-houses or at their own homes.

In the progress of pulling down, the work of removal goes on very rapidly where a strong force is employed—the number varying from about twelve to 30 men. A four-storied house is often pulled down to its basement, and the contents of the walls, floors, &c., removed, in ten days or a fortnight.

As the work of demolition goes on, the rubbish-carter loads the cart with the old bricks, mortar, and refuse which the labourers have displaced. In some places, where a number of buildings is being removed at the same time, an inclined plane or road is formed by the rubbish-carters, up and down which the horses and vehicles can proceed. Until such means of carriage have been employed, the rubbish from the interior foundation is often shot in a mound within the premises, and carried off when the way has been formed, excepting such portion as may be retained for any purpose.

In hot weather, many of the rubbish-carters in the fair trade work in their shirts, a broad woollen belt being strapped round the waist, which, they

Original from HARVARD UNIVERSITY

say, supports "the small of the back" in their frequent bending and stooping. Some wear woollen night-caps at this work when there is much dust; and nearly all the men in the honourable trade wear the "strong men's" half-boots, laced up in the front, as the best protectors of the feet from the intrusion of rubbish.

In the cold weather, the rubbish-carter's working dress is usually a suit of strong drab-white fustian. The suit comprises a jacket with two large pockets. The cost of such a suit, new, at a slop-tailor's, is from 28*s*. to 35*s*.; from a good shop, and of better materials, 40*s*. to 55*s*. Some prefer stout corduroy to fustian trowsers; and some work in short smock-frocks.

Having thus shown the nature of the work, the class of men employed, and the amount of remuneration, I proceed to describe the characteristics of the rubbish-carters employed by the honourable masters; I will then describe the state of the labourers who are *casually* rather than *constantly* employed; and finally speak of the condition and habits of the lower-paid workers under the cheap masters.

The Ability to Read and Write.—I think I heard of fewer instances of defective education among the rubbish-carters than among other classes of unskilled labourers. The number of men who could read and not write, I found computed at about one-half. It appears that the children of these men are very generally sent to school, which is certainly a healthful sign as to the desire of the parents to do justice to their offspring. As among other classes, I met with uneducated men who had exaggerated notions of the advantages of the capability of reading and writing, and men who possessed such capability representing it as a worthless acquirement.

The *majority of the Rubbish-Carters* in the honourable trade *are*, I am informed, *really married men*, and have families "born in lawful wedlock." One decent and intelligent man, to whom I was referred, said (his wife being present and confirming his statement): "I don't know how it is, sir, but they say one scabbed sheep will affect a flock." "Oh! it's dreadful," said the wife; "but some way it seems to run in places. Now, we've lived among people much in our own way of life in Clerkenwell, and Pentonville, and Paddington. Well, we've reason to believe, that there wasn't much living together unmarried in Clerkenwell or Pentonville, but a goodish deal in Paddington. I don't know why, for they seemed to live one with another, just as men do with their wives. But if there's daughters, sir, as is growing up and gets to know it, as they're like enough to do, ain't it a bad example? Yes, indeed," said the wife, "and I'm told they call going together in that bad way—they ought all to be punished—without ever entering a church or chapel, getting 'ready married.'" I inquired if they were not perhaps married quietly at the Registrar's office? "O, that," said Mrs. B——, "ain't like being married at all. *I* would never have consented to such a way, but I'm pretty certain they don't as much as do that. No, sir," (in answer to another inquiry), "I hope, and think, it ain't so bad among young couples as it was, but its bad enough as it is, God he knows." The proportions of Wedlock and Concubinage I could not learn, for the woman, I was assured, always took the man's name; and both man and woman, unless in their cups or their quarrels, declared they were man and wife, only there was no good in wasting money to get their "marriage lines" all for no use.

The Politics of the rubbish-carters are, I am assured by some of the best informed among them, of no fixity, or principle, or inclination whatever, as regards one-half of the entire body; and that the other half, whether ignorant or not, are Chartists, the Irish generally excepted; and they, I understood, as I had learned on previous occasions, had no political opinions, unless such as were entertained by their priests. Strong, rude, and ignorant as many of these carters are, I am told that few of them took part in any public manifestation of opinion, or in any disturbance, unless they were out of work. "I think I know them well," one of their body said to me, "and as long as they have pretty middling of work, it'll take a very great thing indeed to move 'em. If they was longish out of work and felt a pinch, very likely they'd be found ready for anything."

With respect to Free Trade, I am told that these men sometimes discuss it, and formerly discussed it far more frequently among themselves, but that it was not above one in a dozen, and of the better sort only, who cared to talk about it either now or then. There seems no doubt that the majority, whether they understand its principles and working or not, are favourable to it; I may say, from all I could learn, that the *great* majority are. I heard of one rubbish-carter, formerly a small farmer, who left London for some other employment, in the spring, contending, and taking pains to enforce his conviction, that Free Trade would ruin the best interests of rubbish-carters, as year by year there would be more agricultural labourers resorting to the great towns to look for such work as rubbish-carting, for every farmer would employ more Irish labourers at his own terms, and even the 8*s*. a week, the extent of the earnings of the agricultural labourers in some parishes, would be undersold by the Irish. Last winter, he said, very many countrymen came to London, and would do so the next, and more and more every year, and so make labour cheaper.

As far as I could extend my inquiries and observations, this man's arguments—although I cannot say I heard any one offer to controvert them—were not considered sound, nor his facts fully established. There were certainly great numbers of good hands out of employment last winter, and many new applicants for work; "but buildings," I was told by a carman, "are of course always slacker carried on in the winter. Now, this year, so far (beginning of October), things seem to promise pretty well in our business, and so if it's good this winter and was bad the last, why, as there's the same Free Trade, it seems as if it had nothing to do with it. There's not so

much building going on now as there was a few years ago, but trade's steadier, I think."

Other rubbish-carters, in the best trade, said that they had found little difference for six or eight years, only as bread was cheaper or dearer; and, if Free Trade made bread cheap, no man ought to say a word against it, "no matter about anything else." Of course I give these opinions as they came to me.

As to Food, these labourers, when in full work, generally live what they consider *well;* that is, they eat meat and have beer to their meals every day. Three of them told me that they could not say what their living cost separately, as they took all their meals at home with their families, their wives laying out the money. One couple had six children, and the husband said they cost him about 17*s.* a week in food, or about 2*s.* 6*d.* per head, reckoning a pint of beer a day for himself, and not including the youngest, which was an infant at the breast. The father earned 22*s.* weekly, and the eldest child, a boy, 3*s.* 6*d.* a week for carrying out and collecting the papers for a news'-agent. The wife could earn nothing, although an excellent washerwoman, the cares of her family occupying her whole time. She always had "the cold shivers," she said, "if ever she thought of John's being out of work, but he was a steady man, and had been pretty fortunate." If these men were engaged on a job at any distance, they sometimes breakfasted before starting, or carried bread and butter with them, and eat it to a pint of coffee if near enough to a coffee-shop, but in some places they were not near enough. Their dinners they carried with them, generally cold meat and bread, in a basin covered with a plate, a handkerchief being tied round it so as to keep the plate firm and afford a hold to the bearer. "It's not always, you see, sir," said a rubbish-carter, "that there's a butcher's shop near enough to run to and buy a bit of steak and get it dressed at a tap-room fire, just for buying a pint of beer, and have a knife and fork, and a plate, and salt found you into the bargain, and pepper and mustard too, if you'll give the girl or the man 1*d.* a week or so. But we're glad to get a good cold dinner. O, as to beer, it would be a queer out-of-the-way place indeed where a landlord didn't send out a man to a building with beer." One single man, who told me he was only a small eater, gave me the following as his *daily* bill of fare, as he rarely took any meals at his lodgings:

	s.	*d.*
Half-quartern loaf	0	2¾
Butter	0	1
Coffee (twice a day)	0	3
Eleven o'clock beer, sometimes a pint and sometimes half-a-pint, but often obtained as a perquisite . . . (average)	0	1½
½ lb. of beef steak, or a chop, or four or five pennyworth of cold meat from a cook-shop . . . (average)	0	5
Potatoes	0	1
Dinner beer	0	2
Bread and cheese and beer for supper .	0	4
	1	8¼

This was the average cost of his daily food, while on Sundays he generally paid 1*s.* 6*d.* for breakfast and tea, and a good dinner off a hot joint with baked potatoes from the oven, along with the family and other lodgers. He had a good walk every Sunday morning, he said, but liked to sleep away the afternoon. He found his own Sunday beer, costing 4*d.* dinner and supper, but he didn't eat anything at supper, as he wasn't inclined after resting all day, and so his weekly expenses in food were:—

	s.	*d.*
Six working days, at 1*s.* 8¼*d.* a day	10	1½
Sunday	1	10
Week's food	11	11½

To this, in the way of drink or luxuries, I might add, the carter said, 2*d.* a day for gin (although he wasn't a drinker and was very seldom tipsy), "for I treat a friend to a quartern one day and may-be he stands treat the next." Also 4*d.* for Sunday gin, as he and the other men took a glass just before dinner for an appetite, and he took one after dinner to send him asleep. Add, too, 3*d.* a week for tobacco. In all 1*s.* 7*d.*, which swells the weekly cost of eating, drinking, and smoking to 13*s.* 6½*d.* His washing was 4*d.* a week (he washed his working jacket and trowsers himself), his rent 2*s.* 6*d.* for a bed to himself; so that, 16*s.* 4½*d.* being spent out of an earning of 18*s.*, he had but 1*s.* 5½*d.* a week left for his clothes, shoes, &c. If he wanted a shilling or two for anything, he said, he knocked off his supper, and then nothing was allowed in his reckoning for perquisites, so he might be 2*s.* in hand, at least 2*s.*, every week in a regular way of living. This man expressed his conviction that no man, who had to work hard, could live at smaller cost than he did. That numbers of men did so, he admitted, but he "couldn't make it out." The two ways of living which I have described may be taken as the modes prevalent among this class of labourers, who seek to live "comfortably." Others who "rough it" live at less cost, dining, for instance, off a pennyworth of pudding and half a pint of beer.

I ascertained that among the rubbish-carters, *those most frequently attendant on public worship are the Irish Roman Catholics,* and such Englishmen as had been agricultural labourers in rural parishes, and had been reared in the habit of church-going; a habit in which, but not without many exceptions, they still persevere. Among London-bred labourers such habits are rarely formed.

The abodes of the better description of rubbish-carters are not generally in those localities which are crowded with the poor. They reside in the streets off the Edgeware and Harrow-roads, as building has been carried on to a very great extent in Westbourne, Maida-hill, &c.; in Portland-town, Camden-town, Somers-town, about King's-cross; in Islington, Pentonville, and Clerkenwell; off the Commercial and Mile-end-roads; in Walworth, Camberwell, Kennington, and Newington; and, indeed, in all the quarters where building has been prosecuted on an extensive

scale. I was in some of their apartments, and found them tidy and comfortable-looking: one was especially so. Some stone-fruit on the mantel-shelf shone as if newly painted, and the fender and fire-irons glittered from their brightness to the fire of the small grate. The husband, however, was in good earnings, and the wife cleared about 5*s.* weekly on superior needlework. There was one thing painful to observe—the contrast between the robust and sun-burnt look of the husband, and the delicate and pallid, not to say sickly, appearance of the wife. The rents for unfurnished apartments vary from 2*s.* to 5*s.*, but rarely the latter, unless the wife take in a little washing. I heard of some at 2*s.*, but very few; 2*s.* 6*d.* to 3*s.* 6*d.* are common prices.

I heard of no partiality for amusements among the rubbish-carters, beyond what my informant spoke of—a visit to the play. Some, I was told, but principally the younger men, never missed going to a fair, which was not too far off. I think not quite one-half of those I spoke to, with the best earnings, had been to the Exhibition. Of the worst paid, I am told, not one in 50 went; one man told me that he had no amusements but his pipe and his beer. Some of them, I was assured, drank half a gallon of beer in a day, but at intervals, so as not to be intoxicated. "A hand at cribbage" is a favourite public-house game among a few of these men; but not above one in half-a-dozen, I was assured, "knew the cards," and not one in two dozen played them.

These, then, are the characteristics of the labouring rubbish-carters employed in the honourable trade.

A fine-looking man, upwards of six feet in stature and of proportionate bulk, with so smart a set to his bushy whiskers, and a look of such general tidiness (after he had left off work in the evening), that he might have been taken for a life-guardsman had it not been for a slight slouch of the shoulders, and a very unmilitary gait, gave me the following account:—

"I 'm a London man," he said, "and though I 'm not yet 25, I 've kept myself for the last five years. I 've worked at rubbish-carting and general ground-work (digging for pipe-laying, &c.,) as we nearly all do, but mainly at rubbish-carting, and I 'm at that now. My friends are in the same line, so I helped them: I was big enough, and was brought up that way. O, yes, I can read and write, but I haven't time, or very seldom, to read anything but a newspaper now and again. I 'm a carman now, and have a very good master. I 've served him, more or less, for three years. I have had 25*s.* a week, and I have had 29*s.*, but that included over-work. Two hours extra work a day makes an extra day in the week, you see, sir. O, yes, I might have saved money, and I 'm trying to save 25*l.* now to see if I can't raise a horse and cart, and begin for myself in a small way, general jobbing. I 've been used to cart mould, and gravel, and turf for gentlemen's gardens, or when gardens have been laid out in new buildings, as well as rubbish, for the same master. Last year I set to work in hard earnest in the same way, and this is where it is that always stops me. Mr. —— [his employer] is very busy now, and things look pretty well about here [Camden-town], but I don't know how it is in other parts. It was the same last year, but trade fell off in the winter, and I was three months out of work. O, that 's a common case, especial with young men, for of course the old hands has the preference. That 's where it is, you see, sir; it 's a *uncertain* trade. It 's always that new shoes is wanted, but it ain't always new houses. My money all went, and then all my things went to the pawn, and when I got fairly to work again, I had a shirt and a shilling left, and owed some little matters. I 'd saved well on to 50*s.*, and could have gone on saving, but for being thrown out. Then, when you get into regular wages again, there 's your uncle to meet, and there 's always something wanted—a pair of half-boots, or a new shirt, or a new tool, or something; so one loses heart about it, and I can't abear not to appear respectable.

"I pay 2*s.* a week for my lodging, but it 's only for half a bed. The house is let out that way to single men like me, so each bed brings in 4*s.* a week. There 's two beds in the room where I sleep; I don't know how many in all. Why, yes, it 's a respectable sort of a place, but I don't much like it. There 's plenty such places; some 's decent and some 's not. Oh, certainly, a place of your own 's best, if it 's ever so humble, but it wouldn't suit a man like me. I may work one week at Paddington, and the next at Bow, and if I had a furnished room at Paddington, what good would it be if I went to work at Bow? Only the bother and expense of removing my sticks again and again. O, people that find lodgings for such as me, know that well enough, and makes a prey of us, of course.

"I take my meals at a public-house or a coffee-shop. O yes, I live well enough. I have meat every day to dinner; a man like me must keep up his strength, and you can't do that without good meat. It 's all nonsense about vegetables and all that, as if men's stomachs were like cows'. I have bread and butter and tea or coffee for breakfast and tea, sometimes a few cresses with it just to sweeten the blood, which is the proper use of vegetables. A pint of beer or so for supper, but I don't care about supper, though now and then I take a bit of bread and cheese with a nice fresh onion to it. Well, I 'm sure I can't say what I lay out in my living in a week; sometimes more and sometimes less. I keep no account; I pay my way as I go on. Some weeks when I get my Saturday night's wage, I have from 2*s.* 6*d.* to 6*s.* 6*d.* left from last Saturday night's money, but that 's only when I 've had nothing to lay out beyond common. Now, last week I was 4*s.* 9*d.* to the good, and this week I shall be about the ditto; but then I want a waistcoat and a silk handkerchief for my neck for Sunday wear; so I must draw on my Saturday night. There 's a gentleman takes care of my money for me, and I carry him what I have over in a week, and he takes care of it for me. I did a good deal of

work about his houses—he has a block of them—and his own place, and I've gardened for him; and from what I've heard, my money's safer with him than with a Savings' Bank. When I want to draw he likes to be satisfied what it's for, and he's lent me as much as 33*s.* in different sums, when I was hard up. He's what I call a real gentleman. He says if I ever go to him tipsy to draw, and says it quite solemn like, he'll take me by the scruff of the neck and kick me out; though [laughing] he can't be much above five foot, and has gray hairs, and seems a feeble sort of a man, I mean of a gentleman. He enters all I pay in a book. Here it is, sir, for this year, if you'd like to see it. I wasn't able to put anything by for a goodish bit. I lost my book once, but I knew how much, and so did Mr. ——, and he put it down in a lump.

		£	*s.*	*d.*

"If I can't save a little to start myself on when I'm a single man, I can't ever after, I fancy; so I'm a trying.

"No, my expenses, over and above my living and lodging and washing, and all that, ain't heavy. Yes, I'm very fond of a good play, very. Some galleries is 6*d.*, and some 3*d*; but then there's refreshment and that, so it costs 1*s.* a time. Perhaps I go once a week, but only in autumn and winter, when nights get long, and we leave work at half-past five. The last time I was at the play was at the Marylebone, but there was some opera pieces that don't suit me; such stuff and nonsense. I like something very lively, or else a deep tragedy. Sadler's Wells is the place, sir. I mean to go there to-morrow night. Yes, I'm very fond of the pantomimes. Concerts I've been at, but don't care for them. They're as dear at 2*d.* as an egg a penny, and an egg's only a bite.

"Well, I've gone to church sometimes, but a carman hasn't time, for he has his horses to attend to on Sunday mornings, and that uses up his morning. No, I never go now. Work must be done. It ain't my fault. I'm sure, if I could have my wish, I'd never do anything on a Sunday.

"Yes, there's far too many as undersells us in work. I know that, but I don't like to think about them or to talk about them." [He seemed desirous to ignore the very existence of the scurf rubbish-carters.] "They're Irish many of them. They're often quarrelsome and blood-thirsty, but I know many decent men among the Irishmen in our gangs. There's good and bad among them, as there is among the English. There's very few of the Irish that are carmen; they haven't been much used to horses.

"I have done a little as a nightman when I worked for Mr. ——. He was a parish contractor, and undertook such jobs, and liked to put strong men on to them. I didn't like it. I can't think it's a healthy trade. I can't say, but I heard it represented, that in this particular calling there was a great deal of under-contracting going on when the railway undertakings generally received a severe check, and when a great number of hands were thrown out of employment, and sought employment in rubbish-carting generally, and apart from railway-work. These hands suffered greatly for a long time. The tommy-shops and the middle-man system were enough to swallow the largest amount of railway wages, so that very few had saved money, and they were willing to work for very low wages. A good many of these people went to endeavour to find work at the large new docks being erected at Great Grimsby, near Boston, in Lincolnshire. Some of the more prudent were able to raise the means of emigrating, and from one cause or other the pressure of this surplus labour among rubbish-carters and excavators, as regards the metropolis, became relieved."

Of Casual Labour in General, and that of the Rubbish-Carters in Particular.

The subject of casual labour is one of such vast importance in connection with the welfare of a nation and its people, and one of which the causes as well as consequences seem to be so utterly ignored by economical writers and unheeded by the public, that I purpose here saying a few words upon the matter in general, with the view of enabling the reader the better to understand the difficulties that almost all unskilled and many skilled labourers have to contend with in this country.

By *casual* labour I mean such labour as can obtain only *occasional* as contradistinguished from *constant* employment. In this definition I include all classes of workers, literate and illiterate, skilled and unskilled, whose professions, trades, or callings expose them to be employed temporarily rather than continuously, and whose incomes are in a consequent degree fluctuating, casual, and uncertain.

In no country in the world is there such an extent, and at the same time such a diversity, of casual labour as in Great Britain. This is attributable to many causes—commercial and agricultural, natural and artificial, controllable and uncontrollable.

I will first show what are the causes of casual labour, and then point out its effects.

The causes of casual labour may be grouped under two heads:—

I. *The Brisk and Slack Seasons, and Fit Times*, or periodical increase and decrease of work in certain occupations.

II. *The Surplus Hands* appertaining to the different trades.

First, as to the briskness or slackness of employment in different occupations. This depends in different trades on different causes, among which may be enumerated—

A. The weather.

B. The seasons of the year.
C. The fashion of the day.
D. Commerce and accidents.

I shall deal with each of these causes *seriatim*.

A. The labour of thousands is influenced by the *weather;* it is suspended or prevented in many instances by stormy or rainy weather; and in some few instances it is promoted by such a state of things.

Among those whose labour cannot be executed on *wet days*, or executed but imperfectly, and who are consequently deprived of their ordinary means of living on such days, are—paviours, pipe-layers, bricklayers, painters of the exteriors of houses, slaters, fishermen, watermen (plying with their boats for hire), the crews of the river steamers, a large body of agricultural labourers (such as hedgers, ditchers, mowers, reapers, ploughmen, thatchers, and gardeners), costermongers and all classes of street-sellers (to a great degree), street-performers, and showmen.

With regard to the degree in which agricultural (or indeed in this instance woodland) labour may be influenced by the weather, I may state that a few years back there had been a fall of oaks on an estate belonging to Col. Cradock, near Greta-bridge, and the poor people, old men and women, in the neighbourhood, were selected to strip off the bark for the tanners, under the direction of a person appointed by the proprietor: for this work they were paid by the basket-load. The trees lay in an open and exposed situation, and the rain was so incessant that the "barkers" could scarcely do any work for the whole of the first week, but kept waiting under the nearest shelter in the hopes that it would "clear up." In the first week of this employment nearly one-third of the poor persons, who had commenced their work with eagerness, had to apply for some temporary parochial relief. A rather curious instance this, of a parish suffering from the casualty of a very humble labour, and actually from the attempt of the poor to earn money, and do work prepared for them.

On the other hand, some few classes may be said to be benefited by the rain which is impoverishing others: these are cabmen (who are the busiest on *showery* days), scavagers, umbrella-makers, clog and patten-makers. I was told by the omnibus people that their vehicles filled better in hot than in wet weather.

But the labour of thousands is influenced also by the *wind;* an easterly wind prevailing for a few days will throw out of employment 20,000 dock labourers and others who are dependent on the shipping for their employment; such as lumpers, corn-porters, timber-porters, ship-builders, sail-makers, lightermen, watermen, and, indeed, almost all those who are known as 'long-shoremen. The same state of things prevails at Hull, Bristol, Liverpool, and all our large ports.

Frost, again, is equally inimical to some labourers' interests; the frozen-out market-gardeners are familiar to almost every one, and indeed all those who are engaged upon the land may be said to be deprived of work by severely cold weather.

In the weather alone, then, we find a means of starving thousands of our people. Rain, wind, and frost are many a labourer's natural enemies, and to those who are fully aware of the influence of "the elements" upon the living and comforts of hundreds of their fellow-creatures, the changes of weather are frequently watched with a terrible interest. I am convinced that, altogether, a wet day deprives not less than 100,000, and probably nearer 200,000 people, including builders, bricklayers, and agricultural labourers, of their ordinary means of subsistence, and drives the same number to the public-houses and beer-shops (on this part of the subject I have collected some curious facts); thus not only decreasing their income, but positively increasing their expenditure, and that, perhaps, in the worst of ways.

Nor can there be fewer dependent on the winds for their bread. If we think of the vast number employed either directly or indirectly at the various ports of this country, and then remember that at each of these places the prevalence of a particular wind must prevent the ordinary arrival of shipping, and so require the employment of fewer hands; we shall have some idea of the enormous multitude of men in this country who can be starved by "a nipping and an eager air." If in London alone there are 20,000 people deprived of food by the prevalence of an easterly wind (and I had the calculation from one of the principal officers of the St. Katherine Dock Company), surely it will not be too much to say that throughout the country there are not less than 50,000 people whose living is thus precariously dependent.

Altogether I am inclined to believe, that we shall not be over the truth if we assert there are between 100,000 and 200,000 individuals and their families, or half a million of people, dependent on the elements for their support in this country.

But this calculation refers to those classes only who are deprived of a certain number of *days'* work by an alteration of the weather, a cause that is essentially *ephemeral* in its character. The other series of natural events influencing the demand for labour in this country are of a more *continuous* nature—the stimulus and the depression enduring for weeks rather than days. I allude to the *second* of the four circumstances above-mentioned as inducing briskness or slackness of employment in different occupations, viz.:—

B. The seasons.

These are the seasons of the year, and not the arbitrary seasons of fashion, of which I shall speak next.

The following classes are among those exposed to the uncertainty of employment, and consequently of income, from the above cause, since it is only in particular seasons that particular works, such as buildings, will be undertaken, or that open-air pleasure excursions will be attempted: carpenters, builders, brickmakers, painters, plasterers, paper-hangers, rubbish-carters, sweeps, and riggers and lumpers, the latter depending mainly

on the arrival of the timber ships to the Thames (and this, owing to the ice in the Baltic Sea and in the river St. Lawrence, &c., takes place only at certain seasons of the year), coal-whippers and coal-porters (the coal trade being much brisker in winter), market-porters, and those employed in summer in steam-boat, railway, van, and barge excursions.

Then there are the casualties attending agricultural labour, for, although the operations of nature are regular "even as the seed time follows the harvest," there is, almost invariably, a smaller employment of labour after the completion of the haymaking, the sheep-shearing, and the grain-reaping labours.

For the hay and corn harvests it is well known that there is a periodical immigration of Irishmen and women, who clamour for the *casual* employment; others, again, leave the towns for the same purpose; the same result takes place also in the fruit and pea-picking season for the London green-markets; while in the winter such people return some to their own country, and some to form a large proportion of the casual class in the metropolis. A tall Irishman of about 34 or 35 (whom I had to see when treating of the religion of the street Irish) leaves his accustomed crossing-sweeping at all or most of the seasons I have mentioned, and returns to it for the winter at the end of October; while his wife and children are then so many units to add to the casualties of the street sale of apples, nuts, and onions, by overstocking the open-air markets.

The autumnal season of hop-picking is the grand rendezvous for the vagrancy of England and Ireland, the stream of London vagrancy flowing freely into Kent at that period, and afterwards flowing back with increased volume. Men, women, and children are attracted to the hop harvest. The season is over in less than a month, and then the casual labourers engaged in it (and they are nearly all casual labourers) must divert their industry, or their endeavours for a living, into other channels, swelling the amount of casualty in unskilled work or street-trade.

Numerically to estimate the influence of the seasons on the labour-market of this country is almost an overwhelming task. Let us try, however: there are in round numbers one million agricultural labourers in this country; saying that in the summer four labourers are employed for every three in the winter, there would be 250,000 people and their families, or say 1,000,000 of individuals, deprived of their ordinary subsistence in the winter time; this, of course, does not include those who come from Ireland to assist at the harvest-getting—how many these may be I have no means of ascertaining. Added to these there are the natural vagabonds, whom I have before estimated at another hundred thousand (see p. 408, vol. i.), and who generally help at the harvest work or the fruit or hop-picking.

Then there are the carpenters, who are 163,000 in number; the builders, 9200; the brickmakers, 18,000; the painters, 48,200; the coal-whippers, 9200; the coal-miners, 110,000; making altogether 350,000 people, and estimating that for every four hands employed in the brisk season, there are only three required in the slack, we have 80,000 more families, or 300,000 people, deprived of their living by the casualty of labour; so that if we assert that there are, at the least, including agricultural labourers, 1,250,000 people thus deprived of their usual means of living, we shall not be very wide of the truth.

The next cause of the briskness or slackness of different employments is—

C. Fashion.

The London fashionable season is also the parliamentary season, and is the "briskest" from about the end of February to the middle of July.

The workmen most affected by the aristocratic, popular, or general fashions, are—

Tailors, ladies' habit-makers, boot and shoemakers, hatters, glovers, milliners, dress-makers, mantua-makers, drawn and straw bonnet-makers, artificial flower-makers, plumassiers, stay-makers, silk and velvet weavers, saddlers, harness-makers, coach-builders, cabmen, job-coachmen, farriers, livery stable keepers, poulterers, pastry-cooks, confectioners, &c., &c.

The above-mentioned classes may be taken, according to the Occupation Abstract of the last Census, at between 500,000 and 600,000; and, assuming the same ratio as to the difference of employment between the brisk and the slack seasons of the trades, or, in other words, that 25 per cent. less hands are required at the slack than at the brisk time of these trades, we have another 150,000 people, who, with their families, may be estimated altogether at say 500,000, who are thrown out of work at a certain season, and have to starve on as best they can for at least three months in the year.

The last-mentioned of the causes inducing briskness or slackness of employment are—

D. Commerce and Accidents.

Commerce has its periodical fits and starts. The publishers, for instance, have their season, generally from October to March, as people read more in winter than in summer; and this arrangement immediately effects the printers and bookbinders; there is no change, however, as regards the newspapers and periodicals. Again, the early importation to this country of the new foreign fruits gives activity to the dock and wharf labourers and porters and carmen. Thus the arrival here, generally in autumn, of the nut, chestnut, and grape (raisin) produce of Spain; of the almond crops in Portugal, Spain, and Barbary; the date harvest in Morocco, and different parts of Africa; the orange gathering in Madeira, and in St. Michael's, Terceira, and other islands of the Azores; the fig harvest from the Levant; the plum harvest of the south of France; the currant picking of Zante, Ithaca, and other Ionian Islands;—all these events give an activity, as new fruit is always most saleable, to the traders in these southern productions; and more shopmen, shop-porters, wharf labourers, and assistant lightermen are required—casually required—for the time.

I was told by a grocer, with a country connec-

Original from HARVARD UNIVERSITY

tion, and in a large way of business, that for three weeks or a month before Christmas he required the aid of four fresh hands, a shopman, an errand-boy, and two porters (one skilled in packing), for whom he had nothing to do after Christmas. If in the wide sweep of London trade there be 1000 persons, including the market salesmen, the retail butchers, the carriers, &c., so circumstanced, then 4000 men are *casually* employed, and for a very brief time.

The brief increase of the carrying business generally about Christmas, by road, water, or railway, is sufficiently indicated by the foregoing account.

The employment, again, in the cotton and woollen manufacturing districts may be said to depend for its briskness on commerce rather than on the seasons.

Accidents, or extraordinary social events, promote casual labour and then depress it. Often they depress without having promoted it.

During the display of the Great Exhibition, there were some thousands employed in the different capacities of police, packing, cleaning, porterage, watching, interpreting, door-keeping and money-taking, cab-regulating, &c.; and after the close of the Exhibition how many were retained? Thus the Great Exhibition fostered casual, or uncertain labour. Foreign revolutions, moreover, affect the trade of England: speculators become timid and will not embark in trade or in any proposed undertaking; the foreign import and export trades are paralysed; and fewer clerks and fewer labourers are employed. Home political agitations, also, have the same effect; as was seen in London during the corn-law riots, about 35 years ago (when only eight members of the House of Commons supported a change in those laws); the Spafields riots in 1817; the affair in St. Peter's-field, Manchester, in 1819; the disturbances and excitement during the trial of Queen Caroline, in 1820-1, and the loss of life on the occasion of her funeral in 1821; the agitation previously to the passing of the Reform Bill had a like effect; the meeting on Kennington Common on the 10th of April;—in all these periods, indeed, employment decreased. Labour is affected also by the death of a member of the royal family, and the hurried demand for general mourning, but in a very small degree to what was once the case. A West-End tailor employing a great number of hands did not receive a single order for mourning on the death of Queen Adelaide; while on the demise of the Princess Charlotte (in 1817) thousands of operative tailors, throughout the three kingdoms, worked day and night, and for double wages, on the general mourning. Gluts in the markets, an increase of heavy bankruptcies and "panics," such as were experienced in the money market in 1825-6, and again in 1846, with the failure of banks and merchants, likewise have the effect of augmenting the mass of casual labour; for capitalists and employers, under such circumstances, expend as little as possible in wages or employment until the storm blows over. Bad harvests have a similar depressing effect.

There are also the consequences of changes of taste. The abandonment of the fashions of gentlemen's wearing swords, as well as embroidered garments, flowing periwigs, large shoe-buckles, all reduced able artizans to poverty by depriving them of work. So it was, when, to carry on the war with France, Mr. Pitt introduced a tax on hair powder. Hundreds of hair-dressers were thrown out of employment, many persons abandoning the fashion of wearing powder rather than pay the tax. There are now city gentlemen, who can remember that when clerks, they had sometimes to wait two or three hours for "their turn" at a barber's shop on a Sunday morning; for they could not go abroad until their hair was dressed and powdered, and their queues trimmed to the due standard of fashion. So it has been, moreover, in modern times in the substitution of silk for metal buttons, silk hats for stuff, and in the supersedence of one material of dress by another.

These several causes, then, which could only exist in a community of great wealth and great poverty have rendered, and are continually rendering, the labour market uncertain and over-stocked; to what extent they do and have done this, it is, of course, almost impossible to say *precisely;* but, even with the strongest disposition to avoid exaggeration, we may assert that there are in this country no less than 125,000 families, or 500,000 people, who depend on the weather for their food; 300,000 families, or 1,250,000 people, who can obtain employment only at particular seasons; 150,000 more families, or 500,000 people, whose trade depends upon the fashionable rather than the natural seasons, are thrown out of work at the cessation of the brisk time of their business; and, perhaps, another 150,000 of families, or 500,000 people, dependent on the periodical increase and decrease of commerce, and certain social and political accidents which tend to cause a greater or less demand for labour. Altogether we may assert, with safety, that there are at the least 725,000 families, or three millions of men, women, and children, whose means of living, far from being certain and constant, are of a precarious kind, depending either upon the rain, the wind, the sunshine, the caprice of fashion, or the ebbings and flowings of commerce.

But there is a still more potent cause at work to increase the amount of *casual* labour in this country. Thus far we have proceeded on the assumption that at the brisk season of each trade there is full employment for all; but this is far from being the case in the great majority, if not the whole, of the instances above cited. In almost all occupations there is in this country a *superfluity of labourers*, and this alone would tend to render the employment of a vast number of the hands of a casual rather than a regular character. In the generality of trades the calculation is that one-third of the hands are fully employed, one-third partially, and one-third unemployed throughout the year. This, of course, would be the case if there were twice too many work-people; for suppose the number of work-people in

a given trade to be 6000, and the work sufficient to employ (fully) only half the quantity, then, of course, 2000 might be occupied their whole time, 2000 more might have work sufficient to occupy them half their time, and the remaining 2000 have no work at all; or the whole 4000 might, on the average, obtain three months' employment out of the twelve; and this is frequently the case. Hence we see that a surplusage of hands in a trade tends to change the employment of the great majority from a state of constancy and regularity into one of casualty and precariousness.

Consequently it becomes of the highest importance that we should endeavour to ascertain what are the circumstances inducing a surplusage of hands in the several trades of the present day. A *surplusage of hands* in a trade may proceed from three different causes, viz.:—

1. The alteration of the hours, rate, or mode of working, or else the term of hiring.
2. The increase of the hands themselves.
3. The decrease of the work.

Each of these causes is essentially distinct; in the first case there is neither an increase in the number of hands nor a decrease in the quantity of work, and yet a surplusage of labourers is the consequence, for it is self-evident that if there be work enough in a given trade to occupy 6000 men all the year round, labouring twelve hours per day for six days in the week, the same quantity of work will afford occupation to only 4000 men, or one-third less, labouring between fifteen and sixteen hours per diem for seven days in the week. The same result would, of course, take place, if the workman were made to labour one-third more *quickly*, and so to get through one-third more work in the same time (either by increasing their interest in their work, by the invention of a new tool, by extra supervision, or by the subdivision of labour, &c., &c.), the same result would, of course, ensue as if they laboured one-third longer hours, viz., one-third of the hands must be thrown out of employment. So, again, by altering the *mode or form of work*, as by producing on the large scale, instead of the small, a smaller number of labourers are required to execute the same amount of work; and thus (if the market for such work be necessarily limited) a surplusage of labourers is the result. Hence we see that the alteration of the hours, rate, or mode of working may tend as positively to overstock a country with labourers as if the labourers themselves had unduly increased.

But this, of course, is on the assumption that both the quantity of work and the number of hands remain the same. The next of the three causes, above mentioned as inducing a surplusage of hands, is that which arises from a positive *increase in the number of labourers*, while the quantity of work remains the same or increases at a less rate than the labourers; and the third cause is, where the surplusage of labourers arises not from any alteration in the number of hands, but from a positive *decrease in the quantity of work*.

These are distinctions necessary to be borne clearly in mind for the proper understanding of this branch of the subject.

In the first case both the number of hands and the quantity of work remain the same, but the term, rate, or mode of working is changed.

In the second, hours, rate, or mode of working remain the same, as well as the quantity of work, but the number of hands is increased.

And in the third case, neither the number of hands nor the hours, rate, or mode of working is supposed to have been altered, but the work only to have decreased.

The surplusage of hands will, of course, be the same in each of these cases.

I will begin with the first, viz., that which induces a surplusage of labourers in a trade by enabling fewer hands to get through the ordinary amount of work. This is what is called the "economy of labour."

There are, of course, only three modes of economizing labour, or causing the same quantity of work to be done by a smaller number of hands.

1st. By causing the men to work *longer*.

2nd. By causing the men to work *quicker*, and so get through more work in the same time.

3rd. By *altering the mode* of work, or hiring, as in the "large system of production," where fewer hands are required; or the custom of temporary hirings, where the men are retained only so long as their services are needed, and discharged immediately afterwards.

First, of that mode of economizing labour which depends on an *increase of either the ordinary hours or days for work*. This is what is usually termed over-work and Sunday-work, both of which are largely creative of surplus hands. The hours of labour in mechanical callings are usually twelve, two of them devoted to meals, or 72 hours (less by the permitted intervals) in a week. In the course of my inquiries for the *Chronicle*, I met with slop cabinet-makers, tailors, and milliners who worked sixteen hours and more daily, their toil being only interrupted by the necessity of going out, if small masters, to purchase materials, and offer the goods for sale; or, if journeymen in the slop trade, to obtain more work and carry what was completed to the master's shop. They worked on Sundays also; one tailor told me that the coat he worked at on the previous Sunday was for the Rev. Mr. ——, who "little thought it," and these slop-workers rarely give above a few minutes to a meal. Thus they toil 40 hours beyond the hours usual in an honourable trade (112 hours instead of 72), in the course of a week, or between three and four days of the regular hours of work of the six working days. In other words, two such men will in less than a week accomplish work which should occupy three men a full week; or 1000 men will execute labour fairly calculated to employ 1500 at the least. A paucity of employment is thus caused among the general body, by this system of over-labour decreasing the share of work accruing to the several operatives, and so adding to surplus hands.

Of over-work, as regards excessive labour, both in the general and fancy cabinet trade, I heard

the following accounts, which different operatives concurred in giving; while some represented the labour as of longer duration by at least an hour, and some by two hours, a day, than I have stated.

The labour of the men who depend entirely on "the slaughter-houses" for the purchase of their articles is usually seven days a week the year through. That is, seven days—for Sunday work is all but universal—each of 13 hours, or 91 hours in all; while the established hours of labour in the "honourable trade" are six days of the week, each of 10 hours, or 60 hours in all. Thus 50 per cent. is added to the extent of the production of low-priced cabinet-work, merely from "over-hours;" but in some cases I heard of 15 hours for seven days in the week, or 105 hours in all.

Concerning the hours of labour in this trade, I had the following minute particulars from a garret-master who was a chair-maker:—

"I work from six every morning to nine at night; some work till ten. My breakfast at eight stops me for ten minutes. I can breakfast in less time, but it's a rest; my dinner takes me say twenty minutes at the outside; and my tea, eight minutes. All the rest of the time I'm slaving at my bench. How many minutes' rest is that, sir? Thirty-eight; well, say three-quarters of an hour, and that allows a few sucks at a pipe when I rest; but I can smoke and work too. I have only one room to work and eat in, or I should lose more time. Altogether I labour 14¼ hours every day, and I must work on Sundays—at least 40 Sundays in the year. One may as well work as sit fretting. But on Sundays I only work till it's dusk, or till five or six in summer. When it's dusk I take a walk. I'm not well-dressed enough for a Sunday walk when it's light, and I can't wear my apron on that day very well to hide patches. But there's eight hours that I reckon I take up every week one with another, in dancing about to the slaughterers. I'm satisfied that I work very nearly 100 hours a week the year through; deducting the time taken up by the slaughterers, and buying stuff—say eight hours a week—it gives more than 90 hours a week for my work, and there's hundreds labour as hard as I do, just for a crust."

The East-end turners generally, I was informed, when inquiring into the state of that trade, labour at the lathe from six o'clock in the morning till eleven and twelve at night, being 18 hours' work per day, or 108 hours per week. They allow themselves two hours for their meals. It takes them, upon an average, two hours more every day fetching and carrying their work home. Some of the East-end men work on Sundays, and not a few either, said my informant. "Sometimes I have worked hard," said one man, "from six one morning till four the next, and scarcely had any time to take my meals in the bargain. I have been almost suffocated with the dust flying down my throat after working so many hours upon such heavy work too, and sweating so much. It makes a man drink where he would not."

This system of over-work exists in the "slop" part of almost every business—indeed, it is the principal means by which the cheap trade is maintained. Let me cite from my letters in the *Chronicle* some more of my experience on this subject. As regards the London mantua-makers, I said:—"The workwomen for good shops that give fair, or tolerably fair wages, and expect good work, can make six average-sized mantles in a week, *working from ten to twelve hours a day;* but the slop-workers, by toiling from thirteen to sixteen hours a day, will make *nine* such sized mantles in a week. In a season of twelve weeks 1000 workers for the slop-houses and warehouses would at this rate make 108,000 mantles, or 36,000 more than workers for the fair trade. Or, to put it in another light, these slop-women, by being compelled, in order to live, to work such over-hours as inflict lasting injury on the health, supplant, by their over-work and over-hours, the labour of 500 hands, working the regular hours."

The following are the words of a chamber-master, working for the cheap shoe trade:—

"From people being obliged to work twice the hours they once *did* work, or that in reason they *ought* to work, a glut of hands is the consequence, and the masters are led to make reductions in the wages. They take advantage of our poverty and lower the wages, so as to undersell each other, and command business. My daughters have to work fifteen hours a day that we may make a bare living. They seem to have no spirit and no animation in them; in fact, such very hard work takes the youth out of them. They have no time to enjoy their youth, and, with all their work, they can't present the respectable appearance they ought." "I" (interposed my informant's wife) "often feel a faintness and oppression from my hard work, as if my blood did not circulate."

The better class of artizans denounce the system of Sunday working as the most iniquitous of all the impositions. They object to it, not only on moral and religious grounds, but economically also. "Every 600 men employed on the Sabbath," say they, "deprive 100 individuals of a week's work. Every six men who labour seven days in the week must necessarily throw one other man out of employ for a whole week. The seventh man is thus deprived of his fair share of work by the overtoiling of the other six." This Sunday working is a necessary consequence of the cheap slop-trade. The workmen cannot keep their families by their six days' labour, and therefore they not only, under that system, get less wages and do more work, but by their extra labour throw so many more hands out of employment.

Here then, in the over-work of many of the trade, we find a vast cause of surplus hands, and, consequently, of casual labour; and that the work in these trades has not proportionately increased is proven by the fact of the existence of a superfluity of workmen.

Let us now turn our attention to the second of the causes above cited, viz., *the causing of men to*

work quicker, and so to accomplish more in the same time. There are several means of attaining this end; it may be brought about either (*a*) by making the workman's gains depend directly on the quantity of work executed by him, as by the substitution of piece-work for day-work; (*b*) by the omission of certain details or parts necessary for the perfection of the work; (*c*) by decreasing the workman's pay, and so increasing the necessity for him to execute a greater quantity of work in order to obtain the same income; (*d*) increasing the supervision, and encouraging a spirit of emulation among the workpeople; (*e*) by dividing the labour into a number of simple and minute processes, and so increasing the expertness of the labourers; (*f*) by the invention of some new tool or machine for expediting the operations of the workman.

I shall give a brief illustration of each of these causes *seriatim*, showing how they tend to produce a surplusage of hands in the trades to which they are severally applied. And first, as to *making the workman's gains depend directly on the quantity of work executed by him.*

Of course there are but two direct modes of paying for labour—either by the day or by the piece. Over-work by day-work is effected by means of what is called the "strapping system" (as described in the *Morning Chronicle* in my letter upon the carpenters and joiners), where a whole shop are set to race over their work in silence one with another, each striving to outdo the rest, from the knowledge that anything short of extraordinary exertion will be sure to be punished with dismissal. Over-work by piece-work, on the other hand, is almost a necessary consequence of that mode of payment—for where men are paid by the quantity they do, of course it becomes the interest of a workman to do more than he otherwise would.

"Almost all who work by the day, or for a fixed salary, that is to say, those who labour for the gain of others, not for their own, have," it has been well remarked, "no interest in doing more than the smallest quantity of work that will pass as a fulfilment of the mere terms of their engagement. Owing to the insufficient interest which day labourers have in the result of their labour, there is a natural tendency in such labour to be extremely inefficient—a tendency only to be overcome by vigilant superintendence on the part of the persons who *are* interested in the result. The 'master's eye' is notoriously the only security to be relied on. But superintend them as you will, day labourers are so much inferior to those who work by the piece, that, as was before said, the latter system is practised in all industrial occupations where the work admits of being put out in definite portions, without involving the necessity of too troublesome a surveillance to guard against inferiority (or scamping) in the execution." But if the labourer at piece-work is made to produce a greater quantity than at day-work, and this solely by connecting his own interest with that of his employer, how much more largely must the productiveness of workmen be increased when labouring wholly on their own account! Accordingly it has been invariably found that whenever the operative unites in himself the double function of capitalist and labourer, as the "garret-master" in the cabinet trade, and the "chamber-master" in the shoe trade, making up his own materials or working on his own property, his productiveness, single-handed, is considerably greater than can be attained even under the large system of production, where all the arts and appliances of which extensive capital can avail itself are brought into operation.

As regards the increased production by *omitting certain details necessary for the due perfection of the work*, it may be said that "scamping" adds at least 200 per cent. to the productions of the cabinet-maker's trade. I ascertained, in the course of my previous inquiries, several cases of this over-work from scamping, and adduce two. A very quick hand, a little master, working, as he called it, "at a slaughtering pace," for a warehouse, made 60 plain writing-desks in a week of 90 hours; while a first-rate workman, also a quick hand, made 18 in a week of 70 hours. The scamping hand said he must work at the rate he did to make 14*s.* a week from a slaughter-house; and so used to such style of work had he become, that, though a few years back he did West-end work in the best style, he could not now make eighteen desks in a week, if compelled to finish them in the style of excellence displayed in the work of the journeyman employed for the honourable trade. Perhaps, he added, he couldn't make them in that style at all. The frequent use of rosewood veneers in the fancy cabinet, and their occasional use in the general cabinet trade gives, I was told, great facilities for scamping. If in his haste the scamping hand injure the veneer, or if it have been originally faulty, he takes a mixture of gum shellac and "colour" (colour being a composition of Venetian red and lamp black), which he has ready by him, rubs it over the damaged part, smooths it with a slightly-heated iron, and so blends it with the colour of the rosewood that the warehouseman does not detect the flaw. In the general, as contradistinguished from the fancy, cabinet trade I found the same ratio of "scamping." A good workman in the better-paid trade made a four-foot mahogany chest of drawers in five days, working the regular hours, and receiving, at piece-work price, 35*s.* A scamping hand made five of the same size in a week, and had time to carry them for sale to the warehouses, wait for their purchase or refusal, and buy material. But for the necessity of doing this the scamping hand could have made seven in the 91 hours of his week, though of course in a very inferior manner. "They would hold together for a time," I was assured, "and that was all; but the slaughterer cared only to have them viewly and cheap." These two cases exceed the average, and I have cited them to show what *can* be done under the scamping system.

We now come to the *increased rate of working induced by a reduction of the ordinary rate of remuneration of the workman.* Not only is it true that over-work makes under-pay, but the

Original from HARVARD UNIVERSITY

converse of the proposition is equally true, that under-pay makes over-work—that is to say, it is true of those trades where the system of piece-work or small mastership admits of the operative doing the utmost amount of work that he is able to accomplish; for the workman in such cases seldom or never thinks of reducing his expenditure to his income, but rather of increasing his labour, so as still to bring his income, by extra production, up to his expenditure. Hence we find that, as the wages of a trade descend, so do the labourers extend their hours of work to the utmost possible limits—they not only toil earlier and later than before, but the Sunday becomes a work-day like the rest (amongst the "sweaters" of the tailoring trade Sunday labour, as I have shown, is almost universal); and when the hours of work are carried to the extreme of human industry, then more is sought to be done in a given space of time, either by the employment of the members of their own family, or apprentices, upon the inferior portion of the work, or else by "scamping it." "My employer," I was told by a journeyman tailor working for the Messrs. Nicoll, "reduces my wages one-third, and the consequence is, I put in two stitches where I used to give three." "I must work from six to eight, and later," said a pembroke-table-maker to me, "to get 18*s*. now for my labour, where I used to get 54*s*. a week—that's just a third. I could in the old times give my children good schooling and good meals. Now children have to be put to work very young. I have four sons working for me at present. Not only, therefore, does any stimulus to extra production make over-work, and over-work make under-pay; but under-pay, by becoming an additional provocative to increased industry, again gives rise in its turn to over-work. Hence we arrive at a plain unerring law—*over-work makes under-pay and under-pay makes over-work.*

But the above means of increasing the rate of working refer solely to those cases where the extra labour is induced by making it the *interest* of the workman so to do. The other means of extra production is *by stricter supervision of journeymen, or those paid by the day.* The shops where this system is enforced are termed "strapping-shops," as indicative of establishments where an undue quantity of work is expected from a journeyman in the course of the day. Such shops, though not directly making use of cheap labour (for the wages paid in them are generally of the higher rate), still, by exacting more work, may of course be said, in strictness, to encourage the system now becoming general, of less pay and inferior skill. These strapping establishments sometimes go by the name of "scamping shops," on account of the time allowed for the manufacture of the different articles not being sufficient to admit of good workmanship.

Concerning this "*strapping*" system I received the following extraordinary account from a man after his heavy day's labour. Never in all my experience had I seen so sad an instance of over-work. The poor fellow was so fatigued that he could hardly rest in his seat. As he spoke he sighed deeply and heavily, and appeared almost spirit-broken with excessive labour:—

"I work at what is called a strapping shop," he said, "and have worked at nothing else for these many years past in London. I call 'strapping' doing as much work as a human being or a horse possibly can in a day, and that without any hanging upon the collar, but with the foreman's eyes constantly fixed upon you, from six o'clock in the morning to six o'clock at night. The shop in which I work is for all the world like a prison; the silent system is as strictly carried out there as in a model gaol. If a man was to ask any common question of his neighbour, except it was connected with his trade, he would be discharged there and then. If a journeyman makes the least mistake, he is packed off just the same. A man working at such places is almost always in fear; for the most trifling things he's thrown out of work in an instant. And then the quantity of work that one is forced to get through is positively awful; if he can't do a plenty of it, he don't stop long where I am. No one would think it was possible to get so much out of blood and bones. No slaves work like we do. At some of the strapping shops the foreman keeps continually walking about with his eyes on all the men at once. At others the foreman is perched high up, so that he can have the whole of the men under his eye together. I suppose since I knew the trade that a *man does four times the work that he did formerly.* I know a man that's done four pairs of sashes in a day, and one is considered to be a good day's labour. What's worse than all, the men are every one striving one against the other. Each is trying to get through the work quicker than his neighbours. Four or five men are set the same job, so that they may be all pitted against one another, and then away they go every one striving his hardest for fear that the others should get finished first. They are all tearing along from the first thing in the morning to the last at night, as hard as they can go, and when the time comes to knock off they are ready to drop. I was hours after I got home last night before I could get a wink of sleep; the soles of my feet were on fire, and my arms ached to that degree that I could hardly lift my hand to my head. Often, too, when we get up of a morning, we are more tired than when we went to bed, for we can't sleep many a night; but we mustn't let our employers know it, or else they'd be certain we couldn't do enough for them, and we'd get the sack. So, tired as we may be, we are obliged to look lively, somehow or other, at the shop of a morning. If we're not beside our bench the very moment the bell's done ringing, our time's docked—they wont give us a single minute out of the hour. If I was working for a fair master, I should do nearly one-third, and sometimes a half, less work than I am now forced to get through, and, even to manage that much, I shouldn't be idle a second of my time. It's quite a mystery to me how they *do* contrive to get so much work

Original from HARVARD UNIVERSITY

out of the men. But they are very clever people. They know how to have the most out of a man, better than any one in the world. They are all picked men in the shop—regular 'strappers,' and no mistake. The most of them are five foot ten, and fine broad-shouldered, strong-backed fellows too—if they weren't they wouldn't have them. Bless you, they make no words with the men, they sack them if they 're not strong enough to do all they want; and they can pretty soon tell, the very first shaving a man strikes in the shop, what a chap is made of. Some men are done up at such work—quite old men and gray with spectacles on, by the time they are forty. I have seen fine strong men, of 36, come in there and be bent double in two or three years. They are most all countrymen at the strapping shops. If they see a great strapping fellow, who they think has got some stuff about him that will come out, they will give him a job directly. We are used for all the world like cab or omnibus horses. Directly they've had all the work out of us, we are turned off, and I am sure, after my day's work is over, my feelings must be very much the same as one of the London cab horses. As for Sunday, it is *literally* a day of rest with us, for the greater part of us lay a-bed all day, and even that will hardly take the aches and pains out of our bones and muscles. When I 'm done and flung by, of course I must starve."

The next means of inducing a quicker rate of working, and so economizing the number of labourers, is by the *division* and *subdivision of labour*. In perhaps all the skilled work of London, of the better sort, this is more or less the case; it is the case in a much smaller degree in the country.

The nice subdivision makes the operatives perfect adepts in their respective branches, working at them with a greater and a more assured facility than if their care had to be given to the whole work, and in this manner the work is completed in less time, and consequently by fewer hands.

In illustration of the extraordinary increased productiveness induced by the division of labour, I need only cite the well-known cases:—

"It is found," says Mr. Mill, "that the productive power of labour is increased by carrying the separation further and further; by breaking down more and more every process of industry into parts, so that each labourer shall confine himself to an even smaller number of simple operations. And thus, in time, arise those remarkable cases of what is called the division of labour, with which all readers on subjects of this nature are familiar. Adam Smith's illustration from pin-making, though so well-known, is so much to the point, that I will venture once more to transcribe it. 'The business of making a pin is divided into eighteen distinct operations. One man draws out the wire, another straightens it, a third cuts it, a fourth points it, and a fifth grinds it at the top for receiving the head; to make the head requires two or three distinct operations; to put it on, is a peculiar business; to whiten the pins is another; it is even a trade by itself to put them into the paper. I have seen a small manufactory where ten men only were employed, and were some of them, consequently, performed two or three distinct operations. But though they were very poor, and therefore but indifferently accommodated with the necessary machinery, they could, when they exerted themselves, make among them about twelve pounds of pins in a day. There are in a pound upwards of 4000 pins of a middling size.

"'Those ten persons, therefore, could make among them upwards of 48,000 pins in a day. Each person, therefore, making a tenth part of 48,000 pins, might be considered as making 4800 pins in a day. But if they had all wrought separately and independently, and without any of them having been educated to this peculiar business, they certainly could not each of them have made 20, perhaps not one pin in a day.'"

M. Say furnishes a still stronger example of the effects of division of labour, from a not very important branch of industry certainly, the manufacture of playing cards. "It is said by those engaged in the business, that each card, that is, a piece of pasteboard of the size of the hand, before being ready for sale, does not undergo fewer than 70 operations, every one of which might be the occupation of a distinct class of workmen. And if there are not 70 classes of work-people in each card manufactory, it is because the division of labour is not carried so far as it might be; because the same workman is charged with two, three, or four distinct operations. The influence of this distribution of employment is immense. I have seen a card manufactory where thirty workmen produced daily 15,500 cards, being above 500 cards for each labourer; and it may be presumed that if each of these workmen were obliged to perform all the operations himself, even supposing him a practised hand, he would not, perhaps, complete two cards in a day; and the 30 workmen, instead of 15,500 cards, would make only 60."

One great promoter of the decrease of manual labour is to be found in the economy of labour from a very different cause to any I have pointed out as tending to the increase of surplus hands and casual labour, viz., to *the use of machinery*.

In this country the use of machinery has economised the labour both of man and horse to a greater extent than is known in any other land, and that in nearly all departments of commerce or traffic. The total estimated machine power in the kingdom is 600,000,000 of human beings, and this has been all produced within the last century. In agriculture, for example, the threshing of the corn was the peasant's work of the later autumn and of a great part of the winter, until towards the latter part of the last century. The harvest was hardly considered complete until the corn was threshed by the peasants. On the first introduction of the threshing machines, they were demolished in many places by the country labourers, whose rage was excited to find that their winter's work, instead of being regular, had become *casual*.

But the use of these machines is now almost

universal. It would, of course, be the height of absurdity to say that threshing machines could possibly increase the number of threshers, even as the reaping machines cannot possibly increase the number of reapers; their effect is rather to displace the greater number of labourers so engaged, and hence indeed the "economy" of them. It is not known what number of men were, at any time, employed in threshing corn. Their displacement was gradual, and in some of the more remote parts of the provinces, the flails of the threshers may be heard still, but if a threshing machine—for they are of different power—do the work, as has been stated, of six labourers, the economization or displacement of manual labour is at once shown to be the economization and displacement of the whole labour (for a season) of a country side; thus increasing surplus hands.

In other matters—in the unloading vessels by cranes, in *all* branches of manufactures, and even in such minor matters as the grinding of coffee berries, and the cutting and splitting of wood for lucifer matches, an immense amount of manual labour has been minimized, economized, or displaced by steam machinery. On my inquiry into the condition of the London sawyers, I found that the labour of 2000 men had been displaced by the steam saw-mills of the metropolis alone. At one of the largest builder's I saw machines for making mortises and tenons, for sticking mouldings, and, indeed, performing all the operations of the carpenter—one such machine doing the work, perhaps, of a hundred men. I asked the probable influence that such an instrument was likely to have on the men? "Ruin them all," was the laconic reply of the superintendent of the business! Within the last year casks have been made by machinery—a feat that the coopers declared impossible. Wheels, also, have been lately produced by steam. I need, however, as I have so recently touched upon the subject, do no more than call attention to the information I have given (p. 240, vol. ii.) concerning the use of machinery in lieu of human labour. It is there shown that if the public street-sweeping were effected, throughout the metropolis, by the machines, nearly 196 of the 275 manual labourers, now scavaging for the parish contractors, would be thrown out of work, and deprived of 7438*l*., out of their joint earnings, in the year.

It is the fashion of political economists to insist on the general proposition that machinery increases the demand for labour, rather than decreases it; when they write unguardedly, however, they invariably betray a consciousness that the benefits of machinery to manual labourers are not quite so invariable as they would otherwise make out. Here, for instance, is a confession from the pamphlet on "the Employer and Employed," published by the Messrs. Chambers, gentlemen who surely cannot be accused of being averse to economical doctrines. It is true the pamphlet is intended to show the evils of strikes to working men, but it likewise points out the evils of mechanical power to the same class when applied to certain operations.

"Strikes also lead to *the superseding of hand labour by machines*," says this little work. "In 1831, on the occasion of a strike at Manchester, several of the capitalists, afraid of their business being driven to other countries, had recourse to the celebrated machinists, Messrs. Sharp and Co. of Manchester, requesting them to direct the inventive talents of their partner, Mr. Roberts, to the construction of a self-acting mule, in order to emancipate the trade from galling slavery and impending ruin. Under assurances of the most liberal encouragement in the adoption of his invention, Mr. Roberts suspended his professional pursuits as an engineer, and set his fertile genius to construct a spinning automaton. In the course of a few months he produced a machine, called the 'Self-acting Mule,' which, in 1834, was in operation in upwards of 60 factories; *doing the work of the head spinners so much better than they could do it themselves, as to leave them no chance against it.*

"In his work on the 'Philosophy of Manufactures,' Dr. Ure observes on the same subject—'The elegant art of calico-printing, which embodies in its operations the most elegant problems of chemistry, as well as mechanics, had been for a long period the sport of foolish journeymen, who turned the liberal means of comfort it furnished them into weapons of warfare against their employers and the trade itself. They were, in fact, by their delirious combinations, plotting to kill the goose which laid the golden eggs of their industry, or to force it to fly off to a foreign land, where it might live without molestation. In the spirit of Egyptian task-masters, the operative printers dictated to the manufacturers the number and quality of the apprentices to be admitted into the trade, the hours of their own labour, and the wages to be paid them. At length capitalists sought deliverance from this intolerable bondage in the resources of science, and were speedily reinstated in their legitimate dominion of the head over the inferior members. The four-colour and five-colour machines, which now render calico-printing an unerring and expeditious process, are mounted in all great establishments. It was under the high-pressure of the same despotic confederacies, that self-acting apparatus for executing the dyeing and rinsing operations has been devised.'

"The croppers of the West Riding of Yorkshire, and the hecklers or flax-dressers, can unfold 'a tale of wo' on this subject. Their earnings exceeded those of most mechanics; but the frequency of strikes among them, and the irregularities in their hours and times of working, compelled masters to substitute machinery for their manual labour. *Their trades, in consequence, have been in a great measure superseded.*"

It must, then, be admitted that machinery, *in some cases at least*, does displace manual labour, and so tend to produce a surplusage of labourers, even as over-work, Sunday-work, scamping-work, strapping-work, piece-work, minutely-divided work, &c., have the same effect so long as the quantity of work to be done remains unaltered. *The extensibility of the market* is the one circumstance

Original from HARVARD UNIVERSITY

which determines whether the economy of labour produced by these means is a blessing or a curse to the nation. To apply mechanical power, the division of labour, the large system of production, or indeed any other means of enabling a less number of labourers to do the same amount of work *when the quantity of work to be done is limited in its nature*, as, for instance, the threshing of corn, the sawing of wood, &c., is necessarily to make either paupers or criminals of those who were previously honest independent men, living by the exercise of their industry in that particular direction. Economize your labour one-half, in connection with a particular article, and you must sell twice the quantity of that article or displace a certain number of the labourers; that is to say, suppose it requires 400 men to produce 4000 commodities in a given time, then, if you enable 200 men to produce the same quantity in the same time, you must get rid of 8000 commodities, or deprive a certain number of labourers of their ordinary means of living. Indeed, the proposition is almost self-evident, though generally ignored by social philosophers: economize your labour at a greater rate than you expand your markets, and you must necessarily increase your paupers and criminals in precisely the same ratio. "The division of labour," says Mr. Mill, following Adam Smith, "is limited by the extent of the market. If by the separation of pin-making into ten distinct employments 48,000 pins can be made in a day, this separation will only be advisable if the number of accessible consumers is such as to require every day something like 48,000 pins. If there is a demand for only 25,000, the division of labour can be advantageously carried but to the extent which will every day produce that smaller number." Again, as regards the large system of production, the same authority says, "the possibility of substituting the large system of production for the small depends, of course, on the extent of the market. The large system can only be advantageous when a large amount of business is to be done; it implies, therefore, either a populous and flourishing community, or a great opening for exportation." But these are mere glimmerings of the broad incontrovertible principle, that *the economization of labour at a greater rate than the expansion of the markets, is necessarily the cause of surplus labour in a community.*

The effect of machinery in depriving the families of agricultural labourers of their ordinary sources of income is well established. "Those countries," writes Mr. Thornton, "in which the class of agricultural labourers is most depressed, have all one thing in common. Each of them was formerly the seat of a flourishing manufacture carried on by the cottagers at their own homes, which has now decayed or been withdrawn to other situations. Thus, in Buckinghamshire and Bedfordshire, the wives and children of labouring men had formerly very profitable occupation in making lace; during the last war a tolerable lace-maker, working eight hours a day, could easily earn 10*s*. or 12*s*. a week; the profits of this employment have been since so much reduced by the use of machinery, that a pillow lacemaker must now work twelve hours daily to earn 2*s*. 6*d*. a week."

The last of the conditions above cited, as causing the same or a greater amount of work to be executed with a less quantity of labour, is *the large system of production*. Mr. Babbage and Mr. Mill have so well and fully pointed out "the economy of labour" effected in this manner, that I cannot do better than quote from them upon this subject:—

"Even when no additional subdivision of the work," says Mr. Mill, "would follow an enlargement of the operations, there will be good economy in enlarging them to the point at which every person to whom it is convenient to assign a special occupation will have full employment in that occupation." This point is well illustrated by Mr. Babbage:—"If machines be kept working through the 24 hours" [which is evidently the only economical mode of employing them], "it is necessary that some person shall attend to admit the workmen at the time they relieve each other; and whether the porter or other servant so employed admit one person or twenty, his rest will be equally disturbed. It will also be necessary occasionally to adjust or repair the machine; and this can be done much better by a workman accustomed to machine-making than by the person who uses it. Now, since the good performance and the duration of machines depend, to a very great extent, upon correcting every shake or imperfection in their parts as soon as they appear, the prompt attention of a workman resident on the spot will considerably reduce the expenditure arising from the wear and tear of the machinery. But in the case of a single lace-frame, or a single loom, this would be too expensive a plan. Here, then, arises another circumstance, which tends to enlarge the extent of the factory. It ought to consist of such a number of machines as shall occupy the whole time of one workman in keeping them in order. If extended beyond that number the same principle of economy would point out the necessity of doubling or tripling the number of machines, in order to employ the whole time of two or three skilful workmen. Where one portion of the workman's labour consists in the exertion of mere physical force, as in weaving, and in many similar arts, it will soon occur to the manufacturer that, if that part were executed by a steam-engine, the same man might, in the case of weaving, attend to two or more looms at once; and, since we already suppose that one or more operative engineers have been employed, the number of looms may be so arranged that their time shall be fully occupied in keeping the steam-engine and the looms in order.

"Pursuing the same principles, the manufactory becomes gradually so enlarged that the expense of lighting during the night amounts to a considerable sum; and as there are already attached to the establishment persons who are up all night, and can therefore constantly attend to it, and also engineers to make and keep in repair any

Original from HARVARD UNIVERSITY

machinery, the addition of an apparatus for making gas to light the factory leads to a new extension, at the same time that it contributes, by diminishing the expense of lighting and the risk of accidents from fire, to reduce the cost of manufacturing.

"Long before a factory has reached this extent it will have been found necessary to establish an accountant's department, with clerks to pay the workmen, and to see that they arrive at their stated times; and this department must be in communication with the agents who purchase the raw produce, and with those who sell the manufactured article. It will cost these clerks and accountants little more time and trouble to pay a large number of workmen than a small number, to check the accounts of large transactions than of small. If the business doubled itself it would probably be necessary to increase, but certainly not to double, the number either of accountants or of buying and selling agents. *Every increase of business would enable the whole to be carried on with a proportionally smaller amount of labour.* As a general rule, the expenses of a business do not increase by any means proportionally to the quantity of business. Let us take as an example a set of operations which we are accustomed to see carried on by one great establishment—that of the Post Office.

"Suppose that the business, let us say only of the London letter-post, instead of being centralised in a single concern, were divided among five or six competing companies. Each of these would be obliged to maintain almost as large an establishment as is now sufficient for the whole. Since each must arrange for receiving and delivering letters in all parts of the town, each must send letter-carriers into every street, and almost every alley, and this, too, as many times in the day as is now done by the Post Office, if the service is to be as well performed. Each must have an office for receiving letters in every neighbourhood, with all subsidiary arrangements for collecting the letters from the different offices and re-distributing them. I say nothing of the much greater number of superior officers who would be required to check and control the subordinates, implying not only a greater cost in salaries for such responsible officers, but the necessity, perhaps, of being satisfied in many instances with an inferior standard of qualification, and so failing in the object."

But this refers solely to the "large system of business" as applied to purposes of manufacture and distribution. In connection with agriculture there is the same saving of labour effected. "The large farmer," says Mr. Mill, "has some advantage in the article of buildings. It does not cost so much to house a great number of cattle in one building, as to lodge them equally well in several buildings. There is also some advantage in implements. A small farmer is not so likely to possess expensive instruments. But the principal agricultural implements, even when of the best construction, are not expensive. It may not answer to a small farmer to own a threshing machine for the small quantity of corn he has to thresh; but there is no reason why such a machine should not in every neighbourhood be owned in common, or provided by some person to whom the others pay a consideration for its use. The large farmer can make some saving in cost of carriage. There is nearly as much trouble in carrying a small portion of produce to market, as a much greater produce; in bringing home a small, as a much larger quantity of manure, and articles of daily consumption. There is also the greater cheapness of buying things in large quantities."

A short time ago I went into Buckinghamshire to look into the allotment system. And, in one parish of 1800 acres, I found that some years ago there were seventeen farmers who occupied, upon the average, 100 acres each, and who, previous to the immigration of the Irish harvest-men, *constantly* employed six men a-piece, or, in the aggregate, upwards of 100 hands. Now, however, the farmers in the same parish occupy to the extent of 300 acres each, and respectively employ only six men *and a few extra hands at harvest time.* Thus the number of hands employed by this system has been decreased one-half. I learned, moreover, from a clergyman there, who had resided in Wiltshire, that the same thing was going on in that county also; that small farms were giving way to large farms, and that at least half the labourers had been displaced. The agricultural labourers, at the time of taking the last census, were 1,500,000 in number; so that, if this system be generally carried out, there must be 750,000 labourers and their families, or 3,000,000 people, deprived of their living by it.

Sir James Graham, in his evidence before the Committee on Criminal Commitments, has given us some curious particulars as to the decrease of the number of hands required for agricultural purposes, where the large system of production is pursued in place of the small: he has told us how many hands he was enabled to get rid of by these means, the proportion of labour displaced, it will be seen, amounted to about 10 per cent. of the labouring population. In answer to a question relative to the increase of population in his district, he replied:—

"I have myself taken *very strong means to prevent it*, for it so happens that my whole estate came out of lease in the year 1822, after the currency of a lease of fourteen years; and by *consolidation of farms, and the destruction of cottages, I have diminished, upon my own property, the population to the extent of from 300 to 400 souls.*"

"On how many acres?—On about 30,000 acres." [This is at the rate of one in every 100 acres].

"What was the whole extent of population?—It was under 4000 before I reduced it.

"What became of those 300 or 400?—The greater part of them, being small tenants were, enabled to find farms on the estates of other proprietors, who pursued the opposite course of subdividing their estates for the purpose of obtaining

higher nominal rents; *others have become day labourers*, and as day labourers, I have reason to know, they are more thriving than they were on my estate as small farmers, subject to a high rent, which their want of capital seldom enabled them to pay; two or three of these families went to America.

"Have you any out of work?—None entirely out of work, some only partially employed; but since the *dispersion of this large mass of population*, the supply of labour has not much exceeded the demand, for *whenever I removed a family, I pulled down the house*, and the parochial jealousy respecting settlements is an ample check on the influx of strangers."

Similar to the influence of the large system of production in its displacement of labourers, as enabling a larger quantity of work to be executed by one establishment with a smaller number of hands than would be required were the amount of work to be divided into a number of smaller establishments,—similar to this mode of economizing labour, is that mode of work which, by altering the produce rather than the mode of production, and by substituting an article that requires less labour for one that required more, gets rid of a large quantity of labour, and, consequently, adds to the surplusage of labourers. An instance of this is in the substitution of pasturage for tillage. "*Plough less and graze more*," says Sir J. Graham, the great economist of labour, simply because fewer people will be required to attend to the land. But this plan of grazing instead of ploughing was adopted in this country some centuries back, and with what effect to the labourers and the people at large, the following extract from the work of Mr. Thornton, on over-population, will show:—

"The extension of the woollen manufacture was raising the price of wool; and the little attendance which sheep require was an additional motive for causing sheep farming to be preferred to tillage. Arable land, therefore, began to be converted into pasture; and the seemingly-interminable corn fields, which, like those of Germany at this day, probably extended for miles without having their even surface broken by fences or any other visible boundaries, disappeared. After being sown with grass they were surrounded and divided by inclosures, to prevent the sheep from straying, and to do away with the necessity of having shepherds always on the watch. By these changes the quantity of work to be done upon a farm was exceedingly diminished, and most of the servants, whom it had been usual to board and lodge in the manor and farm-houses, were dismissed. This was not all. The married farm-servants were ousted from their cottages, which were pulled down, and their gardens and fields were annexed to the adjoining meadows. The small farmers were treated in the same way, as their leases fell in, *and were sent to join the daily increasing crowd of competitors for work that was daily increasing in quantity*.

"Even freeholders were in some instances ejected from their lands. This social revolution had probably commenced even before the prosperity of the peasantry had reached its climax; but in 1487 it attracted the notice of Parliament, and an Act was passed to restrain its progress; for already it was observed that inclosures were becoming 'more frequent, whereby arable land, *which could not be manured without people and families, was turned into pasture, which was easily rid by a few herdsmen*;' and that 'tenancies for years, lives, and at will, whereupon most of the yeomanry lived, were turned into demesnes' *. In 1533 †, An act was passed strongly condemning the practice of 'accumulating' farms, which it was declared had reduced 'a marvellous multitude' of the people to poverty and misery, and left them no alternative but to steal, or to die 'pitifully' of cold and hunger. In this Act it was stated that single farms might be found with flocks of from 10,000 to 20,000 sheep upon them; and it was ordained that no man should keep more than 2000 sheep, except upon his own land, or rent more than two farms.

"Two years later it was enacted that the king should have a moiety of the profits of land converted (subsequently to a date specified) from tillage to pastures, until a suitable house was erected, and the land was restored to tillage. In 1552, a law ‡ was made which required that on all estates as large a quantity of land as had been kept in tillage for four years together at any time since the accession of Henry VIII., should be so continued in tillage. But these, and many subsequent enactments of the same kind, had not the smallest effect in checking the consolidation of farms. We find Roger Ascham, in Queen Elizabeth's reign, lamenting the dispersion of families, the ruin of houses, the breaking up and destruction of 'the noble yeomanry, the honour and strength of England.' Harrison also speaks of towns pulled down for sheep-walks; 'and of the tenements that had fallen either down or into the lord's hands;' or had been 'brought and united together by other men, so that in some one manor, seventeen, eighteen, or twenty houses were shrunk.' §

"'Where have been a great many householders and inhabitants,' says Bishop Latimer, 'there is now but a shepherd and his dog.' ‖ And in a curious tract, published in 1581, by one William Stafford, a husbandman is made to exclaim, 'Marry, these inclosures do and undo us all, for they make us pay dearer for our land that we occupy, and causeth that we can have no land to put to tillage; all is taken up for pasture, either for sheep or for grazing of cattle, insomuch that I have known of late a dozen ploughs, within less compass than six miles about me, laid down within this seven years; and where threescore persons or upwards had their livings, now one man, with his cattle, hath all. Those sheep is

the cause of all our mischief, for they have driven husbandry out of the country, by which was increased before all kinds of victuals, and now altogether sheep, sheep, sheep.'* While numbers of persons were thus continually driven from their homes, and deprived of their means of livelihood, we need not be at a loss to account for the increase of vagrancy, without ascribing it to the increase of population."

As an instance, within our time, of the same mode of causing a surplusage of labourers, and so adding to the quantity of casual labour in the kingdom, viz., by the extension of pasturage and consequent diminution of tillage, we may cite the "clearances," as they were called, which took place, some few years back, in the Highlands of Scotland. "It is only within the last few years," says the author above quoted, "that the strathes and glens of Sutherland have been *cleared of their inhabitants, and that the whole country has been converted into one immense sheepwalk*, over which the traveller may proceed for 40 miles together without seeing a tree or a stone wall, or anything, but a heath dotted with sheep and lambs† . . . . . . The example of Sutherland is imitated in the neighbouring counties. During the last four years *some hundreds of families* have been 'weeded' out of Ross-shire, and nearly 400 more have received notice to quit next year. Similar notice has been given to 34 families in Cromarty, and only the other day eighteen families, who were living in peace and comfort, in Glencalvie, in Ross-shire, were expelled from the farms occupied for ages by themselves and their forefathers, to make room for sheep." And still we are told to "*plough less and graze more!*"

We now come to the last-mentioned of the circumstances inducing a surplusage of labourers, and, consequently, augmenting the amount of casual labour throughout the kingdom, viz., by *altering the mode of hiring the labourers.* At page 236 of the present volume, I have said, in connection with this part of the subject,—

"Formerly the mode of hiring farm-labourers was by the year, so that the employer was bound to maintain the men when unemployed. But now weekly hirelings and even journey-work, or hiring by the day, prevail, and the labourers being paid mere subsistence-money only when wanted are necessitated to become either paupers or thieves when their services are no longer required. It is, moreover, this change from yearly to weekly and daily hirings, and the consequent discarding of men when no longer wanted, that has partly caused the immense mass of surplus labourers, who are continually vagabondizing through the country, begging or stealing as they go—men for whom there is but some two or three weeks' work (harvesting, hop-picking, and the like) throughout the year."

Blackstone, in treating of the laws relating to master and servant (the greater part of the farm labourers or farm servants, as they were then called, being included under the latter head), tells us at page 425 of his first volume—

"The first sort of servants, acknowledged by the laws of England, are MENIAL SERVANTS; so called from being *intra mœnia*, or domestic. The contract between them and their masters arises upon the hiring. If the hiring be generally, without any particular *time limited*, the law construes it to be a *hiring for a year* (Co. Lit. 42); upon a principle of natural equity, that the servant shall serve, and the master maintain him, throughout all the revolutions of the respective seasons, as well when *there is work to be* done, *as when there is not.*"

Mr. Thornton says, "until recently it had been common for farm servants, even when married and living in their own cottages, to take their meals with their master; and, what was of more consequence, in every farm-house, many unmarried servants, of both sexes, were lodged, as well as boarded. The latter, therefore, even if ill paid, might be tolerably housed and fed, and many of them fared, no doubt, much better than they could have done if they had been left to provide for themselves, with treble their actual wages."

Formerly throughout the kingdom—and it is a custom *still* prevalent in some parts, more especially in the north—single men and women seeking engagements as farm-servants, congregated at what were called the "Hirings," held usually on the three successive market days, which were nearest to May-day and Martinmas-day. The hiring was thus at two periods of the year, but the engagement was usually for the twelvemonth. By the concurrent consent, however, of master and servant, when the hiring took place, either side might terminate it at the expiration of the six months, by giving due notice; or a further hiring for a second twelvemonth could be legally effected without the necessity of again going to the hirings. The servants, even before their term of service had expired, could attend a hiring (generally held under the authority of the town's charter) as a matter of right; the master and mistress having no authority to prevent them. The Market Cross was the central point for the holding of the hirings, and the men and women, the latter usually the most numerous, stood in rows around the cross. The terms being settled, the master or mistress gave the servant "a piece of money," known as a "god's penny" (the "handsel penny"), the offer and acceptance of this god's penny being a legal ratification of the agreement, without any other step. In the old times such engagements had almost always (as shown in the term "God's penny") a character of religious obligation. At the earliest period, the hirings were held in the church-yards; afterwards by the Market Cross.

I have spoken of this matter more in the past than the present tense, for the system is greatly changed as regards the male farm-servant, though little as regards the female. Now the male farm-labourers, instead of being hired for a specific term, are more generally hired by week, by job, or by day; indeed, even "half-a-day's" work is known. At one period it was merely the

married country labourers, residing in their own cottages, who were temporarily engaged, but it is now the general body, married and unmarried, old and young, with a few exceptions. Formerly the farmer was bound to find work for six or twelve months (for both terms existed) for his hired labourers. If the land did not supply it, still the man must be maintained, and be paid his full wages when due. By such a provision, the labour and wage of the hired husbandman were regular and rarely *casual;* but this arrangement is now seldom entered into, and the hired husbandman's labour is consequently generally casual and rarely regular. This principle of hiring labourers only for so long as they are wanted, as contradistinguished from the "*principle of natural equity,*" spoken of by Blackstone, which requires that "the servant shall serve and the master maintain him *throughout all the revolutions of the respective seasons, as well when there is work to be done as when there is not,*" has been the cause, perhaps, of more casual labour and more pauperism and crime, in this country, than, perhaps, any other of the antecedents before mentioned. The harvest is now collected solely by casual labourers, by a horde of squalid immigrants, or the tribe of natural and forced vagabonds who are continually begging or stealing their way throughout the country; our hops are picked, our fruit and vegetables gathered by the same precarious hands—wretches who, perhaps, obtain some three months' harvest labour in the course of the year. The ships at our several ports are discharged by the same "*casual hands,*" who may be seen at our docks scrambling like hounds for the occasional bit of bread that is vouchsafed to them; there numbers loiter throughout the day, even on the chance of *an hour's employment;* for the term of hiring has been cut down to the finest possible limits, so that the labourer may not be paid for even a second longer than he is wanted. And since he gets only bare subsistence money when employed, "What," we should ask ourselves, "*must* be his lot when unemployed?"

I now come to consider the circumstances causing an undue increase of the labourers in a country. Thus far we have proceeded on the assumption that both the quantity of work to be done and the number of hands to do it remained stationary, and we have seen that by the mere alteration of the time, rate, and mode of working, a vast amount of surplus, and, consequently, casual labour may be induced in a community. We have now to ascertain how, still assuming the quantity of work to remain unaltered, the same effect may be brought about by an undue *increase of the number of labourers.*

There are many means by which the number of labourers may be increased besides that of a positive increase of the people. These are—

1. By the undue increase of apprentices.
2. By drafting into the ranks of labour those who should be otherwise engaged, as women and children.
3. By the importation of labourers from abroad.
4. By the migration of country labourers to towns, and so overcrowding the market in the cities.
5. By the depression of other trades.
6. By the undue increase of the people themselves.

Each and every of the first-mentioned causes are as effective a circumstance for the promotion of surplus labour, as even the positive extension of the population of the country.

Let me begin with the undue increase of a trade by means of *apprentices.*

This is, perhaps, one of the chief aids to the cheap system. For it is principally by apprentice labour that the better masters, as well as workmen, are undersold, and the skilled labourer consequently depressed to the level of the unskilled. But the great evil is, that the cheapening of goods by this means causes an undue increase in the trade. The apprentices grow up and become labourers, and so the trade is glutted with workmen, and casual labour is the consequence.

This apprentice system is the great bane of the printer's trade. Country printers take an undue number of boys to help them cheap; these lads grow up, and then, finding wages in the provinces depressed through this system of apprentice labour, they flock to the towns, and so tend to glut the labour market, and consequently to increase the number of casual hands.

One cause of the increased surplus and casual labour in such trades as dressing-case, work-box, writing-desk-making and other things in the fancy cabinet trade (among the worst trades even in Spitalfields and Bethnal Green), shoemaking, and especially of women and children's shoes, is the taking of many apprentices by small masters (supplying the great warehouses). As journey-work is all but unknown in the slop fancy cabinet trade, an apprentice, when he has "served his time," must start on his own account in the same wretched way of business, or become a casual labourer in some unskilled avocation, and this is one way in which the hands surely, although gradually, increase beyond the demand. It is the same with the general slop cabinet-maker's trade in the same parts. The small masters supply the "slaughter-houses," the linen-drapers, &c., who sell cheap furniture; they work in the quickest and most scamping manner, and do more work (which is nearly all done on the chance of sale), as they must confine themselves to one branch. The slop chair-makers cannot make tables, nor the slop table-makers, chairs; nor the cheffonier and drawer-makers, bedsteads; for they have not been taught. Even if they knew the method, and *could* accomplish other work, the want of practice would compel them to do it slowly, and the slop mechanic can never afford to work slowly. Such classes of little masters, then, to meet the demand for low-priced furniture, rear their sons to the business, and frequently take apprentices, to whom they pay small amounts. The hands so trained (as in the former instances) are not skilled enough to work for the honourable trade, so that they can only adopt the course pursued by their parents, or masters, before them. Hence a rapid, although again gradual,

increase of surplus hands; or hence a resort to some unskilled labour, to be wrought casually. This happens too, but in a smaller degree, in trades which are not slop, from the same cause. Concerning the *apprentice system* in the boot and shoe trade, when making my inquiries into the condition of the London workmen, I received the following statements:—

"My employer had seven apprentices when I was with him; of these, two were parish apprentices (I was one), and the other five from the Refuge for the Destitute, at Hoxton. With each Refuge boy he got 5*l.* and three suits of clothes, and a kit (tools). With the parish boys of Covent-garden and St. Andrew's, Holborn, he got 5*l.* and two suits of clothes, reckoning what the boy wore as one. My employer was a journeyman, and by having all us boys he was able to get up work very cheap, though he received good wages for it. We boys had no allowance in money, only board, lodging, and clothing. The board was middling, the lodging was too, and there was nothing to complain about in the clothing. He was severe in the way of flogging. I ran away six times myself, but was forced to go back again, as I had no money and no friend in the world. When I first ran away I complained to Mr. ——— the magistrate, and he was going to give me six weeks. He said it would do me good; but Mr. ——— interfered, and I was let go. I don't know what he was going to give me six weeks for, unless it was for having a black eye that my master had given me with the stirrup. Of the seven only one served his time out. He let me off two years before my time was up, as we couldn't agree. The mischief of taking so many apprentices is this:—The master gets money with them from the parish, and can feed them much as he likes as to quality and quantity; and if they run away soon, the master's none the worse, for he 's got the money; and so boys are sent out to turn vagrants when they run away, as such boys have no friends. Of us seven boys (at the wages our employer got) one could earn 19*s.*, another 15*s.*, another 12*s.*, another 10*s.*, and the rest not less than 8*s.* each, for all worked sixteen hours a day—that 's 4*l.* 8*s.* a week for the seven, or 225*l.* 10*s.* a year. You must recollect I reckon this on nearly the best wages in the women's trade. My employer you may call a sweater, and he made money fast, though he drank a good deal. We seldom saw him when he was drunk; but he *did* pitch into us when he was getting sober. Look how easily such a man with apprentices can undersell others when he wants to work as cheap as possible for the great slop warehouses. They serve haberdashers so cheap that oft enough it 's starvation wages for the same shops."

Akin to the system of using a large number of apprentices is that of *employing boys and girls* to displace the work of men, at the less laborious parts of the trade.

"It is probable," said a working shoemaker to me, "that, independent of apprentices, 200 additional hands are added to our already overburdened trade yearly. Sewing boys soon learn the use of the knife. Plenty of poor men will offer to finish them for a pound and a month's work; and men, for a few shillings and a few weeks' work, will teach other boys to sew. There are many of the wives of chamber-masters teach girls entirely to make children's work for a pound and a few months' work, and there are many in Bethnal-green who have learnt the business in this way. These teach some other members of their families, and then actually set up in business in opposition to those who taught them, and in cutting offer their work for sale at a much lower rate of profit; and shopkeepers in town and country, having circulars sent to solicit custom, will have their goods from a warehouse that will serve them cheapest; then the warehouseman will have them cheap from the manufacturer; and he in his turn cuts down the wages of the work-people, who fear to refuse offers at the warehouse price, knowing the low rate at which chamber-masters will serve the warehouse."

As in all trades where lowness of wages is the rule, the boy system of labour prevails among the cheap cabinet-workers. It prevails, however, among the garret-masters, by very many of them having one, two, three or four youths to help them, and so the number of boys thus employed through the whole trade is considerable. This refers principally to the general cabinet trade. In the fancy trade the number is greater, as the boys' labour is more readily available; but in this trade the greatest number of apprentices is employed by such warehousemen as are manufacturers, as some at the East end are, or rather by the men that they constantly keep at work. Of these men, one has now eight and another fourteen boys in his service, some apprenticed, some merely "engaged" and dischargeable at pleasure. A sharp boy, in six or eight months, becomes "handy;" but four out of five of the workmen thus brought up can do nothing well but their own particular branch, and that only well as far as celerity in production is considered.

It is these boys who are put to make, or as a master of the better class distinguished to me, not to *make* but to put together, ladies' work-boxes at 5*d.* a piece, the boy receiving 2½*d.* a box. 'Such boxes,' said another workman, 'are nailed together; there 's no dove-tailing, nothing of what I call *work*, or workmanship, as you say, about them, but the deal 's nailed together, and the veneer 's dabbed on, and if the deal 's covered, why the thing passes. The worst of it is, that people don't understand either good work or good wood. Polish them up and they look well. Besides—and that 's another bad thing, for it encourages bad work—there 's no stress on a lady's work-box, as on a chair or a sofa, and so bad work lasts far too long, though not half so long as good; in solids especially, if not in veneers."

To such a pitch is this demand for children's labour carried, that there is a market in Bethnal-green, where boys and girls stand twice a week to be hired as binders and sewers. Hence it will be easily understood that it is impossible for the

skilled and grown artizan to compete with the labour of mere children, who are thus literally brought into the market to undersell him!

Concerning this market for boys and girls, in Bethnal-green, I received, during my inquiries into the boot and shoe trade, the following statements from shopkeepers on the spot:—

"Mr. H—— has lived there sixteen years. The market-days are Monday and Tuesday mornings, from seven to nine. The ages of persons who assemble there vary from ten to twenty, and they are often of the worst character, and a decideded nuisance to the inhabitants. A great many of both sexes congregate together, and most market days there are three females to one male. They consist of sewing boys, shoe-binders, winders for weavers, and girls for all kinds of slop needle-work, girls for domestic work, nursing children, &c. No one can testify, for a fact, that they (the females) are prostitutes; but, by their general conduct, they are fit for anything. The market, some years since, was held at the top of Abbey-street; but, on account of the nuisance, it was removed to the other end of Abbey-street. When the schools were built, the nuisance became so intolerable that it was removed to a railway arch in White-street, Bethnal-green. There are two policemen on market mornings to keep order, but my informant says they require four to maintain anything like subjection."

But *family work, or the conjoint labour of a workman's wife and children*, is an equally extensive cause of surplus and casual labour.

A small master, working, perhaps, upon goods to be supplied at the lowest rates to wholesale warehousemen, will often contribute to this result by the way in which he brings up his children. It is less expensive to him to teach them his own business, and he may even reap a profit from their labour, than to have them brought up to some other calling. I met with an instance of this in an inquiry among the toy-makers. A maker of common toys brought up five children to his own trade, for boys and girls can be made useful in such labour at an early age. His business fell off rapidly, which he attributed to the great and numerous packages of cheap toys imported from Germany, Holland, and France, after the lowering of the duty by Sir Robert Peel's tariff. The chief profit to the toy-maker was derived from the labour, as the material was of trifling cost. He found, on the change in his trade, that he could not employ all his family. His fellow tradesmen, he said, were in the same predicament; and thus surplus hands were created, so leading to casualty in labour.

"The system which has, I believe, the worst effect on the women's trade in the boot and shoe business throughout England is," I said in the *Morning Chronicle*, "chamber-mastering. There are between 300 and 400 chamber-masters. Commonly the man has a wife, and three or four children, ten years old or upwards. The wife cuts out the work for the binders, the husband does the knife-work, the children sew with uncommon rapidity. The husband, when the work is finished at night, goes out with it, though wet and cold, and perhaps hungry—his wife and children waiting his return. He returns sometimes, having sold his work at cost price, or not cleared 1*s*. 6*d*. for the day's labour of himself and family. In the winter, by this means, the shopkeepers and warehouses can take the advantage of the chamber-master, buying the work at their own price. By this means haberdashers' shops are supplied with boots, shoes, and slippers; they can sell women's boots at 1*s*. 9*d*. per pair; shoes, 1*s*. 3*d*. per pair; children's, 6*d*., 8*d*., and 9*d*. per pair, getting a good profit, having bought them of the poor chamber-master for almost nothing, and he glad to sell them at any price, late at night, his children wanting bread, and he having walked about for hours, in vain trying to get a fair price for them; thus, women and children labour as well as husbands and fathers, and, with their combined labours, they only obtain a miserable living."

The labour of the wife, and indeed the whole family—family work, as it is called—is attended with the same evil to a trade, introducing a large supply of fresh hands to the labour market, and so tending to glut with workpeople each trade into which they are introduced, and thus to increase the casual labour, and decrease the earnings of the whole.

"The only means of escape from the inevitable poverty," I said in the same letters, "which sooner or later overwhelms those in connection with the cheap shoe trade, seems to the workmen to be by the employment of his whole family as soon as his children are able to be put to the trade—and yet this only increases the very depression that he seeks to avoid. I give the statement of such a man residing in the suburbs of London, and working with three girls to help him:—

"'I have known the business,' he said, 'many years, but was not brought up to it. I took it up because my wife's father was in the trade, and taught me. I was a weaver originally, but it is a bad business, and I have been in this trade seventeen years. Then I had only my wife and myself able to work. At that time my wife and I, by hard work, could earn 1*l*. a week; on the same work we could not now earn 12*s*. a week. As soon as the children grew old enough the falling off in the wages compelled us to put them to work one by one—as soon as a child could make threads. One began to do that between eight and nine. I have had a large family, and with very hard work too. We have had to lie on straw oft enough. Now, three daughters, my wife, and myself work together, in chamber-mastering; the whole of us may earn, one week with another, 28*s*. a week, and out of that I have eight to support. Out of that 28*s*. I have to pay for grindery and candles, which cost me 1*s*. a week the year through. I now make children's shoes for the wholesale houses and anybody. About two years ago I travelled from Thomas-street, Bethnal-green, to Oxford-street, "on the

Original from HARVARD UNIVERSITY

hawk." I then positively had nothing in my inside, and in Holborn I had to lean against a house, through weakness from hunger. I was compelled, as I could sell nothing at that end of the town, to walk down to Whitechapel at ten at night. I went into a shop near Mile-end turnpike, and the same articles (children's patent leather shoes) that I received 8*s.* a dozen for from the wholesale houses, I was compelled to sell to the shopkeeper for 6*s.* 6*d.* This is a very frequent case—very frequent—with persons circumstanced as I am, and so trade is injured and only some hard man gains by it.' "

Here is the statement of a worker at "fancy cabinet" work on the same subject:—

"The most on us has got large families. We put the children to work as soon as we can. My little girl began about six, but about eight or nine is the usual age." *"Oh, poor little things," said the wife, "they are obliged to begin the very minute they can use their fingers at all."* "The most of the cabinet-makers of the East end have from five to six in family, and they are generally all at work for them. The small masters mostly marry when they are turned of 20. You see our trade's coming to such a pass, that unless a man has children to help him he can't live at all. *I've worked more than a month together, and the longest night's rest I've had has been an hour and a quarter; aye, and I've been up three nights a week besides.* I've had my children lying ill, and been obliged to wait on them into the bargain. You see, we couldn't live if it wasn't for the labour of our children, though it makes 'em—poor little things!—old people long afore they are growed up."

"Why, I stood at this bench," said the wife, "with my child, only ten years of age, from four o'clock on Friday morning till ten minutes past seven in the evening, without a bit to eat or drink. I never sat down a minute from the time I began till I finished my work, and then I went out to sell what I had done. I walked all the way from here [Shoreditch] down to the Lowther Arcade, to get rid of the articles." *Here she burst out in a violent flood of tears, saying, "Oh, sir, it is hard to be obliged to labour from morning till night as we do, all of us, little ones and all, and yet not be able to live by it either."*

"And you see the worst of it is, this here children's labour is of such value now in our trade, that there's more brought into the business every year, so that it's really for all the world *like breeding slaves.* Without my children I don't know how we should be able to get along." "There's that little thing," said the man, pointing to the girl ten years of age before alluded to, as she sat at the edge of the bed, "why she works regularly every day from six in the morning till ten at night. She never goes to school. We can't spare her. There's schools enough about here for a penny a week, but we could not afford to keep her without working. If I'd ten more children I should be obliged to employ them all the same way, and there's hundreds and thousands of children now slaving at this business. There's the M——'s; they have a family of eight, and the youngest to the oldest of all works at the bench; and the oldest ain't fourteen. I'm sure, of the 2500 small masters in the cabinet line, you may safely say that 2000 of them, at the very least, has from five to six in family, *and that's upwards of 12,000 children that's been put to the trade since prices has come down.* Twenty years ago I don't think there was a child at work in our business; and I am sure there is not a small master now whose whole family doesn't assist him. But what I want to know is, what's to become of the 12,000 children when they're growed up, and come regular into the trade? Here are all my young ones growing up without being taught anything but a business that I know they must starve at."

In answer to my inquiry as to what dependence he had in case of sickness, "Oh, bless you," he said, "there's nothing but the parish for us. I *did* belong to a Benefit Society about four years ago, but I couldn't keep up my payments any longer. I was in the society above five-and-twenty year, and then was obliged to leave it after all. I don't know of one as belongs to any Friendly Society, and I don't think there is a man as can afford it in our trade now. They must all go to the workhouse when they're sick or old."

The following is from a journeyman tailor, concerning the employment of women in his trade:—

"When I first began working at this branch, there were but very few females employed in it: a few white waistcoats were given out to them, under the idea that women would make them cleaner than men—and so indeed they can. But since the last five years the sweaters have employed females upon cloth, silk, and satin waistcoats as well, and before that time the idea of a woman making a cloth waistcoat would have been scouted. But since the increase of the puffing and the sweating system, masters and sweaters have sought everywhere for such hands as would do the work below the regular ones. Hence the wife has been made to compete with the husband, and the daughter with the wife: they all learn the waistcoat business, and must all get a living. If the man will not reduce the price of his labour to that of the female, why he must remain unemployed; and if the full-grown woman will not take the work at the same price as the young girl, why she must remain without any. The female hands, I can confidently state, have been sought out and introduced to the business by the sweaters, from a desire on their part continually to ferret out hands who will do the work cheaper than others. The effect that this continual reduction has had upon me is this: Before the year 1844 I could live comfortably, and keep my wife and children (I had five in family) by my own labour. My wife then attended to her domestic and family duties; but since that time, owing to the reduction in prices, she has been compelled to resort to her needle, as well as myself, for her living." [On the table was a bundle of crape and bombazine ready to be

Original from HARVARD UNIVERSITY

made up into a dress.] "I cannot afford now to let her remain idle—that is, if I wish to live, and keep my children out of the streets, and pay my way. My wife's earnings are, upon an average, 8*s.* per week. She makes dresses. I never would teach her to make waistcoats, because I knew the introduction of female hands had been the ruin of my trade. With the labour of myself and wife now I can only earn 32*s.* a week, and six years ago I could make my 36*s.* If I had a daughter I should be obliged to make her work as well, and then probably, with the labour of the three of us, we could make up at the week's end as much money, as, up to 1844, I could get by my own single hands. My wife, since she took to dressmaking, has become sickly from over-exertion. Her work, and her domestic and family duties altogether, are too much for her. Last night I was up all night with her, and was compelled to call in a female to attend her as well. The over-exertion now necessary for us to maintain a decent appearance, has so ruined her constitution that she is not the same woman as she was. In fact, ill as she is, she has been compelled to rise from her bed to finish a mourning-dress against time, and I myself have been obliged to give her a helping-hand, and turn to at women's work in the same manner as the women are turning to at men's work."

"The cause of the serious decrease in our trade," said another tailor to me, "is the employment given to workmen at their own homes; or, in other words, to the 'sweaters.' The sweater is the greatest evil to us; as the sweating system increases the number of hands to an almost incredible extent—wives, sons, daughters, and extra women, all working 'long days'—that is, labouring from sixteen to eighteen hours per day, and Sundays as well. I date the decrease in the wages of the workman from the introduction of piece-work and giving out garments to be made off the premises of the master; for the effect of this was, that the workman making the garment, knowing that the master could not tell whom he got to do his work for him, employed women and children to help him, and paid them little or nothing for their labour. This was the beginning of the sweating system. The workmen gradually became transformed from journeymen into 'middlemen,' living by the labour of others. Employers soon began to find that they could get garments made at a less sum than the regular price, and those tradesmen who were anxious to force their trade, by underselling their more honourable neighbours, readily availed themselves of this means of obtaining cheap labour. The consequence was, that the sweater sought out where he could get the work done the cheapest, and so introduced a fresh stock of hands into the trade. Female labour, of course, could be had cheaper than male, and the sweater readily availed himself of the services of women on that account. Hence the males who had formerly been employed upon the garments were thrown out of work by the females, and obliged to remain unemployed, unless they would reduce the price of their work to that of the women. It cannot, therefore, be said that the reduction of prices originally arose from there having been more workmen than there was work for them to do. There was no superabundance of hands until female labour was generally introduced—and even if the workmen had increased 25 per cent. more than what they were twenty years back, still that extra number of hands would be required now to make the same number of garments, owing to the work put into each article being at least one-fourth more than formerly. So far from the trade being over-stocked with male hands, if the work were confined to the men or the masters' premises, there would not be sufficient hands to do the whole."

According to the last Census (1841, G.B.), out of a population of 18,720,000 the proportions of the people occupied and unoccupied were as follows:—

Occupied	7,800,000
Unoccupied (including women and children)	10,920,000

Of those who were occupied the following were the proportions:—

Engaged in productive employments *	5,350,000
Engaged in non-productive employments	2,450,000

Of those who were engaged in productive employments, the proportion (in round numbers) ran as follows:—

Men	3,785,000
Women	660,000
Boys and girls	905,000

Here, then, we find nearly one-fifth, or 20 per cent., of our producers to be boys and girls, and upwards of 10 per cent. to be women. Such was the state of things in 1841. In order to judge of the possible and probable condition of the labour market of the country, if this introduction of women and children into the ranks of the labourers be persisted in, let us see what were the proportions of the 10,920,000 men, women, and children who ten years ago still remained unoccupied among us. The ratio was as follows:—

Men	275,000
Women	3,570,000
Boys and girls	7,075,000

Here the unoccupied men are about 5 per cent. of the whole, the children nearly two-thirds, and the wives about one-third. Now it appears that out of say 19,000,000 people, 8,000,000 were, in 1841, occupied, and by far the greater number, 11,000,000, unoccupied.

Who were the remaining eleven millions, and what were they doing? They, of course, consisted principally of the unemployed wives and children of the eight millions of people before specified, three millions and a half of the number

* I have here included those engaged in Trade and Commerce, and employers as well as the employed among the *producers*.

being females of twenty years of age and upwards, and seven millions being children of both sexes under twenty. Of these children, four millions, according to the "age abstract," were under ten years, so that we may fairly assume that, at the time of taking the last census, *there were very nearly seven millions of wives and children of a workable age still unoccupied*. Let us suppose, then, that these seven millions of people are brought in competition with the five million producers. What is to be the consequence? If the labour market be overstocked at present with only five millions of people working for the support of nineteen millions (I speak according to the Census of 1841), what would it be if another seven millions were to be dragged into it? And if wages are low now, and employment is precarious on account of this, what will not both work and pay sink to when the number is again increased, and the people clamouring for employment are at least treble what they are at present? When the wife has been taught to compete for work with the husband, and son and daughter to undersell their own father, what will be the state of our labour market then?

But the labour of wives, and children, and apprentices, is not the only means of glutting a particular trade with hands. There is another system becoming every day more popular with our enterprising tradesmen, and this is the *importation of foreign labourers*. In the cheap tailoring this is made a regular practice. Cheap labour is regularly imported, not only from Ireland (the wives of sweaters making visits to the Emerald Isle for the express purpose), but small armies of working tailors, ready to receive the lowest pittance, are continually being shipped into this country. That this is no exaggeration let the following statement prove:—

"I am a native of Pesth, having left Hungary about eight years ago. By the custom of the country I was compelled to travel three years in foreign parts, before I could settle in my native place. I went to Paris, after travelling about in the different countries of Germany. I stayed in Paris about two years. My father's wish was that I should visit England, and I came to London in June, 1847. I first worked for a West end show shop—not *directly* for them—but through the person who is their middleman getting work done at what rates he could for the firm, and obtaining the prices they allowed for making the garments. I once worked four days and a half for him, finding my own trimmings, &c., for 9*s*. For this my employer would receive 12*s*. 6*d*. He then employed 190 hands; he *has* employed 300. Many of those so employed set their wives, children, and others to work, some employing as many as five hands this way. The middleman keeps his carriage, and will give fifty guineas for a horse. I became unable to work from a pain in my back, from long sitting at my occupation. The doctor told me not to sit much, and so, as a countryman of mine was doing the same, I employed hands, making the best I could of their labour. I have now four young women (all Irish girls) so employed. Last week one of them received 4*s*., another 4*s*. 2*d*., the other two 5*s*. each. They find their board and lodging, but I find them a place to work in, a small room, the rent of which I share with another tailor, who works on his own account. There are not so many Jews come over from Hungary or Germany as from Poland. The law of travelling three years brings over many, but not more than it did. The revolutions have brought numbers this year and last. They are Jew tailors flying from Russian and Prussian Poland to avoid the conscription. I never knew any of these Jews go back again. *There is a constant communication among the Jews, and when their friends in Poland, and other places, learn they are safe in England, and in work and out of trouble, they come over too. I worked as a journeyman in Pesth, and got 2s. 6d. a week, my board and washing, and lodging, for my labour.* We lived well, everything being so cheap. The Jews come in the greatest number about Easter. They try to work their way here, most of them. Some save money here, but they never go back; if they leave England it is to go to America."

The labour market of a particular place, however, comes to be overstocked with hands, not only from the introduction of an inordinate number of apprentices and women and children into the trade, as well as the importation of workmen from abroad, but the same effect is produced by *the migration of country labourers to towns*. This, as I have before said, is specially the case in the printer's and carpenter's trades, where the cheap provincial work is executed chiefly by apprentices, who, when their time is up, flock to the principal towns, in the hopes of getting better wages than can be obtained in the country, owing to the prevalence of the apprentice system of work in those parts. The London carpenters suffer greatly from what are called "improvers," who come up to town to get perfected in their art, and work for little or no wages. The work of some of the large houses is executed mainly in this way; that of Mr. Myers was, for instance, against whom the men lately struck.

But the unskilled labour of towns suffers far more than the skilled from the above cause.

The employment of unskilled labourers in towns is being constantly rendered more casual by the migrations from the country parts. The peasants, owing to the insufficiency of their wages, and the wretchedness of their dwellings and diet, in Wilts, Somerset, Dorset, and elsewhere, leave their native places without regret, and swell the sum of unskilled labour in towns. This is shown by the increase of population far beyond the excess of births over deaths in those counties where there are large manufacturing or commercial towns; whilst in purely agricultural counties the increase of population does not keep pace with the excess of births. "Thus in Lancashire," writes Mr. Thornton, in his work on Over-Population, "the increase of the population in the ten years ending in 1841, was 330,210, and in Cheshire, 60,919; whilst the excess of

births was only 150,150 in the former, and 28,000 in the latter. In particular towns the contrast is still more striking. In Liverpool and Bristol the annual deaths actually exceed the births, so that these towns are only saved from depopulation by their rural recruits, yet the first increased the number of its inhabitants in ten years by more than one-third, and the other by more than one-sixth. In Manchester, the annual excess of births could only have added 19,390 to the population between 1831 and 1841; the actual increase was 68,375. The number of emigrants (immigrants) into Birmingham, during the same period, may, in the same way, be estimated at 40,000; into Leeds, at 8000; into the metropolis, at 130,000. On the other hand, in Dorset, Somerset, and Devon, the actual addition to the population, in the same decennial period, was only 15,491, 31,802, and 39,253 respectively; although the excess of births over deaths in the same counties was about 20,000, 38,600, and 48,700."

The unskilled labour market suffers, again, from the depression of almost any branch of skilled labour; for whatever branch of labour be depressed, and men so be deprived of a sufficiency of employment, one especial result ensues—the unskilled labour market is glutted. The skilled labourer, a tailor, for instance, may be driven to work for the wretched pittance of an East end slop-tailor, but he cannot "turn his hand" to any other description of skilled labour. He cannot say, "I will make billiard-tables, or book-cases, or boots, or razors;" so that there is no resource for him but in unskilled labour. The Spitalfields weavers have often sought dock labour; the turners of the same locality, whose bobbins were once in great demand by the silk-winders, and for the fringes of upholsterers, have done the same; and in this way the increase of casual labour increases the poverty of the poor, and so tends directly to the increase of pauperism.

We have now seen what a vast number of surplus labourers may be produced by an extension of time, rate, or mode of working, as well as by the increase of the hands, by other means than by *the increase of the people themselves.* If, however, we are increasing our workers at a greater rate than we are increasing the means of work, the excess of workmen must, of course, remain unemployed. But are we doing this?

Let us test the matter on the surest data. In the first instance let us estimate the increase of population, both according to the calculations of the late Mr. Rickman and the returns of the several censuses. The first census, I may observe, was taken in 1801, and has been regularly continued at intervals of ten years. The table first given refers to the population of England and Wales:—

INCREASE IN THE POPULATION OF ENGLAND AND WALES.

Years.	Population, England and Wales.	Numerical Increase.	Increase per Cent.	Annual Increase per cent.	Increase per Cent. in 50 Years, from 1801 to 1851 = 101.	Annual average increase per Cent., 1·41.
*1570	4,038,879					
1600	4,811,718	772,839	19	0·6		
1630	5,601,517	789,799	16	0·5		
1670	5,773,646	172,129	3	0·08		
1700	6,045,008	271,362	5	0·2		
1750	6,517,035	472,027	8	0·2		
†1801	8,892,536	2,375,501	37	0·7		
1811	10,164,068	1,271,532	14	1·4		
1821	11,999,322	1,835,250	18	1·8		
1831	13,896,797	1,897,475	16	1·6		
1841	15,914,148	1,982,489	14	1·4		
1851	17,922,768	1,968,341	13	1·3		

* The amount of the population from 1570 to 1750, as here given, is copied from Rickman's tables, as published by the Registrar-General.

† The population at the decennial term, as here given, is the amended calculation of the Registrar-General, as given in the new census tables.

INCREASE IN THE POPULATION OF SCOTLAND.

Years.	Population, Scotland.	Numerical Increase.	Increase per Cent.	Annual Increase per Cent.	Increase per Cent. in 50 years, from 1801 to 1851 = 78.	Annual rate of Increase per Cent., 1·16.
*1755	1,265,380					
†1801	1,608,420	343,040	27	0·6		
1811	1,805,864	197,444	12	1·3		
1821	2,091,512	285,657	16	1·6		
1831	2,364,386	272,865	13	1·3		
1841	2,620,184	255,798	11	1·1		
1851	2,870,784	245,237	10	1·0		

* From returns furnished by the clergy.

† The returns here cited are copied from those given by the Registrar-General in the new census.

d Estimate from incomplete census.
e First complete census.

INCREASE IN THE POPULATION OF THE UNITED KINGDOM.

Years.	Population.	Numerical Increase.	Decennial Increase per Cent.	Annual Increase per Cent.	Increase in 30 years, from 1821 to 1851 = 31 per Cent.	Annual Rate of Increase ·9 per Cent.
1821	20,892,670					
1831	24,028,584	3,135,914	15	1·4		
1841	26,709,456	2,680,872	11	1·1		
1851	27,309,346	599,890	2	0·2		

Discarding, then, all conjectural results, and adhering solely to the returns of the censuses, we find that, according to the official numberings of the people *throughout the kingdom*, the increased rate of population is, in round numbers, 10 per cent. every ten years; that is to say, where 100 persons were living in the United Kingdom in 1821, there are 130 living in the present year of 1851. The average increase in England and Wales for the last 50 years may, however, be said to be 1·5 per cent. per annum, the population having doubled itself during that period.

How, then, does this rate of increase among the people, and consequently the labourers and artizans of the country, correspond with the rate of increase in the production of commodities, or, in plain English, the means of employment? *This* is the main inquiry.

The only means of determining the total amount of commodities produced, and consequently the quantity of work done in the country, is from official returns, submitted to the Parliament and the public as part of the "revenue" of the kingdom. These afford a broad and accurate basis for the necessary statistics; and to get rid of any speculating or calculating on the subject, I will confine my notice to such commodities; giving, however, further information bearing on the subject, but still derived from official sources, so that there may be no doubt on the matter. The facts in connection with this part of the subject are exhibited in the table given in the next page.

The majority of the articles there specified supply the elements of trade and manufacture in furnishing the materials of our clothing, in all its appliances of decency, comfort, and luxury. The table relates, moreover, to our commerce with other countries—to the ships which find profitable employment, and give such employment to our people, in the aggregate commerce of the nation. Under almost every head, it will be seen, the increase in the means of labour has been more extensive than has the increase in the number of labourers; in some instances the difference is wide indeed.

The annual rate of increase among the population has been ·9 per cent. From 1801 to 1841 the population of the kingdom at the outside cannot be said to have doubled itself. Yet the productions in cotton goods *were not less than ten times greater in* 1851 *than in* 1801. The increase in the use of wool from 1821 to 1851 was more than sixfold; that of the population, I may repeat, *not* twofold. In *twenty* years (1831 to 1851) the hides were more than doubled in amount as a means of production; in *fifty* years the population has not increased to the same amount. Can any one, then, contend that the labouring population has extended itself at a greater rate than the means of labour, or that the vast mass of surplus labour throughout the country is owing to the working classes having increased more rapidly than the means of employing them?

Thus, it is evident, that the means of labour

* The *official* value was established long ago; it represents a price put upon merchandise or commodities; it is in reality a fixed value, and serves to indicate the relative extent of imports and exports in different years. The *declared* value is simply the market price.

have increased at a more rapid pace than the labouring population. But the increase in "property" of the country, in that which is sometimes called the "staple" property, being the assured possessions of the class of proprietors or capitalists, as well as in the profits, prove, that, if the labourers of the country have been hungering for want of employment, at least the wealth of the nation has kept pace with the increase of the people, while the profits of trade have exceeded it.

AMOUNT OF THE PROPERTY AND INCOME OF GREAT BRITAIN.

Year.	Property assessed to Property-tax.	Annual Profits of Trade.
1815 . .	£60,000,000	£37,000,000
1842 . .	95,250,000	
1844 . .	......	60,000,000
Increase . .	58 per cent.	
„ . .	......	62 per cent.
Annual rate of increase . . .	1·7 per cent.	1·7 per cent.

Here, then, we find, that the property assessed to the property tax has increased 35,250,000*l.* in 27 years, from 1815 to 1842, or upwards of 1,000,000*l.* sterling a year; this is at the rate of 1·7 per cent. every year, whereas the population of Great Britain has increased at the rate of only 1·4 per cent. per annum. But the amount of assessment under the property tax, it should be borne in mind, does not represent the full value of the possessions, so that among this class of proprietors there is far greater wealth than the returns show.

As regards the annual profits of trade, the increase between the years 1815 and 1844 has been 23,000,000*l.* in 29 years. This is at the rate of 1·7 per cent. per annum, and the annual increase in the population of Great Britain is only 1·4 per cent. But the amount of the profits of trade is unquestionably greater than appears in the financial tables of the revenue of the country; consequently there is a greater increase of wealth over population than the figures indicate.

The above returns show the following results:—

	Increase per Cent. per Ann.
Population of the United Kingdom .	·9
Productions from	21 to 5
Exports	14
Imports	5
Shipping entering Ports . . .	9
Property	1·7
Profits of trade	1·7

Far, very far indeed then, beyond the increase of the population, has been the increase of the wealth and work of the country.

And now, after this imposing array of wealth, let us contemplate the reverse of the picture: let us inquire if, while we have been increasing in riches and productions far more rapidly than we have been increasing in people and producers—let us inquire, I say, if we have been numerically increasing also in the sad long lists of paupers and criminals. Has our progress in poverty and crime been "*pari passu*," or been more than commensurate in the rapidity of its strides?

TABLE SHOWING THE NUMBER OF PAUPERS IN ENGLAND AND WALES.*

Years.	Number of Paupers relieved, Quarters ending Lady-day.	Numerical Increase and Decrease. † denotes Increase. * ,, Decrease.	Annual Increase and Decrease per Cent.	
1840	1,199,529			Increase per Cent. from 1840 to 1848 = 56. Annual Increase, 7 per Cent.
1841	1,299,048	† 99,519	† 7·8	
1842	1,427,187	†128,139	†10	
1843	1,539,490	†112,303	† 8	
1844	1,477,561	†938,071	†60	
1845	1,470,970	* 6,591	* 0·4	
1846	1,332,089	* 38,881	* 3	
1847	1,721,350	†389,261	†29	
1848	1,876,541	†155,191	† 9	

Here, then, we have an increase of 56 per cent. in less than ten years, though the increase of the population of England and Wales, in the same time, was but 13 per cent.; and let it be remembered that the increase of upwards of 650,000 paupers, in nine years, has accrued since the New Poor Law has been in what may be considered full working; a law which many were confident would result in a diminution of pauperism, and which certainly cannot be charged with offering the least encouragement to it. Still in *nine* years, our poverty increases while our wealth increases, and our paupers grow nearly four times as quick as our people, while the profits on trade nearly double themselves in little more than a quarter of a century.

We now come to the records of criminality:—

TABLE SHOWING THE INCREASE IN THE NUMBER OF CRIMINALS IN ENGLAND AND WALES FROM 1805–1850.

	Annual Average Number of Criminals Committed.	Numerical Increase.	Decennial Increase per Cent.	Annual Increase per Cent.	Increase per Cent. in the 45 years.	
1805	4,605					Annual Average Increase per Cent., 11·7.
1811	5,375	770	17	2·8		
1821	9,783	4408	82	8·2	504	
1831	15,318	5535	57	5·7		
1841	22,305	6987	46	4·6		
1850	27,814	5509	25	3·6		

From these results—and such figures are facts, and therefore stubborn things—the people cannot be said to have increased beyond the wealth or the means of employing them, for it is evident that *we increase in poverty and crime as we increase in wealth, and in both far beyond our increase in numbers.* The above are the bare facts of the country—it is for the reader to explain them as he pleases.

As yet we have dealt with those causes of casual labour only which may induce a surplusage of labourers without any *decrease taking place in the quantity of work.* We have seen, first, how the number of the unemployed may be increased either by altering the hours, rate, or mode of working, or else by changing the term of hiring, and this while the number of labourers remains the same; and, secondly, we have seen how the same results may ensue from increasing the number of labourers, while the conditions of working and hiring are unaltered. Under both these circumstances, however, the actual quantity of work to be done in the country has been supposed to undergo no change whatever; and at present we have to point out not only how the amount of surplus, and, consequently, of casual labour, in the kingdom, may be increased by *a decrease of the work*, but also how the work itself may be made to decrease. To know the causes of the one we must ascertain the antecedents of the other. What, then, are the circumstances inducing a decrease in the quantity of work? and,

* The official returns as to the number of paupers are most incomplete and unsatisfactory. In the 10th annual Report of the Poor Law Commissioners, p. 480 (1844), a table is printed which is said to give the returns from the earliest period for which authentic Parliamentary documents have been received, and this sets forth the number of paupers in England and Wales, for the *entire twelve months* in the years 1803, 1813, 1814, and 1815; then comes a long interval of "no returns," and after 1839 we have the numbers for only *three months* in each year, from 1840 up to 1843; in the first annual Report (1848) these returns for one quarter in each year are continued up to 1848; and then we get the returns for only two days in each year, the 1st of July and the 1st of January, so that to come to any conclusion amid so much inconsistency is utterly impossible. The numbers above given would have been continued to the present period, could any comparison have been instituted. The numbers for the periods (not above given) are—

1803	1,040,716	Number of paupers for the entire twelve months.
1813	1,426,065	
1814	1,402,576	
1815	1,319,851	
1849 (1st Jan.)	940,851	Number of paupers for two separate days in each year.
,, (1st July)	846,988	
1850 (1st Jan.)	899,830	
,, (1st July)	796,318	
1851 (1st Jan.)	829,440	

consequently, what the circumstances inducing an increase in the amount of surplus and casual labour?

In the first place we may induce a large amount of casual labour *in particular districts*, not by decreasing the gross quantity of work required by the country, but by merely shifting the work into new quarters, and so decreasing the quantity in the ordinary localities. "The west of England," says Mr. Dodd, in his account of the textile manufactures of Great Britain, "was formerly, and continued to be till a comparatively recent period, the most important clothing district in England. The changes which the woollen manufacture, as respects both localization and mode of management, has been and is now undergoing, are very remarkable. Some years ago the 'west of England cloths' were the test of excellence in this manufacture; while the productions of Yorkshire were deemed of a coarser and cheaper character. At present, although the western counties have not deteriorated in their product, the West Riding of Yorkshire has made giant strides, by which equal skill in every department has been attained; while the commercial advantages resulting from coal-mines, from water-power, from canals and railroads, and from vicinage to the eastern port of Hull and the western port of Liverpool, give to the West Riding a power which Gloucestershire and Somersetshire cannot equal. The steam-engine, too, and various machines for facilitating some of the manufacturing processes, have been more readily introduced into the former than into the latter; a circumstance which, even without reference to other points of comparison, is sufficient to account for much of the recent advance in the north."

Of late years the products of many of the west of England clothing districts have considerably declined. Shepton Mallet, Frome and Trowbridge, for instance, which were at one time the seats of a flourishing manufacture for cloth, have now but little employment for the workmen in those parts; and so with other towns. "At several places in Wiltshire, Somersetshire, and Gloucestershire, and others of the western counties," says Mr. Thornton, "most of the cottagers, fifty years ago, were weavers, whose chief dependence was their looms, though they worked in the field at harvest time and other busy seasons. By so doing they kept down the wages of agricultural labourers, who had no other employment; and now that they have themselves become dependent upon agriculture, in consequence of the removal of the woollen manufacture from the cottage to the factory" [as well as to the north of England], "these reduced wages have become their own portion also;" or, in other words, since the shifting of the woollen manufacture in these parts, the quantity of casual labour in the cultivation of the land has been augmented.

The same effect takes place, of course, if the work be shifted to the Continent, instead of merely to another part of our own country. This has been the main cause of the misery of the straw-plaiters of Buckinghamshire and Bedfordshire. "During the last war," says the author before quoted, "there were examples of women (the wives and children of labouring men) earning as much as 22*s.* a week. The profits of this employment have been so much reduced by the competition of Leghorn hats and bonnets, that a straw-plaiter cannot earn much more than 2*s.* 6*d.* in the week."

But the work of particular localities may not only decrease, and the casual labour, in those parts, increase in the same proportion, by shifting it to other localities (either at home or abroad), even while the gross quantity of work required by the nation remains the same, but the quantity of work may be less than ordinary at *a particular time*, even while the same gross quantity annually required undergoes no change. This is the case in those periodical gluts which arise from over-production, in the cotton and other trades. The manufacturers, in such cases, have been increasing the supplies at a too rapid rate in proportion to the demand of the markets, so that, though there be no decrease in the requirements of the country, there ultimately accrues such a surplus of commodities beyond the wants and means of the people, that the manufacturers are compelled to stop producing until such time as the regular demand carries off the extra supply. And during all this time either the labourers have to work half-time at half-pay, or else they are thrown out of employment altogether.

Thus far we have proceeded in the assumption that the actual quantity of work required by the nation *does not decrease in the aggregate, but only in particular places or at particular times*, owing to a greater quantity than usual being done in other places or at other times *. We have still to consider what are the circumstances which tend to *diminish the gross quantity of work required by the country.* To understand these we must know the conditions on which all work depends; these are simply the conditions of demand and supply, and hence to know what it is that regulates the demand for commodities, and what it is that regulates the supply of them, is also to know what it is that regulates the quantity of work required by the nation.

Let me begin with the decrease of work arising from a *decrease of the demand* for certain commodities. This decrease of demand may proceed from one of three causes:—

1. An increase of cost.
2. A change of taste or fashion.
3. A change of circumstances.

The *increase of cost* may be brought about either by an increase in the expense of production or by a tax laid upon the article, as in the case of hair-powder, before quoted. Of the *change of taste or fashion*, as a means of decreasing the

* It might at first appear that, when the work is shifted to the Continent, there would be a proportionate decrease of the aggregate quantity at home, but a little reflection will teach us that the foreigners must take something from us in *exchange* for their work, and so increase the quantity of our work in certain respects as much as they depress it in others.

demand for a certain article of manufacture, and, consequently, of a particular form of labour, many instances have already been given; to these the following may be added:—"In Dorsetshire," says Mr. Thornton, "the making of wire shirt-buttons (now in a great measure superseded by the use of mother-o'-pearl) once employed great numbers of women and children." So it has been with the manufacture of metal coat-buttons; the change to silk has impoverished hundreds.

The decrease of work arising from a *change of circumstances* may be seen in the fluctuations of the iron trade; in the railway excitement the demand for labour in the iron districts was at least tenfold as great as it is at present, and so again with the demand for arms during war time; at such periods the quantity of work in that particular line at Birmingham is necessarily increased, while the contrary effects, of course, ensue immediately the requirements cease, and a large mass of surplus and casual hands is the result. It is the same with the soldiers themselves, as with the gun and sword makers; on the disbanding of certain portions of the army at the conclusion of a war, a vast amount of surplus labourers are poured into the country to compete with those already in work, and either to drag down their weekly earnings, or else, by obtaining *casual* employment in their stead, to reduce the gross quantity of work accruing to each, and so to render their incomes not only less in amount but less constant and regular. Within the last few weeks no less than 1000 policemen employed during the Exhibition have been discharged, of course with a like result to the labour market.

The circumstances tending to *diminish the supply* of certain commodities, are—

1. Want of capital.
2. Want of materials.
3. Want of labourers.
4. Want of opportunity.

The *decrease of the quantity of capital* in a trade may be brought about by several means: it may be produced by a want of security felt among the moneyed classes, as at the time of revolutions, political agitations, commercial depressions, or panics; or it may be produced by a deficiency of enterprise after the bursting of certain commercial "bubbles," or the decline of particular manias for speculation, as on the cessation of the railway excitement; so, again, it may be brought about by a failure of the ordinary produce of the year, as with bad harvests.

The *decrease of the quantity of materials*, as tending to diminish the supply of certain commodities, may be seen in the failure of the cotton crops, which, of course, deprive the cotton manufacturers of their ordinary quantity of work. The same diminution in the ordinary supply of particular articles ensues when the men engaged in the production of them "strike" either for an advance of wages, or more generally to resist the attempt of some cutting employer to reduce their ordinary earnings; and lastly, a like decrease of work necessarily ensues when the *opportunity of working is changed*. Some kinds of work, as we have already seen, depend on the weather—on either the wind, rain, or temperature; while other kinds can only be pursued at certain seasons of the year, as brick-making, building, and the like; hence, on the cessation of the opportunities for working in these trades, there is necessarily a great decrease in the quantity of work, and consequently a large increase in the amount of surplus and therefore casual labour.

We have now, I believe, exhausted the several causes of that vast national evil—casual labour. We have seen that it depends,

First, upon certain times and seasons, fashions and accidents, which tend to cause a periodical briskness or slackness in different employments;

And secondly, upon the number of surplus labourers in the country.

The circumstances inducing surplus labour we have likewise ascertained to be three.

1. An alteration in the hours, rate, or mode of working, as well as in the mode of hiring.
2. An increase of the hands.
3. A decrease of the work, either in particular places, at particular times, or in the aggregate, owing to a decrease either in the demand or means of supply.

Any one of these causes, it has been demonstrated, must necessarily tend to induce an over supply of labourers and consequently a casualty of labour, for it has been pointed out that an over supply of labourers does not depend *solely* on an increase of the workers beyond the means of working, but that a decrease of the ordinary quantity of work, or a general increase of the hours or rate of working, or an extension of the system of production, or even a diminution of the term of hiring, will also be attended with the same result—facts which should be borne steadily in mind by all those who would understand the difficulties of the times, and which the "economists" invariably ignore.

On a careful revision of the whole of the circumstances before detailed, I am led to believe that there is considerable truth in the statement lately put forward by the working classes, that only one-third of the operatives of this country are fully employed, while another third are partially employed, and the remaining third wholly unemployed; that is to say, estimating the working classes as being between four and five millions in number, I think we may safely assert—considering how many depend for their employment on particular times, seasons, fashions, and accidents, and the vast quantity of over-work and scamp-work in nearly all the cheap trades of the present day, the number of women and children who are being continually drafted into the different handicrafts with the view of reducing the earnings of the men, the displacement of human labour in some cases by machinery, and the tendency to increase the division of labour, and to extend the large system of production beyond the requirements of the

markets, as well as the temporary mode of hiring —all these things being considered, I say I believe we may safely conclude that, out of the four million five hundred thousand people who have to depend on their industry for the livelihood of themselves and families, there is (owing to the extraordinary means of economizing labour which have been developed of late years, and the discovery as to how to do the work of the nation with fewer people) barely sufficient work for the *regular* employment of half of our labourers, so that only 1,500,000 are fully and constantly employed, while 1,500,000 more are employed only half their time, and the remaining 1,500,000 wholly unemployed, obtaining a day's work *occasionally* by the displacement of some of the others.

Adopt what explanation we will of this appalling deficiency of employment, one thing at least is certain: we cannot *consistently with the facts of the country*, ascribe it to an increase of the population beyond the means of labour; for we have seen that, while the people have increased during the last fifty years at the rate of ·9 per cent. per annum, the wealth and productions of the kingdom have far exceeded that amount.

Of the Casual Labourers among the Rubbish-Carters.

The casual labour of so large a body of men as the rubbish-carters is a question of high importance, for it affects the whole unskilled labour market. And this is one of the circumstances distinguishing unskilled from skilled labour. Unemployed cabinet-makers, for instance, do not apply for work to a tailor; so that, with skilled labourers, only one trade is affected in the slack season by the scarcity of employment among its operatives. With unskilled labourers it is otherwise. If in the course of next week 100 rubbish-carters were from any cause to be thrown out of employment, and found an impossibility to obtain work at rubbish-carting, there would be 100 fresh applicants for employment among the bricklayer's-labourers, scavagers, nightmen, sewermen, dock-workers, lumpers, &c. Many of the 100 thus unemployed would, of course, be willing to work at reduced wages merely that they might subsist; and thus the hands employed by the regular and "honourable" part of those trades are exposed to the risk of being underworked, as regards wages, from the surplusage of labour in other unskilled occupations.

The employment of the rubbish-carters depends, in the first instance, upon the *season*. The services of the men are called into requisition when houses are being built or removed. In the one case, the rubbish-carters cart away the refuse earth; in the other they remove the old materials. The *brisk season* for the builders, and consequently for the rubbish-carters, is, as I heard several of them express it, "when days are long." From about the middle of April to the middle of October is the *brisk* season of the rubbish-carters, for during those six months more buildings are erected than in the winter half of the year. There is an advantage in fine weather in the masonry becoming *set;* and efforts are generally made to complete at least the carcase of a house before the end of October, at the latest.

I am informed that the difference in the employment of labourers about buildings is 30 per cent.—one builder estimated it at 50 per cent.—less in winter than in summer, from the circumstance of fewer buildings being then in the course of erection. It may be thought that, as rubbish-carters are employed frequently on the foundation of buildings, their business would not be greatly affected by the season or the weather. But the work is often more difficult in wet weather, the ground being heavier, so that a smaller extent of work only can be accomplished, compared to what can be done in fine weather; and an employer may decline to pay six days' wages for work in winter, which he might get done in five days in summer. If the men work by the piece or the load the result is the same; the rubbish-carter's employer has a smaller return, for there is less work to be charged to the customer, while the cost in keeping the horses is the same.

Thus it appears that under the most favourable circumstances about *one-fourth* of the rubbish-carters, even in the honourable trade, may be exposed to the evils of non-employment merely from the state of the weather influencing, more or less, the custom of the trade, and this even during *the* six months' employment out of the year; after which the men must find some other means of earning a livelihood.

There are, in round numbers, 850 operative rubbish-carters employed in the brisk season throughout the metropolis; hence 212 men, at this calculation, would be regularly deprived of work every year for six months out of the twelve. It will be seen, however, on reference to the table here given, that the average number of weeks each of the rubbish-carters is employed throughout the twelve months is far below 26; indeed many have but three and four weeks work out of the 52.

By an analysis of the returns I have collected on this subject I find the following to have been the actual term of employment for the several rubbish-carters in the course of last year:—

Men.		Employment in the Year.			
9	had	39	weeks, or	9	months.
214	„	26	„	6	„
4	„	20	„	5	„
10	„	18	„

Hence about one-fourth of the trade appear to have been employed for six months, while upwards of one-half had work for only three months or less throughout the year—many being at work only three days in the week during that time.

The rubbish-carter is exposed to another casualty over which he can no more exercise control than he can over the weather; I mean to what is generally called *speculation*, or a rage for building. This is evoked by the state of the money market, and other causes upon which I need not dilate; but the effect of it upon the labourers I am describing is this: capitalists may in one year embark sufficient means in building speculations to erect, say 500 new houses, in any particular district. In the following year they may not erect more than 200 (if any), and thus, as there is the same extent of unskilled labour in the market, the number of hands required is, if the trade be generally less speculative, less in one year than in its predecessor by the number of rubbish-carters required to work at the foundations of 300 houses. Such a cause may be exceptional; but during the last ten years the inhabited houses in the five districts of the Registrar-General have increased to the extent of 45,000, or from 262,737 in 1841, to 307,722 in 1851. It appears, then, that the annual increase of our metropolitan houses, concluding that they increase in a regular yearly ratio, is 4500. Last year, however, as I am informed by an experienced builder, there were rather fewer buildings erected (he spoke only from his own observations and personal knowledge of the business) than the yearly average of the decennial term.

The casual and constant wages of the rubbish-carters may be thus detailed. The whole system of the labour, I may again state, must be regarded as *casual*, or—as the word imports in its derivation from the Latin *casus*, a chance—the labour of men who are occasionally employed. Some of the most respectable and industrious rubbish-carters with whom I met, told me they generally might make up their minds, though they might have excellent masters, to be six months of the year unemployed at rubbish-carting; this, too, is less than the average of this chance employment.

Calculating, then, the rubbish-carter's receipt of *nominal wages* at 18*s*., and his *actual wages* at 20*s*. in the honourable trade, I find the following amount to be paid.

By nominal wages, I have before explained, I mean what a man is *said* to receive, or has been *promised* that he shall be paid weekly. Actual wages, on the other hand, are what a man positively *receives*, there being sometimes additions in the form of perquisites or allowances; sometimes deductions in the way of fines and stoppages; the additions in the rubbish-carting trade appear to average about 2*s*. a week. But these *actual wages* are received only so long as the men are employed, that is to say, they are the *casual* rather than the *constant* earnings of the men working at a trade, which is essentially of an occasional or temporary character; the average employment at rubbish-carting being only three months in the year.

Let us see, therefore, what would be the constant earnings or income of the men working at the better-paid portion of the trade.

	£	*s.*	*d.*
The gross actual wages of ten rubbish-carters, casually employed for 39 weeks, at 20*s*. per week, amount to	390	0	0
The gross actual wages of 250 rubbish-carters, casually employed for 26 weeks, at 20*s*. per week .	6500	0	0
The gross actual wages of 360 rubbish-carters, casually employed for 13 weeks, at 20*s*. per week .	4600	0	0
Total gross actual wages of 620 of the better-paid rubbish-carters .	11,490	0	0

But this, as I said before, represents only the *casual* wages of the better-paid operatives—that is to say, it shows the amount of money or money's worth that is positively received by the men while they are in employment. To understand what are the *constant* wages of these men, we must divide their gross casual earnings by 52, the number of weeks in the year: thus we find that the constant wages of the ten men who were employed for 39 weeks, were 15*s*. instead of 20*s*. per week—that is to say, their wages, equally divided throughout the year, would have yielded that constant weekly income. By the same reasoning, the 20*s*. per week casual wages of the 250 men employed for 26 weeks out of the 52, were equal to only 10*s*. constant weekly wages; and so the 360 men, who had 20*s*. per week casually for only three months in the year, had but 5*s*. a week *constantly* throughout the whole year. Hence we see the enormous difference there may be between a man's casual and his constant earnings at a given trade.

The next question that forces itself on the mind is, how do the rubbish-carters live when no longer employed at this kind of work?

When the slack season among rubbish-carters commences, nearly one-fifth of the operatives are discharged. These take to scavaging or dustman's work, as well as that of navigators, or, indeed, any form of unskilled labour, some obtaining full employ, but the greater part being able to "get a job only now and then." Those masters who keep their men on throughout the year are some of them large dust contractors, some carmen, some dairymen, and (in one or two instances in the suburbs, as at Hackney) small farmers. The dust-contractors and carmen, who are by far the more numerous, find employment for the men employed by them as rubbish-carters in the season, either at the dust-yard or carrying sand, or, indeed, carting any materials they may have to move—the wages to the men remaining the same; indeed such is the transient character of the rubbish-carting trade, that there are no masters or operatives who devote themselves solely to the business.

THE EFFECTS OF CASUAL LABOUR IN GENERAL.

HAVING now pointed out the causes of casual labour, I proceed to set forth its effects.

All casual labour, as I have said, is necessarily *uncertain* labour; and wherever uncertainty exists, there can be no foresight or pro-vidence. Had the succession of events in nature been irregular,—had it been ordained by the Creator that similar causes under similar circumstances should *not* be attended with similar effects,—it would have been impossible for us to have had any knowledge of the future, or to have made any preparations concerning it. Had the seasons followed each other fitfully,—had the sequences in the external world been variable instead of invariable, and what are now termed "constants" from the regularity of their succession been changed into inconstants,—what provision could even the most prudent of us have made? Where all was dark and unstable, we could only have guessed instead of reasoned as to what was to come; and who would have deprived himself of present enjoyments to avoid future privations, which could appear neither probable nor even possible to him? Pro-vidence, therefore, is simply the result of certainty, and whatever tends to increase our faith in the uniform sequences of outward events, as well as our reliance on the means we have of avoiding the evils connected with them, necessarily tends to make us more prudent. Where the means of sustenance and comfort are fixed, the human being becomes conscious of what he has to depend upon; and if he feel *assured* that such means may fail him in old age or in sickness, and be fully impressed with the *certainty* of suffering from either, he will immediately proceed to make some provision against the time of adversity or infirmity. If, however, his means be *uncertain*—abundant at one time, and deficient at another—a spirit of speculation or gambling with the future will be induced, and the individual get to believe in "luck" and "fate" as the arbiters of his happiness rather than to look upon himself as "the architect of his fortunes"—trusting to "chance" rather than his own powers and foresight to relieve him at the hour of necessity. The same result will necessarily ensue if, from defective reasoning powers, the ordinary course of nature be not sufficiently apparent to him, or if, being in good health, he grow too confident upon its continuance, and, either from this or other causes, is led to believe that death will overtake him before his powers of self-support decay.

The ordinary effects of uncertain labour, then, are to drive the labourers to improvidence, recklessness, and pauperism.

Even in the classes which we do not rank among labourers, as, for instance, authors, artists, musicians, actors, uncertainty or irregularity of employment and remuneration produces a spirit of wastefulness and carelessness. The steady and daily accruing gains of trade and of some of the professions form a certain and staple income; while in other professions, where a large sum may be realized at one time, and then no money be earned until after an interval, incomings are rapidly spent, and the interval is one of suffering. This is part of the very nature, the very essence, of the casualty of employment and the delay of remuneration. The past privation gives a zest to the present enjoyment; while the present enjoyment renders the past privation faint as a remembrance and unimpressive as a warning. "Want of providence," writes Mr. Porter, "on the part of those who live by the labour of their hands, and whose employments so often depend upon circumstances beyond their control, is a theme which is constantly brought forward by many whose lot in life has been cast beyond the reach of want. It is, indeed, greatly to be wished, for their own sakes, that the habit were general among the labouring classes of saving some part of their wages when fully employed, against less prosperous times; but it is difficult for those who are placed in circumstances of ease to *estimate the amount of virtue that is implied in this self-denial.* It must be a hard trial for one who has recently, perhaps, seen his family enduring want, to deny them the small amount of indulgences, which are, at the best of times, placed within their reach."

It is easy enough for men in smooth circumstances to say, "the privation is a man's own fault, since, to avoid it, he has but to apportion the sum he may receive in a lump over the interval of non-recompense which he knows will follow." Such a course as this, experience and human nature have shown not to be easy—perhaps, with a few exceptions, not to be possible. It is the starving and not the well-fed man that is in danger of surfeiting himself. When pestilence or revolution are rendering life and property *casualties* in a country, the same spirit of improvident recklessness breaks forth. In London, on the last visitation of the plague, in the reign of Charles II., a sort of Plague Club indulged in the wildest excesses in the very heart of the pestilence. To these orgies no one was admitted who had not been bereft of some relative by the pest. In Paris, during the reign of terror in the first revolution, the famous Guillotine Club was composed of none but those who had lost some near relative by the guillotine. When they met for their half-frantic revels every one wore some symbol of death: breast pins in the form of guillotines, rings with death's-heads, and such like. The duration of their own lives these Guillotine Clubbists knew to be uncertain, not merely in the ordinary uncertainty of nature, but from the character of the times; and this feeling of the jeopardy of existence, from the practice of violence and bloodshed, wrought the effects I have described. Life was more than naturally casual. When the famine was at the worst in Ireland, it was remarked in the *Cork Examiner*, that in that city there never had been seen more street "larking" or street gambling among the poor lads and young men who were really starving. This was a natural result of the casualty of labour and the consequent casualty of food. Persons, it should be remembered, do not insure houses or shops that

Original from HARVARD UNIVERSITY

are "doubly or trebly hazardous;" they gamble on the uncertainty.

Mr. Porter, in his "Progress of the Nation," cites a fact bearing immediately upon the present subject.

"The formation of a canal, which has been in progress during the last five years, in the north of Ireland (this was written in 1847), has afforded steady employment to a portion of the peasantry, who before that time were suffering all the evils, so common in that country, which result from the precariousness of employment. Such work as they could previously get came at uncertain intervals, and was sought by so many competitors, that the remuneration was of the scantiest amount. In this condition of things the men were improvident, to recklessness; their wages, insufficient for the comfortable sustenance of their families, were wasted in procuring for themselves a temporary forgetfulness of their misery at the whiskey-shop, and the men appeared to be sunk into a state of hopeless degradation. From the moment, however, that work was offered to them which was *constant in its nature and certain in its duration*, and on which their weekly earnings would be sufficient to provide for their comfortable support, *men who had been idle and dissolute were converted into sober hard-working labourers, and proved themselves kind and careful husbands and fathers;* and it is stated as a fact, that, notwithstanding the distribution of several hundred pounds weekly in wages, the whole of which must be considered as so much additional money placed in their hands, the consumption of whiskey was absolutely and *permanently* diminished in the district. During the comparatively short period in which the construction of this canal was in progress, some of the most careful labourers—men who most probably before then never knew what it was to possess five shillings at any one time—saved sufficient money to enable them to emigrate to Canada."

There can hardly be a stronger illustration of the blessing of constant and the curse of casual labour. We have competence and frugality as the results of one system; poverty and extravagance as the results of the other; and among the very same individuals.

In the evidence given by Mr. Galloway, the engineer, before a parliamentary committee, he remarks, that "when employers are competent to show their men that their business is *steady and certain*, and when men find that they are likely to have *permanent* employment, they have always *better habits and more settled notions*, which will make them *better men* and *better workmen*, and will produce great benefits to all who are interested in their employment."

Moreover, even if payment be assured to a working man regularly, *but deferred for long intervals*, so as to make the returns lose all appearance of regularity, he will rarely be found able to resist the temptation of a tavern, and, perhaps, a long-continued carouse, or of some other extravagance to his taste, when he receives a month's dues at once. I give an instance of this in the following statement:—

For some years after the peace of 1815 the staffs of the militias were kept up, but not in any active service. During the war the militias performed what are now the functions of the regular troops in the three kingdoms, their stations being changed more frequently than those of any of the regular regiments at the present day. Indeed, they only differed from the "regulars" in name. There was the same military discipline, and the sole difference was, that the militia-men—who were balloted for periodically—could not, by the laws regulating their embodiment, be sent out of the United Kingdom for purposes of warfare. The militias were embodied for twenty-eight days' training, once in four years (seldom less) after the peace, and the staff acted as the drill sergeants. They were usually steady, orderly men, working at their respective crafts when not on duty after the militia's disembodiment, and some who had not been brought up to any handicraft turned out—perhaps from their military habits of early rising and orderliness—very good gardeners, both on their own account and as assistants in gentlemen's grounds. No few of them saved money. Yet these men, with very few exceptions, when they received a month's pay, fooled away a part of it in tippling and idleness, to which they were not at all addicted when attending regularly to their work with its regular returns. If they got into any trouble in consequence of their carousing, it was looked upon as a sort of legitimate excuse, "Why you see, sir, it was the 24th" (the 24th of each month being the pension day).

The thoughtless extravagance of sailors when, on their return to port, they receive in one sum the wages they have earned by severe toil amidst storms and dangers during a long voyage, I need not speak of; it is a thing well known.

These soldiers and seamen cannot be said to have been *casually* employed, but the results were the same as if they had been so employed; the money came to them in a lump at so long an interval as to appear uncertain, and was consequently squandered.

I may cite the following example as to the effects of uncertain earnings upon the household outlay of labourers who suffer from the casualties of employment induced by the season of the year. "In the long fine days of summer, the little daughter of a working brickmaker," I was told, "used to order chops and other choice dainties of a butcher, saying, 'Please, sir, father don't care for the price just a-now; but he must have his chops good; line-chops, sir, and tender, please—'cause he's a brickmaker.' In the winter, it was, 'O please, sir, here's a fourpenny bit, and you must send father something cheap. He don't care what it is, so long as it's cheap. It's winter, and he hasn't no work, sir—'cause he's a brickmaker.'"

I have spoken of the tendency of casual labour to induce intemperate habits. In confirmation of this I am enabled to give the following account as to the increase of the sale of malt liquor in the metropolis *consequent upon wet weather*. The account is derived from the personal observations of a gentleman long familiar with the brewing

trade, in connection with one of the largest houses. In short, I may state that the account is given on the very best authority.

There are *nine* large brewers in London; of these the two firms transacting the greatest extent of business supply, daily, 1000 barrels each firm to their customers; the seven others, among them, dispose, altogether, of 3000 barrels daily. All these 5000 barrels a day are solely for town consumption; and this may be said to be the *average* supply the year through, but the public-house sale is far from regular.

After a wet day the sale of malt liquor, principally beer (porter), to the metropolitan retailers is from 500 to 1000 barrels more than when a wet day has not occurred; that is to say, the supply increases from 5000 barrels to 5500 and 6000. Such of the publicans as keep small stocks go the next day to their brewers to order a further supply; those who have better-furnished cellars may not go for two or three days after, but the result is the same.

The reason for this increased consumption is obvious; when the weather prevents workmen from prosecuting their respective callings in the open air, they have recourse to drinking, to pass away the idle time. Any one who has made himself familiar with the habits of the working classes has often found them crowding a public-house during a hard rain, especially in the neighbourhood of new buildings, or any public open-air work. The street-sellers, themselves prevented from plying their trades outside, are busy in such times in the "publics," offering for sale braces, belts, hose, tobacco-boxes, nuts of different kinds, apples, &c. A bargain may then be struck for so much and a half-pint of beer, and so the consumption is augmented by the trade in other matters.

Now, taking 750 barrels as the average of the extra sale of beer in consequence of wet weather, we have a consumption beyond the demands of the ordinary trade in malt liquor of 27,000 gallons, or 216,000 pints. This, at 2*d*. a pint, is 1800*l*. for a day's needless, and often prejudicial, outlay caused by the casualty of the weather and the consequent casualty of labour. A censor of morals might say that these men should go home under such circumstances; but their homes may be at a distance, and may present no great attractions; the single men among them may have no homes, merely sleeping-places; and even the more prudent may think it advisable to wait awhile under shelter in hopes of the weather improving, so that they could resume their labour, and only an hour or so be deducted from their wages. Besides, there is the attraction to the labourer of the warmth, discussion, freedom, and excitement of the public-house.

That the great bulk of the consumers of this *additional* beer are of the classes I have mentioned is, I think, plain enough, from the increase being experienced only in that beverage, the consumption of gin being little affected by the same means. Indeed, the statistics showing the ratio of beer and gin-drinking are curious enough (were this the place to enter into them), the most gin, as a general rule, being consumed in the most depressed years.

"It is a fact worth notice," said a statistical journal, entitled "Facts and Figures," published in 1841, "as illustrative of the *tendency of the times of pressure to increase spirit drinking*, that whilst under the privations of last year (1840) the poorer classes paid 2,628,286*l*. tax for spirits; in 1836, a year of the greatest prosperity, the tax on British spirits amounted only to 2,390,188*l*. *So true is it that to impoverish is to demoralise*."

The numbers who imbibe, in the course of a wet day, these 750 barrels, cannot, of course, be ascertained, but the following calculations may be presented. The class of men I have described rarely have spare money, but if known to a landlord, they probably may obtain credit until the Saturday night. Now, putting their *extra* beer-drinking on wet days—for on fine days there is generally a pint or more consumed daily per working man—putting, I say, the *extra* potations at a pot (quart) each man, we find *one hundred and eight thousand* consumers (out of 2,000,000 people, or, discarding the women and children, not 1,000,000)! A number doubling, and trebling, and quadrupling the male adult population of many a splendid continental city.

Of the data I have given, I may repeat, no doubt can be entertained; nor, as it seems to me, can any doubt be entertained that the increased consumption is directly attributable to the casualty of labour*.

Of the Scurf Trade among the Rubbish-Carters.

Before proceeding to treat of the cheap or "scurf" labourers among the rubbish-carters, I shall do as I have done in connection with the casual labourers of the same trade, say a few words on that kind of labour in general, both as to the means by which it is usually obtained and as to the distinctive qualities of the scurf or low-priced labourers; for experience teaches me that the mode by which labour is cheapened is more or less similar in all trades, and it will therefore save much time and space if I here—as with the casual labourers—give the general facts in connection with this part of my subject.

In the first place, then, there are but two direct modes of cheapening labour, viz.:—

1. By making the workmen do *more* work for the *same* pay.
2. By making them do the *same* work for *less* pay.

The first of these modes is what is technically termed "*driving*," especially when effected by compulsory "overwork;" and it is called the "economy of labour" when brought about by more elaborate and refined processes, such as the division of labour, the large system of production, the invention

* The Great Exhibition, I am informed, produced a very small effect on the consumption of porter; and, according to the official returns, 160,000 gallons less spirits were consumed in the first nine months of the present year, than in the corresponding months of the last: thus showing that any occupation of mind or body is incompatible with intemperate habits, for drunkenness is essentially the vice of idleness, or want of something better to do.

of machinery, and the *temporary*, as contradistinguished from the *permanent*, mode of hiring.

Each of these modes of making workmen do *more* work for the *same* pay, can but have the same depressing effect on the labour market, for not only is the *rate* of remuneration (or ratio of the work to the pay) reduced when the operative is made to do a greater quantity of work for the same amount of money, but, unless the means of disposing of the extra products be proportionately increased, it is evident that just as many workmen must be displaced thereby as the increased term or rate of working exceeds the extension of the markets; that is to say, if 4000 workpeople be made to produce each twice as much as formerly (either by extending the hours of labour or increasing their rate of labouring), then if the markets or means of disposing of the extra products be increased only one-half, 1000 hands must, according to Cocker, be deprived of their ordinary employment; and these competing with those who are in work will immediately tend to reduce the wages of the trade generally, so that not only will the *rate* of wages be decreased, since each will have more work to do, but the actual earnings of the workmen will be diminished likewise.

Of the economy of labour itself, as a means of cheapening work, there is no necessity for me to speak here. It is, indeed, generally admitted, that to economize labour without proportionally extending the markets for the products of such labour, is to deprive a certain number of workmen of their ordinary means of living; and under the head of casual labour so many instances have been given of this principle that it would be wearisome to the reader were I to do other than allude to the matter at present. There are, however, several other means of causing a workman to do more than his ordinary quantity of work. These are :—

1. By extra supervision when the workmen are paid by the day. Of this mode of increased production an instance has already been cited in the account of the strapping-shops given at p. 304, vol. ii.
2. By increasing the workman's interest in his work; as in piece-work, where the payment of the operative is made proportional to the quantity of work done by him. Of this mode examples have already been given at p. 303, vol. ii.
3. By large quantities of work given out at one time; as in "lump-work" and "contract work."
4. By the domestic system of work, or giving out materials to be made up at the homes of the workpeople.
5. By the middleman system of labour.
6. By the prevalence of small masters.
7. By a reduced rate of pay, as forcing operatives to labour both longer and quicker, in order to make up the same amount of income.

Of several of these modes of work I have already spoken, citing facts as to their pernicious influence upon the greater portion of those trades where they are found to prevail. I have already shown how, by extra supervision—by increased interest in the work—as well as by decreased pay, operatives can be made to do more work than they otherwise would, and so be the cause, unless the market be proportionately extended, of depriving some of their fellow-labourers of their fair share of employment. It now only remains for me to set forth the effect of those modes of employment which have not yet been described, viz., the domestic system, the middleman system, and the contract and lump system, as well as the small-master system of work.

Let me begin with the first of the last-mentioned modes of cheapening labour, viz., *the domestic system of work*.

I find, by investigation, that in trades where the system of working on the master's premises has been departed from, and a man is allowed to take his work home, there is invariably a tendency to cheapen labour. These home workers, whenever opportunity offers, will use other men's ill-paid labour, or else employ the members of their family to enhance their own profits.

The domestic system, moreover, naturally induces *over-work and Sunday-work, as well as tends to change journeymen into trading operatives, living on the labour of their fellow-workmen.* When the work is executed off the master's premises, of course there are neither definite hours nor days for labour; and the consequence is, the generality of home workers labour early and late, Sundays as well as week-days, availing themselves at the same time of the co-operation of their wives and children; thus the trade becomes overstocked with workpeople by the introduction of a vast number of new hands into it, as well as by the overwork of the men themselves who thus obtain employment. When I was among the tailors, I received from a journeyman to whom I was referred by the Trades' Society as the one best able to explain the causes of the decline of that trade, the following lucid account of the evils of this system of labour :—

"The principal cause of the decline of our trade is the employment given to workmen at their own homes, or, in other words, to the 'sweaters.' The sweater is the greatest evil in the trade; as the sweating system increases the number of hands to an almost incredible extent—wives, sons, daughters, and extra women, all working 'long days'—that is, labouring from sixteen to eighteen hours per day, and Sundays as well. By this system two men obtain as much work as would give employment to three or four men working regular hours in the shop. Consequently, the sweater being enabled to get the work done by women and children at a lower price than the regular workman, obtains the greater part of the garments to be made, while men who depend upon the shop for their living are obliged to walk about idle. A greater quantity of work is done under the sweating system at a lower price. I consider that the decline of my trade dates from the change of day-work into piece-work. According to the old system, the

Original from HARVARD UNIVERSITY

journeyman was paid by the day, and consequently must have done his work under the eye of his employer. It is true that work was given out by the master before the change from day-work to piece-work was regularly acknowledged in the trade. But still it was morally impossible for work to be given out and not be paid by the piece. *Hence I date the decrease in the wages of the workman from the introduction of piece-work, and giving out garments to be made off the premises of the master.* The effect of this was, that the workman making the garment, knowing that the master could not tell whom he got to do his work for him, employed women and children to help him, and paid them little or nothing for their labour. This was the beginning of the sweating system. The workmen gradually became transformed from journeymen into 'middlemen,' living by the labour of others. Employers soon began to find that they could get garments made at a less sum than the regular price, and those tradesmen who were anxious to force their trade, by underselling their more honourable neighbours, readily availed themselves of this means of obtaining cheap labour."

The *middleman system of work* is so much akin to the domestic system, of which, indeed, it is but a necessary result, that it forms a natural addendum to the above. Of this indirect mode of employing workmen, I said, in the *Chronicle*, when treating of the timber-porters at the docks:—

"The middleman system is the one crying evil of the day. Whether he goes by the name of 'sweater,' 'chamber-master,' 'lumper,' or contractor, it is this *trading operative* who is the great means of reducing the wages of his fellow working-men. To make a profit out of the employment of his brother operatives he must, of course, obtain a lower class and, consequently, cheaper labour. Hence it becomes a *business* with him to hunt out the lowest grades of working men—that is to say, those who are either morally or intellectually inferior in the craft—the drunken, the dishonest, the idle, the vagabond, and the unskilful; these are the instruments that he seeks for, because, these being unable to obtain employment at the regular wages of the sober, honest, industrious, and skilful portion of the trade, he can obtain their labour at a lower rate than what is usually paid. Hence drunkards, tramps, men without character or station, apprentices, children—all suit him. Indeed, the more degraded the labourers, the better they answer his purpose, for the cheaper he can get their work, and consequently the more he can make out of it.

"'Boy labour or thief labour,' said a middleman, on a large scale, to me, 'what do I care, so long as I can get my work done cheap?' That this *seeking out* of cheap and inferior labour really takes place, and is a necessary consequence of the middleman system, we have merely to look into the condition of any trade where it is extensively pursued. I have shown, in my account of the tailors' trade printed in the *Chronicle*, that the wives of the sweaters not only parade the streets of London on the look-out for youths raw from the country, but that they make periodical trips to the poorest provinces of Ireland, in order to obtain workmen at the lowest possible rate. I have shown, moreover, that foreigners are annually imported from the Continent for the same purpose, and that among the chamber-masters in the shoe trade, the child-market at Bethnal-green, as well as the workhouses, are continually ransacked for the means of obtaining a cheaper kind of labour. All my investigations go to prove, that it is chiefly by means of this middleman system that the wages of the working men are reduced. It is this contractor — this trading operative — who is invariably the prime mover in the reduction of the wages of his fellow-workmen. He uses the most degraded of the class as a means of underselling the worthy and skilful labourers, and of ultimately dragging the better down to the abasement of the worst. He cares not whether the trade to which he belongs is already overstocked with hands, for, be those hands as many as they may, and the ordinary wages of his craft down to bare subsistence point, it matters not a jot to him; *he* can live solely by reducing them still lower, and so he immediately sets about drafting or importing a fresh and cheaper stock into the trade. If *men* cannot subsist on lower prices, then he takes apprentices, or hires children; if women of chastity cannot afford to labour at the price he gives, then he has recourse to prostitutes; or if workmen of character and worth refuse to work at less than the ordinary rate, then he seeks out the moral refuse of the trade—those whom none else will employ; or else he flies, to find labour meet for his purpose, to the workhouse and the gaol. Backed by this cheap and refuse labour, he offers his work at lower prices, and so keeps on reducing and reducing the wages of his brethren, until all sink in poverty, wretchedness, and vice. Go where we will, look into whatever poorly-paid craft we please, we shall find this *trading operative*, this *middleman* or contractor, at the bottom of the degradation."

The "contract system" or "lump work," as it is called, is but a corollary, as it were, of the foregoing; for it is an essential part of the middleman system, that the work should be obtained by the trading operative in large quantities, so that those upon whose labour he lives should be kept continually occupied, and the more, of course, that he can obtain work for, the greater his profit. When a quantity of work, usually paid for by the piece, is given out at one time, the natural tendency is for the piece-work to pass into lump-work; that is to say, if there be in a trade a number of distinct parts, each requiring, perhaps, from the division of labour, a distinct hand for the execution of it, or if each of these parts bear a different price, it is frequently the case that the master will contract with some one workman for the execution of the whole, agreeing to give a certain price for the job "in the lump," and allowing the workman to get whom he pleases to execute it. This is the case with the piece-working masters in the coach-building trade; but it is not essential to the contract or

Digitized by Google Original from HARVARD UNIVERSITY

lump system of work, that other hands should be employed; the main distinction between it and piece-work being that the work is given out in large quantities, and a certain allowance or reduction of price effected from that cause alone.

It is this contract or lump work which constitutes the great evil of the carpenter's, as well as of many other trades; and as in those crafts, so in this, we find that the lower the wages are reduced the greater becomes the number of trading operatives or middlemen. For it is when workmen find the difficulty of living by their labour increased that they take to scheming and trading upon the labour of their fellows. In the slop trade, where the pay is the worst, these creatures abound the most; and so in the carpenter's trade, where the wages are the lowest—as among the speculative builders—there the system of contracting and sub-contracting is found in full force.

Of this contract or lump work, I received the following account from the foreman to a large speculating builder, when I was inquiring into the condition of the London carpenters:—

"The way in which the work is done is mostly by letting and subletting. The masters usually prefer to let work, because it takes all the trouble off their hands. They know what they are to get for the job, and of course they let it as much under that figure as they possibly can, all of which is clear gain without the least trouble. How the work is done, or by whom, it's no matter to them, so long as they can make what they want out of the job, and have no bother about it. Some of our largest builders are taking to this plan, and a party who used to have one of the largest shops in London has within the last three years discharged all the men in his employ (he had 200 at least), and has now merely an office, and none but clerks and accountants in his pay. He has taken to letting his work out instead of doing it at home. The parties to whom the work is let by the speculating builders are generally working men, and these men in their turn look out for other working men, who will take the job cheaper than they will; and so I leave you, sir, and the public to judge what the party who really executes the work gets for his labour, and what is the quality of work that he is likely to put into it. The speculating builder generally employs an overlooker to see that the work is done sufficiently well to pass the surveyor. That's all he cares about. Whether it's done by thieves, or drunkards, or boys, it's no matter to him. The overlooker, of course, sees after the first party to whom the work is let, and this party in his turn looks after the several hands that he has sublet it to. The first man who agrees to the job takes it in the lump, and he again lets it to others in the piece. I have known instances of its having been let again a third time, but this is not usual. The party who takes the job in the lump from the speculator usually employs a foreman, whose duty it is to give out the materials and to make working drawings. The men to whom it is sublet only find labour, while the 'lumper,' or first contractor, agrees for both labour and materials. It is usual in contract work, for the first party who takes the job to be bound in a large sum for the due and faithful performance of his contract. He then, in his turn, finds out a sub-contractor, who is mostly a small builder, who will also bind himself that the work shall be properly executed, and there the binding ceases—those parties to whom the job is afterwards let, or sublet, employing foremen or overlookers to see that their contract is carried out. The first contractor has scarcely any trouble whatsoever; he merely engages a gentleman, who rides about in a gig, to see that what is done is likely to pass muster. The sub-contractor has a little more trouble; and so it goes on as it gets down and down. Of course I need not tell you that the first contractor, who does the *least* of all, gets the *most* of all; while the poor wretch of a working man, who positively executes the job, is obliged to slave away every hour, night after night, to get a bare living out of it; and this is the contract system."

A tradesman, or a speculator, will contract, for a certain sum, to complete the skeleton of a house, and render it fit for habitation. He will sublet the flooring to some working joiner, who will, in very many cases, take it on such terms as to allow himself, by working early and late, the regular journeymen's wages of 30*s.* a week, or perhaps rather more. Now this sub-contractor cannot complete the work within the requisite time by his own unaided industry, and he employs men to assist him, often subletting again, and such assistant men will earn perhaps but 4*s.* a day. It is the same with the doors, the staircases, the balustrades, the window-frames, the room-skirtings, the closets; in short, all parts of the building.

The subletting is accomplished without difficulty. Old men are sometimes employed in such work, and will be glad of any remuneration to escape the workhouse; while stronger workmen are usually sanguine that by extra exertion, "though the figure is low, they may make a tidy thing out of it after all." In this way labour is cheapened. "Lump" work, "piece" work, work by "the job," are all portions of the contract system. The principle is the same. "Here is this work to be done, what will you undertake to do it for?"

In number after number of the *Builder* will be found statements headed "Blind Builders." One firm, responding to an advertisement for "estimates" of the building of a church, sends in an offer to execute the work in the best style for 5000*l.* Another firm may offer to do it for somewhere about 3000*l.* The first-mentioned firm would do the work well, paying the "honourable" rate of wages. The under-working firm *must* resort to the scamping and subletting system I have alluded to. It appears that the building of churches and chapels, of all denominations, is one of the greatest encouragement to slop, or scamp, or under-paid work. The same system prevails in many trades with equally pernicious effects.

"If you will allow me," says a correspondent, "I would state that there is one cause of hardship

and suffering to the labouring or handicraftsman, which, to my mind, is far more productive of distress and poor-grinding than any other, or than all other causes put together: I allude to the *contract* system, and especially in reference to printing. Depend upon it, sir, the father of wickedness himself could not devise a more malevolent or dishonest course than that now very generally pursued by those who should be, of all others, the friends of the poor and working man. The Government and the great West-end clubs have reduced their transactions to such a low level in this respect that it seems to be the only question with them, Who will work lowest or supply goods at the lowest figure? And this, too, totally irrespective of the circumstance whether it may not reduce wages or bankrupt the contractor. No matter whether a party who has executed the work required for years be noted for paying a fair and remunerating price to his workmen or sub-tradesmen, and bears the character of a responsible and trustworthy man—all this is as nothing; for somebody, who may be, for aught that is cared, deficient in all these points, will do what is needful at *so much* less; and then, unless willing to reduce the wage of his workpeople, the long-employed tradesman has but the alternative of losing his business or cheating his creditors. And then, to give a smack to the whole affair, the 'Stationery Office' of the Government, or the committee of the club, will congratulate themselves and their auditors on the fact that a diminution in expenses has been effected; a result commemorated perhaps by an addition of salary to the officials in the former case, and of a 'cordial vote of thanks' in the latter. I do not write 'without book,' I can assure you, on these matters; for I have long and earnestly watched the subject, and could fill many a page with the details."

Of the ruinous effects of the contract system in connection with the army clothing, Mr. Pearse, the army clothier, gave the following evidence before the Select Committee on Army and Navy Appointments.

"When the contract for soldier's great coats was opened, Mr. Maberly took it at the same price (13*s.*) in December, 1808; this shows the effect of wild competition. In February following, Esdailes' house, who were accoutrement makers, and not clothiers, got knowledge of what was Mr. Maberly's price, and *they* tendered at 12*s.* 6½*d.* a month afterwards; it was evidently then a struggle for the price, and how the quality the least good (if we may use such a term) could pass. Mr. Maberly did not like to be outbidden by Esdailes; *Esdailes stopped subsequently*, and Mr. Maberly bid 12*s.* 6*d.* three months after, and Mr. Dixon bid again, and got the contract for 11*s.* 3*d.* in October, and in December of that year another public tender took place, and Messrs. A. and D. Cock took it at 11*s.* 5½*d.*, *and they subsequently broke.* It went on in this sort of way,—changing hands every two or every three months, by bidding against each other. Presently, though it was calculated that the great coat was to wear four years, it was found that *those great coats were so inferior in quality, that they wore only two years*, and representations were accordingly made to the Commander-in-Chief, when it was found necessary that great care should be taken to go back to the original good quality that had been established by the Duke of York."

Mr. Shaw, another army clothier, and a gentleman with whose friendship, I am proud to say, I have been honoured since the commencement of my inquiries—a gentleman actuated by the most kindly and Christian impulses, and of whom the workpeople speak in terms of the highest admiration and regard; this gentleman, impressed with a deep sense of the evils of the contract system to the under-paid and over-worked operatives of his trade, addressed a letter to the Chairman of the Committee on Army, Navy, and Ordnance Estimates, from which the following are extracts:—

"My Lord, my object more particularly is, to request your lordship will submit to the committee, *as an evidence of the evils of contracts*, the great coat sent herewith, made similar to those supplied to the army, and I would respectfully appeal to them as men, gentlemen, *as Christians*, whether *fivepence*, the price now being given to poor females for making up those coats, is a fair and just price for six, seven, and eight hours' work. . . . My Lord, *the misery amongst the workpeople is most distressing*—of a mass of people, *willing to work*, who cannot obtain it, and of a mass, especially women, most iniquitously paid for their labour, who are in a state of oppression disgraceful to the Legislature, the Government, the Church, and the consuming public. . . . . I would, therefore, most humbly and earnestly call upon your lordship, and the other members of the committee, to recommend an *immediate stop to be put to the system of contracting* now pursued by the different government departments, as being one of false economy, as a system most *oppressive to the poor*, and *being most injurious*, in every way, to the best *interests of the country*."

In another place the same excellent gentleman says:—

"I could refer to the screwing down of other things by the government authorities, but the above will be sufficient to show *how cruelly the workpeople employed in making up this clothing are oppressed; and some of the men will tell you they are tired of life. Last week I found one man making a country police coat, who said his wife and child were out begging.*"

The last mentioned of the several modes of cheapening labour is the "*small-master system*" of work, that is to say, the operatives taking to make up materials on their own account rather than for capitalist employers. In every trade where there are *small* masters, trades into which it requires but little capital to embark, there is certain to be a cheapening of labour. Such a man works himself, and to get work, to meet the exigences of the rent and the demands of the collectors of the parliamentary and parochial taxes, he will often underwork the very journeymen whom he occasionally employs, doing "the job" in such

Original from HARVARD UNIVERSITY

cases with the assistance of his family and apprentices, at a less rate of profit than the amount of journeymen's wages.

Concerning these garret masters I said, when treating of the Cabinet trade, in the *Chronicle*, "The cause of the extraordinary decline of wages in the Cabinet trade (even though the hands decreased and the work increased to an unprecedented extent) will be found to consist in the increase that has taken place within the last 20 years of what are called 'garret masters' in the cabinet trade. These garret masters are a class of small 'trade-working masters,' the same as the 'chamber masters' in the shoe trade, supplying both capital and labour. They are in manufacture what 'the peasant proprietors' are in agriculture—their own employers and their own workmen. There is, however, this one marked distinction between the two classes—the garret master cannot, like the peasant proprietor, *eat* what he produces; the consequence is, that he is obliged to convert each article into food immediately he manufactures it—no matter what the state of the market may be. The capital of the garret master being generally sufficient to find him in materials for the manufacture of only one article at a time, and his savings being but barely enough for his subsistence while he is engaged in putting those materials together, he is compelled, the moment the work is completed, to part with it for whatever he can get. He cannot afford to keep it even a day, for to do so is generally to remain a day unfed. Hence, if the market be at all slack, he has to force a sale by offering his goods at the lowest possible price. What wonder, then, that the necessities of such a class of individuals should have created a special race of employers, known by the significant name of 'slaughter-house men'—or that these, being aware of the inability of the 'garret masters' to hold out against any offer, no matter how slight a remuneration it affords for their labour, should continually lower and lower their prices, until the entire body of the competitive portion of the cabinet trade is sunk in utter destitution and misery? Moreover, it is well known how strong is the stimulus among peasant proprietors, or, indeed, any class working for themselves, to extra production. So it is, indeed, with the garret masters; their industry is almost incessant, and hence a greater quantity of work is turned out by them, and continually forced into the market, than there would otherwise be. What though there be a brisk and a slack season in the cabinet-maker's trade as in the majority of others?—slack or brisk, the garret masters must produce the same excessive quantity of goods. In the hope of extricating himself from his overwhelming poverty, he toils on, producing more and more—and yet the more he produces the more hopeless does his position become; for the greater the stock that he thrusts into the market, the lower does the price of his labour fall, until at last, he and his whole family work for less than half what he himself could earn a few years back by his own unaided labour."

The small-master system of work leads, like the domestic system, with which, indeed, it is intimately connected, to the employment of wives, children, and apprentices, as a means of assistance and extra production—for as the prices decline so do the small masters strive by further labour to compensate for their loss of income.

Such, then, are the several modes of work by which labour is cheapened. There are, as we have seen, but two ways of *directly* effecting this, viz., first by making men do more work for the same pay, and secondly, by making them do the same work for less pay. The way in which men are made to do more, it has been pointed out, is, by causing them either to work longer or quicker, or else by employing fewer hands in proportion to the work; or engaging them only for such time as their services are required, and discharging them immediately afterwards. These constitute the several modes of economizing labour, which lowers the rate of remuneration (the ratio of the pay to the work) rather than the pay itself. The several means by which this result is attained are termed "systems of work, production, or engagement," and such are those above detailed.

Now it is a necessity of these several systems, though the actual amount of remuneration is not directly reduced by them, that a cheaper labour should be obtained for carrying them out. Thus, in contract or lump work, perhaps, the price may not be immediately lowered; the saving to the employer consisting chiefly in supervision, he having in such a case only one man to look to instead of perhaps a hundred. The contractor, or lumper, however, is differently situated; he, in order to reap any benefit from the contract, must, since he cannot do the whole work himself, employ others to help him, and to reap any benefit from the contract, this of course must be done at a lower price than he himself receives; so it is with the middleman system, where a profit is derived from the labour of other operatives; so, again, with the domestic system of work, where the several members of the family, or cheaper labourers, are generally employed as assistants; and even so is it with the small-master system, where the labour of apprentices and wives and children is the principal means of help. Hence the operatives adopting these several systems of work are rather the instruments by which cheap labour is obtained than the cheap labourers themselves. It is true that a sweater, a chamber master, or garret master, a lumper or contractor, or a home worker, generally works cheaper than the ordinary operatives, but this he does chiefly by the cheap labourers he employs, and then, finding that he is able to underwork the rest of the trade, and that the more hands he employs the greater becomes his profit, he offers to do work at less than the usual rate. It is not a necessity of the system that the middleman operative, the domestic worker, the lumper, or garret master should be himself underpaid, but simply that he should employ others who are so, and it is thus that such systems of work tend to cheapen the labour of those trades in which they are found to prevail. Who, then, are the cheap labourers?—who the individuals, by means of

whose services the sweater, the smaller master, the lumper, and others, is enabled to underwork the rest of his trade?—what the general characteristics of those who, in the majority of handicrafts, are found ready to do the same work for less pay, and how are these usually distinguished from such as obtain the higher rate of remuneration?

The cheap workmen in all trades, I find, are divisible into three classes:—

1. The unskilful.
2. The untrustworthy.
3. The inexpensive.

First, as regards the *unskilful*. Long ago it has been noticed how frequently boys were put to trades to which their tastes and temperaments were antagonistic. Gay, who in his quiet, unpretending style often elicited a truth, tells how a century and a half ago the generality of parents never considered for what business a boy was best adapted—

> "But ev'n in infancy decree
> What this or t'other son shall be."

A boy thus brought up to a craft for which he entertains a dislike can hardly become a proficient in it. At the present time thousands of parents are glad to have their sons reared to *any* business which their means or opportunities place within their reach, even though the lad be altogether unsuited to the craft. The consequence is, that these boys often grow up to be unskilful workmen. There are technical terms for them in different trades, but perhaps the generic appellation is "muffs." Such workmen, however well conducted, can rarely obtain employment in a good shop at good wages, and are compelled, therefore, to accept second, third, and fourth-rate wages, and are often driven to slop work.

Other causes may be cited as tending to form unskilful workmen: the neglect of masters or foremen, or their incapacity to teach apprentices; irregular habits in the learner; and insufficient practice during a master's paucity of employment. I am assured, moreover, that hundreds of mechanics yearly come to London *from the country parts*, whose skill is altogether inadequate to the demands of the "honourable trade." Of course, during the finishing of their education they can only work for inferior shops at inferior wages; hence another cause of cheap labour. Of this I will cite an instance: a bootmaker, who for years had worked for first-rate West-end shops, told me that when he came to London from a country town he was sanguine of success, because he knew that he was a *ready* man (a quick workman.) He very soon found out, however, he said, that as he aspired to do the best work, he "had his business to learn all over again;" and until he attained the requisite skill, he worked for "just what he could get:" he was a cheap, because then an unskilful, labourer.

There is, moreover, the cheaper labour of *apprentices*, the great prop of many a slop-trader; for as such traders disregard all the niceties of work, as they disregard also the solidity and perfect finish of any work (finishing it, as it was once described to me, "just to the eye"), a lad is soon made useful, and his labour remunerative to his master, as far as slop remuneration goes, which, though small in a small business, is wealth in a "monster business."

There are, again, the "*improvers*." These are the most frequent in the dress-making and millinery business, as young women find it impossible to form a good connection among a wealthier class of ladies in any country town, unless the "patronesses" are satisfied that their skill and taste have been perfected in London. In my inquiry (in the course of two letters in the *Morning Chronicle*) into the condition of the workwomen in this calling, I was told by a retired dressmaker, who had for upwards of twenty years carried on business in the neighbourhood of Grosvenor-square, that she had sometimes met with "improvers" so tasteful and quick, from a good provincial tuition, that they had really little or nothing to learn in London. And yet their services were secured for one, and oftener for two years, merely for board and lodging, while others employed in the same establishment had not only board and lodging, but handsome salaries. The improver's, then, is generally a cheap labour, and often a very cheap labour too. The same form of cheap labour prevails in the carpenter's trade.

There is, moreover, the labour of *old men*. A tailor, for instance, who may have executed the most skilled work of his craft, in his old age, or before the period of old age, finds his eyesight fail him,—finds his tremulous fingers have not a full and rapid mastery of the needle, and he then labours, at greatly reduced rates of payment, on the making of soldiers' clothing—"sanc-work," * as it is called—or on any ill-paid and therefore ill-wrought labour.

The inferior, as regards the quality of the work, and under-paid class of *women*, in tailoring, for example, again, cheapen labour. It is cheapened, also, by the employment of *Irishmen* (in, perhaps, all branches of skilled or unskilled labour), and of *foreigners*, more especially of Poles, who are inferior workmen to the English, and who will work *very* cheap, thus supplying a low-price labour to those who seek it.

I may remark further, that if a first-rate workman be driven to slop work, he soon loses his skill; he can only work slop; this has been shown over and over again, and so *his* labour becomes cheap in the mart.

2. Of *Untrustworthy Labour* (as a cause of cheap labour) I need not say much. It is obvious that a drunken, idle, or dishonest workman or workwoman, when pressed by want, will and must labour, not for the recompense the labour merits, but for whatever pittance an employer will accord. There is no reliance to be placed in him. Such a man cannot "hold out" for terms, for he is perhaps starving, and it is known that "he cannot be depended upon." In the sweep's trade many of those who work at a lower rate than the rest of

* The term *sanc* in "sanc-work" is the Norman word for blood (Latin, *sanguis*; French, *sang*), so that "sanc-work" means, literally, bloody work, this called either from the sanguinary trade of the soldier, or from the blood-red colour of the cloth.

the trade are men who have lost their regular work by dishonesty.

3. The *Inexpensive class* of workpeople are very numerous. They consist of three sub-divisions:—

(*a*.) Those who have been accustomed to a coarser kind of diet, and who, consequently, requiring less, can afford to work for less.

(*b*.) Those who derive their subsistence from other sources, and who, consequently, do not live by their labour.

(*c*.) Those who are in receipt of certain "aids to their wages," or who have other means of living beside their work.

Of course these causes can alone have influence where the wages are *minimized* or reduced to the lowest ebb of subsistence, in which case they become so many means of driving down the price of labour still lower.

a. Those who, being what is designated hard-reared that is to say, accustomed to a scantier or coarser diet, and who, therefore, "can do" with a less quantity or less expensive quality of food than the average run of labourers, can of course live at a lower cost, and so *afford* to work at a lower rate. Among such (unskilled) labourers are the peasants from many of the counties, who seek to amend their condition by obtaining employment in the towns. I will instance the agricultural labourers of Dorsetshire.

"Bread and potatoes," writes Mr. Thornton, in his work on Over-Population and its Remedy, p. 21, "do really form the staple of their food. As for meat, most of them would not know its taste, if, once or twice *in the course of their lives*, —on the squire's having a son and heir born to him, or on the young gentleman's coming of age,— they were not regaled with a dinner of what the newspapers call 'old English fare.' Some of them contrive to have a little bacon, in the proportion, it seems, of *half a pound a week to a dozen persons*, but they more commonly use fat to give the potatoes a relish; and, as one of them said to Mr. Austin (a commissioner), they don't *always* go without cheese.'"

With many poor Irishmen the rearing has been still harder. I had some conversation with an Irish rubbish-carter, who had been thrown out of work (and was entitled to no allowance from any trade society) in consequence of a strike by Mr. Myers's men. On my asking him how he subsisted in Ireland, "Will, thin, sir," he said, "and it's God's truth, I once lived for days on green things I picked up by the road side, and the turnips, and that sort of mate I stole from the fields. It was called staling, but it was the hunger, 'deed was it. That was in the county Limerick, sir, in the famine and 'viction times; and, glory be to God, I 'scaped when others didn't."

I may observe that the chief local paper, the *Limerick and Clare Examiner*, published twice a week, gave, twice a week, at the period of "the famine and evictions," statements similar to that of my informant.

Now, would not a poor man, reared as the Limerick peasant I have spoken of, who was actually driven to eat the grass, which biblical history shows was once a signal punishment to a great offender—would not such a man work for the veriest dole, rather than again be subjected to the pangs of hunger? In my inquiries among the costermongers, one of them said of the Irish in his trade, and without any bitterness, "they'll work for nothing, and live on less." The meaning is obvious enough, although the assertion is, of course, a contradiction in itself.

"This department of labour," says Mr. Baines, in his History of the Hand-Loom Weavers, is "greatly overstocked, and the price necessarily falls. The evil is aggravated by the multitudes of Irish who have flocked into Lancashire, some of whom, having been linen weavers, naturally resort to the loom, and others learn to weave as the easiest employment they can adopt. Accustomed to a wretched mode of living in their own country, they are contented with wages that would starve an English labourer. They have, in fact, so lowered the *rate* of wages as to drive many of the English out of the employment, and to drag down those who remain in it to their own level."

b. Those who derive their subsistence from other sources can, of course, afford to work cheaper than those who have to live by their labour. To this class belongs the labour of wives and children, who, being supposed to be maintained by the toil of the husband, are never paid "living wages" for what they do; and hence the misery of the great mass of needlewomen, widows, unmarried and friendless females, and the like, who, having none to assist them, are forced to starve upon the pittance they receive for their work. The labour of those who are in prisons, workhouses, and asylums, and who consequently have their subsistence found them in such places, as well as the work of prostitutes, who obtain their living by other means than work, all come under the category of those who can afford to labour at a lower rate than such as are condemned to toil for an honest living. It is the same with apprentices and "improvers," for whose labour the instruction received is generally considered to be either a sufficient or partial recompense, and who consequently look to other means for their support. Under the same head, too, may be cited the labour of amateurs, that is to say, of persons who either are not, or who are too proud to acknowledge themselves, regular members of the trade at which they work. Such is the case with very many of the daughters of tradesmen, and of many who are considered *genteel* people. These young women, residing with their parents, and often in comfortable homes, at no cost to themselves, will, and do, undersell the regular needlewomen; the one works merely for pocket-money (often to possess herself of some article of finery), while the other works for what is called "the bare life."

c. The last-mentioned class, or those who are in possession of what may be called "aids to wages," are differently circumstanced. Such are the men who have other employment besides

that for which they accept less than the ordinary pay, as is the case with those who attend at gentlemen's houses for one or two hours every morning, cleaning boots, brushing clothes, &c., and who, having the remainder of the day at their own disposal, can afford to work at any calling cheaper than others, because not solely dependent upon it for their living.

The army and navy pensioners (non-commissioned officers and privates) were, at one period, on the disbanding of the militia and other forces, a very numerous body, but it was chiefly the military pensioners whose position had an effect upon the labour of the country. The naval pensioners found employment as fishermen, or in some avocation connected with the sea. The military pensioners, however, were men who, after a career of soldiership, were not generally disposed to settle down into the drudgery of regular work, even if it were in their power to do so; and so, as they always had their pensions to depend upon, they were a sort of universal jobbers, and jobbed cheaply. At the present time, however, this means of cheap labour is greatly restricted, compared with what was the case, the number of the pensioners being considerably diminished. Many of the army pensioners turn the wheels for turners at present.

The allotment of gardens, which yield a partial support to the allottee, are another means of cheap labour. The allotment demands a certain portion of time, but is by no means a thorough employment, but merely an "aid," and consequently a *means*, to low wages. Such a man has the advantage of obtaining his potatoes and vegetables at the cheapest rate, and so can afford to work cheaper than other men of his class. It was the same formerly with those who received "relief" under the old Poor-Law.

And even under the present system it has been found that the same practice is attended with the same result. In the Sixth Annual Report of the Poor-Law Commissioners, 1840, at p. 31, there are the following remarks on the subject:—

"Whilst upon the subject of relief to widows in aid of wages, we must not omit to bring under your Lordship's notice an illustration of the *depressing effect* which is produced by the practice of giving relief in aid of wages to widows upon the earnings of females. Colonel A'Court states:—

"'As regards females, the instance to which I have alluded presents itself in the Portsea Island Union, where, from the insufficiency of workhouse accommodation, as well as from benevolent feelings, small allowances of 1*s.* 6*d.* or 2*s.* a week are given to widows with or without small children, or to married women deserted by their husbands. *Having this certain income, however small, they are enabled to work at lower wages than those who do not possess this advantage.* The consequence is, that competition has enabled the shirt and stay manufacturers, who abound in the Union, and who furnish in great measure the London as well as many foreign markets with these articles of their trade, to get their work done at the extraordinary low prices of—stays, complete, 9*d.*; shirts, from 1*s.* to 1*s.* 6*d.* per dozen.

"'The women all declare that they cannot possibly, after working from twelve to fifteen hours per day, earn more than 1*s.* 6*d.* per week. The manufacturers assert that, by steady work, 4*s.* to 6*s.* a week may be earned under ordinary circumstances.

"'In the meantime *the demand for workwomen increases*, and it is by no means unusual to see hand-bills posted over the town requiring from 500 to 1000 additional stitchers.'"

Such, then, is the character of the cheap workers in all trades: go where we will, we shall find the low-priced labour of the trade to consist of either one or other of the three classes above-mentioned; while the *means* by which this labour is brought into operation will be generally by one of the "systems of work" before specified.

The cheap labour of the rubbish-carters' trade appears to be a consequence of two distinct antecedents, viz., casual labour and the prevalence of the contract system among builder's work. The small-master system also appears to have some influence upon it.

First as regards the influence of casual labour in reducing the ordinary rate of wages.

The tables given at p. 290, vol. ii., showing the wages paid to the rubbish-carters, present what appears, and indeed is, a strange discrepancy of payment to the labourers in rubbish-carting. About three-fourths of the rubbish-carters throughout London receive 18*s.* weekly, when in work; in Hampstead, however, the rate of their wages is (uniformly) 20*s.* a week; in Lambeth (but less uniformly), it is 19*s.*; in Wandsworth, 17*s.*; in Islington, 16*s.*; and in Greenwich, 14*s.* and 12*s.* The character of the work, whether executed for 12*s.* or 20*s.* weekly, is the same; why, then, can a rubbish-carter, who works at Hampstead, earn 8*s.* a week more than one who works at Greenwich? An employer of rubbish-carters, and of similar labourers, on a large scale, a gentleman thoroughly conversant with the subject in all its industrial bearings, accounts for the discrepancy in this manner:—

After the corn and the hop-harvests have terminated, there is always an influx of unskilled labourers into Gravesend, Woolwich, and Greenwich. These are the men who, from the natural bent of their dispositions, or from the necessity of their circumstances, resort to the casual labour afforded by the revolution of the seasons, when to gather the crops before the weather may render the harvest precarious and its produce unsound, is a matter of paramount necessity, and the increase of hands employed during this season is, as a consequence, proportionately great. The chief scene of such labour in the neighbourhood of the metropolis, is in the county of Kent; and on the cessation of this work, of course there is a large amount of labour "turned adrift," to seek, the next few days, for any casual employment that may "turn up." In this way, I am assured,

HARVARD UNIVERSITY

a large amount of cheap and unskilled labour is being constantly placed at the command of those masters who, so to speak, occupy the line of march to London, and are, therefore, first applied to for employment by casual labourers; who, when engaged, are employed as inferior, or unskilful, workmen, at an inferior rate of remuneration. Greenwich may be looked upon as the first stage or halt for casual labourers, on their way to London.

My informant assured me, as the result of his own observations, that an English labourer would, as a general rule, execute more work by one-sixth, in a week, than an Irish labourer (a large proportion of the casual hands are Irish); that is, the extent of work which would occupy the Irishman six, would occupy the Englishman but five days, were it so calculated. The Englishman was, however, usually more skilled and persevering, and far more to be depended upon. So different was the amount of work, even in rubbish-carting, between an able and experienced hand and one unused to the toil, or one inadequate from want of alertness or bodily strength, or any other cause, to its full and quick execution, that two "good" men in a week have done as much work as three indifferent hands. Thus two men at 18*s.* weekly each are as cheap (only employers cannot always see it), when they are thorough masters of their business, as three unready hands at 12*s.* a week each. The misfortune, however, is, that the 12*s.* a week men have a tendency to reduce the 16*s.* to their level.

With regard to the difference between the wages of Hampstead and Greenwich, I am informed that stationary working rubbish-carters are not too numerous in Hampstead, which is considered as rather "out of the way;" and as that metropolitan suburb is surrounded in every direction by pasture-land and wood-land, it is not in the line of resort of the class of men who seek the casual labour in harvesting, &c., of which I have spoken; it is rarely visited by them, and consequently, the regular hands are less interfered with than elsewhere, and wages have not been deteriorated.

The mode of work among the scurf labourers differs somewhat from that of the honourable part of the trade; the work executed by the scurf masters being for the most part on a more limited scale than that of the others. To meet the demands of builders or of employers generally, when "time" is an object, demands the use of relays of men, and of strong horses. This demand the smaller or scurf master cannot always meet. He may find men, but not always horses and carts, and he will often enough undertake work beyond his means and endeavour to aggrandise his profits by screwing his labourers. The *hours of scurf-employed labour* are nominally the same as the regular trade, but as an Irish carter said, "it's ralely the hours the masther plases, and they're often as long as it's light." The *scurf labourer is often paid by the day*, with "a day's hire, and no notice beyond." I am informed that scurf labourers generally work an hour a day, without extra remuneration, longer than those in the honourable trade.

The rubbish-carters employed by the scurf masters are not, as a body, I am assured, so badly paid as they were a few years back. It is rarely that labouring men can advance any feasible reason for the changes in their trade.

One of the main causes of the deteriorated wages of the rubbish-carters is the system of contracting and subletting. This, however, is but a branch of the ramified system of subletting in the construction of the "scamped" houses of the speculative builders. The building of such houses is sublet, literally from cellar to chimney. The rubbish-carting may be contracted for at a certain sum. The contractor may sublet it to men who will do it for one-fourth less perhaps, and who may sublet the labour in their turn. For instance, the calculation may be founded on the working men's receiving 15*s.* weekly. A contractor, a man possessing a horse, perhaps, and a couple of carts, and hiring another horse, will undertake it on the knowledge of his being able to engage men at 12*s.* or 13*s.* weekly, and so obtain a profit; indeed the reduction of price in such cases must all come out of the labour.

This subletting, I say, is but a small part of a gigantic system, and it is an unquestionable cause of the grinding down of the rubbish-carters' wages, and that by a class who have generally been working men themselves, and risen to be the owners of one or two carts and horses.

From one of these men, now a working carter, I had the following account, which further illustrates the mode of labour as well as of employment.

"I got a little a-head," he stated, "from railway jobbing and such like, and my father-in-law, as soon as I got married, made me a present of 20*l.* unexpected. I started for myself, thinking to get on by degrees, and get a fresh horse and cart every year. But it couldn't be done, sir. If I offered to take a contract to cart the rubbish and dig it, a builder would say,—'I can't wait; you haven't carts and horses enough from your own account, and I can't wait. If you have to hire them I can do that myself.' I was too honest, sir, in telling the plain truth, or I might have got more jobs. It's not a good trade in a small way, for if your horses aren't at work, they're eating their heads off, and you're fretting your heart out. Then I got to do sub-contracting, as you call it. No, it weren't that, it was under-working. I'd go to Mr. V—— as I knew, and say, 'You're on such a place, sir, have you room for me?' 'I think not,' he'd say, 'I've only the regular thing and no advantages—10*s.* 6*d.* for a day's work, horse and cart, or 4*s.* a load.' Those are the regular terms. Then I'd say, 'Well, sir, I'll do it for 8*s.* 6*d.*, and be my own carman;' and so perhaps I'd get the job, and masters often say: 'I know I shall lose at 10*s.* 6*d.*, but if I don't, you shall have something over.' Get anything over! Of course not, sir. I could have lived if I had constant work for two horses and carts, for I would have got a cheap man; such as me must get cheap men to drive the

second cart, and under my own eye, whenever I could; but one of my poor horses broke his leg, and had to be sent to the knacker's, and I sold the other and my carts, and have worked ever since as a labouring man; mainly at pipe-work. O, yes, and rubbish-carting. I get 18*s.* a week now, but not regular.

"Well, sir, I'm sure I can't say, and I think no man could say, how much there's doing in sub-contracting. If I'm at work in Cannon-street, I don't know what's doing at Notting-hill, or beyond Bow and Stratford. No, I'm satisfied there's not so much of it as there was, but it's done so on the sly; who knows how much is done still, or how little? It's a system as may be carried on a long time, and is carried on, as far as men's labour goes, but it's different where there's horses, and stable rent. They can't be screwed, or under-fed, beyond a certain pitch, or they couldn't work at all, and so there's not as much under-work about horse-labour."

These small men are among the scurf and petty rubbish-carters, and are often the means of depressing the class to which they have belonged.

The employment in the honourable trade at rubbish-carting would be one of the best among unskilled labourers, were it continuous. But it is not continuous, and three-fourths of those engaged in it have only six months' work at it in the year. In the scurf-masters' employ, the work is really "casual," or, as I heard it quite as often described, "chance." In both departments of this trade, the men out of work look for a job in scavagery, and very generally in night-work, or, indeed, in any labour that offers. The Irish rubbish-carters will readily became hawkers of apples, oranges, walnuts, and even nuts, when out of employ, so working in concert with their wives. I heard of only four instances of a similar resource by the English rubbish-carters.

What I have said of the education, religion, politics, concubinage, &c., &c., of the better-paid rubbish-carters would have but to be repeated, if I described those of the under-paid. The latter may be more reckless when they have the means of enjoyment, but their diet, amusements, and expenditure would be the same, were their means commensurate. As it is, they sometimes live very barely and have hardly any amusements at their command. Their dinners, when single men, are often bread and a saveloy; when married, sometimes tea and bread and butter, and occasionally some "block ornaments;" the Irish being the principal consumers of cheap fish.

The labour of the wives of the rubbish-carters is far more frequently that of char-women than of needle-women, for the great majority of these women before their marriage were servant-maids. All the information I received was concurrent in that respect. The wife of a carman who keeps a chandler's shop near the Edgeware-road, greatly resorted to by the class to which her husband belonged, told me that out of somewhere about 25 wives of rubbish-carters or similar workmen, whom she knew, 20 had been domestic servants; what the others had been she did not know.

"I can tell you, sir," said the woman, "charing is far better than needle-work; far. If a young woman has conducted herself well in service, she can get charing, and then if she conducts herself well again, she makes good friends. That's, of course, if they're honest, sir. I know it from experience. My husband—before we were able to open this shop—was in the hospital a long time, and I went out charing, and did far better than a sister I have, who is a capital shirt-maker. There's broken victuals, sometimes, for your children. It's a hard world, sir, but there's a many good people in it."

One woman (before mentioned) earned not less than 5*s.* weekly in superior shirt-making, as it was described to me, which was evidently looked upon as a handsome remuneration for such toil. Another earned 3*s.* 6*d.*; another 2*s.* 6*d.*; and others, with uncertain employ, 2*s.*, 1*s.* 6*d.*, and in some weeks nothing. Needle-work, however, is, I am informed, not the work of one-tenth of the rubbish-carters' wives, whatever the earnings of the husband. From all I could learn, too, the wives of the under-paid rubbish-carters earned more, by from 10 to 20 per cent., than those of the better-paid. The earnings of a charwoman in average employ, as regards the wives of the rubbish-carters, is about 4*s.* weekly, without the exhausting toil of the needle-woman, and with the advantage of sometimes receiving broken meat, dripping, fat, &c., &c. The wives of the Irish labourers in this trade are often all the year street-sellers, some of wash-leathers, some of cabbage-nets, and some of fruit, clearing perhaps from 6*d.* to 9*d.* a day, if used to street-trading, as the majority of them are.

The under-paid labourers in this trade are chiefly poor Irishmen. The Irish workmen in this branch of the trade have generally been brought up "on the land," as they call it, in their own country, and after the sufferings of many of them during the famine, 12*s.* a week is regarded as "a rise in the world."

From one of this class I learned the following particulars. He seemed a man of 26 or 28:—

"I was brought up on the land, sir," he said, "not far from Cullin, in the county Wexford. I lived with my father and mother, and shure we were badly off. Shure, thin, we were. Father and mother—the Heavens be their bed—died one soon after another, and some friends raised me the manes to come to this country. Well, thin, indeed, sir, and I can't say how they raised them, God reward them. I got to Liverpool, and walked to London, where I had some relations. I sold oranges in the strates the first day I was in London. God help me, I was glad to do anything to get a male's mate. I've lived on 6*d.* a-day sometimes. I have indeed. There was 2*d.* for the lodging, and 4*d.* for the mate, the tay and bread and butter. Did I live harder than that in Ireland, your honour? Well, thin, I have. I've lived on a dish of potatoes that might cost a penny there, where things is bhutiful and chape. Not like this country. No, no. I wouldn't care to go back. I have no friends there now. Thin I got

ingaged by a man—yis, he was a rubbish-carter—to help him to fill his cart, and then we shot it on some new garden grounds, and had to shovel it about to make the grounds livil, afore the top soil was put on, for the bhutiful flowers and the gravel walks. Tim—yis, he was a counthryman of mine, but a Cor-rk man—said he 'd made a bad bargain, for he was bad off, and he only clared 4*d.* a load, and he 'd divide it wid me. We did six loads in a day, and I got 1*s.* every night for a wake. This was a rise. But one Sunday evening I was standing talking with people as lived in the same coort, and I tould how I was helping Tim. And two Englishmen came to find four men as they wanted for work, and ould Ragin (Regan) tould them what I was working for. And one of 'em said, I was 'a b —— Irish fool,' and ould Ragin said so, and words came on, and thin there was a fight, and the pelleece came, and thin the fight was harder. I was taken to the station, and had a month. I had two black eyes next morning, but was willin' to forget and forgive. No, I 'm not fond of fightin'. I 'm a paceable mun, glory be to God, and I think I was put on. Oh, yis, and indeed thin, your honour, it was a fair fight."

I inquired of an English rubbish-carter as to these fair fights. He knew nothing of the one in question, but had seen such fights. They were usually among the Irish themselves, but sometimes Englishmen were "drawn into them." "Fair fights! sir," he said, "why the Irishes don't stand up to you like men. They don't fight like Christians, sir; not a bit of it. They kick, and scratch, and bite, and tear, like devils, or cats, or women. They 're soon settled if you can get an honest knock at them, but it isn't easy."

"I sarved my month," continued my Irish informant, "and it ain't a bad place at all, the prison. I tould the gintleman that had charge of us, that I was a Roman Catholic, God be praised, and couldn't go to his prayers. 'O very well, Pat,' says he. And next day the praste came, and we were shown in to him, and very angry he was, and said our conduc' was a disgrace to religion, and to our counthry, and to him. Do I think he was right, sir? God knows he was, or he wouldn't have said so.

"I hadn't been out of prison two hours before I was hired for a job, at 10*s.* a week. It was in the city, and I carried old bricks and rubbish along planks, from the inside of a place as was pulled down; but the outside, all but the roof, was standin' until the windor frames, and the door posts, and what other timbers there was, was sould. It was dreadful hard work, carrying the basket of rubbish on your back to the cart. The dust came through, and stuck to my neck, for I was wet all over wid sweatin' so. Every man was allowed a pint of beer a day, and I thought nivver anything was so sweet. I don't know who gave it. The masther, I suppose. Will, thin, sir, I don't know who was the masther; it was John Riley as ingaged me, but *he's* no masther. Yis, thin, and I 've been workin' that way ivver since. I 've sometimes had 14*s.* a week, and sometimes 10*s.*, and sometimes 12*s.* A man like me must take what he can get, and I will take it. I 've been out of work sometimes, but not so much as some, for I 'm young and strong. No, I can't save no money, and I have nothing just now to save it for. When I 'm out of work, I sell fruit in the streets."

This statement, then, as regards the Irish labourers, shows the quality of the class employed. The English labourers, working on the same terms, are of the usual class of men so working,—broken-down men, unable, or accounting themselves unable, to "do better," and so accepting any offer affording the means of their daily bread.

OF THE LONDON CHIMNEY-SWEEPERS.

CHIMNEY-SWEEPERS are a consequence of two things—chimneys and the use of coals as fuel; and these are both commodities of comparatively recent introduction.

It is generally admitted that the earliest mention of *chimneys* is in an Italian MS., preserved in Venice, in which it is recorded that chimneys were thrown down in that city from the shock of an earthquake in 1347. In England, down even to the commencement of the reign of Elizabeth, the greater part of the houses in our towns had no chimneys; the fire was kindled on a hearth-stone on the floor, or on a raised grate against the wall or in the centre of the apartment, and the smoke found its way out of the doors, windows, or casements.

During the long, and—as regards civil strife—generally peaceful, reign of Elizabeth, the use of chimneys increased. In a Discourse prefixed to an edition of Holinshed's "Chronicles," in 1577, Harrison, the writer, complains, among other things, "marvellously altered for the worse in England," of the multitude of chimneys erected of late. "Now we have many chimneys," he says, "and our tenderlings complain of rheums, catarrhs, and poses. Then we had none but *reredoses*, and our heads did never ache."* He demurs, too, to the change in the material of which the houses were constructed: "Houses were once builded of willow, then we had oaken men; but now houses are made of oak, and our men not only become willow, but a great many altogether of straw, which is a sore alteration."

* "Reredos, dossel (*retable*, Fr.; *postergale*, Ital.)," according to Parker's Glossary of Architecture, was "the wall or screen at the back of an altar, seat, &c.; it was usually ornamented with panelling, &c., especially behind an altar, and sometimes was enriched with a profusion of niches, buttresses, pinnacles, statues, and other decorations, which were often painted with brilliant colours.

"The open fire-hearth, frequently used in ancient domestic halls, was likewise called a reredos.

"In the description of Britain prefixed to Holinshed's 'Chronicles,' we are told that formerly, before chimneys were common in mean houses, 'each man made his fire against a reredosse in the hall, where he dined and dressed his meat.'"

The original word would appear to be *dosel* or *reredosel;* for Kelham, in his "Norman Dictionary," explains the word *doser* or *dosel* to signify a hanging or canopy of silk, silver, or gold work, under which kings or great personages sit; also the back of a chair of state (the word being probably a derivative of the Latin *dorsum*, the back. *Dss*, in slang, means a *bed*, a "dossing crib" being a sleeping-place, and has clearly the same origin). A *rere-dos* or *rere-dosel* would thus appear to have been a

In Shakespeare's time, the chimney-sweepers seem to have become a recognised class of public cleansers, for in "Cymbeline" the poet says—

> "Fear no more the heat o' the sun,
> Nor the furious winter's rages;
> Thou thy worldly task hast done,
> Home art gone, and ta'en thy wages:
> Golden lads and girls all must,
> *As chimney-sweepers* come to dust."

In this beautiful passage there is an intimation, by the "chimney-sweepers" being contrasted with the "golden lads and girls," that their employment was regarded as of the meanest, a repute it bears to the present day.

But chimneys seem, like the "sweeps" or "sweepers," to have been a necessity of a change of fuel. In the days of "rere-dosses," our ancestors burnt only wood, so that they were not subjected to so great an inconvenience as we should be were our fires kindled without the vent of the chimney. Our fuel is coal, which produces a greater quantity of soot, and of black smoke, which is the result of imperfect combustion, than any other fuel, the smoke from wood being thin and pure in comparison.

The first mention of the use of coal as fuel occurs in a charter of Henry III., granting licence to the burgesses of Newcastle to dig for coal. In 1281 Newcastle is said to have had some slight trade in this article. Shortly afterwards coal began to be imported into London for the use of smiths, brewers, dyers, soap-boilers, &c. In 1316, during the reign of Edward I., its use in London was prohibited because of the supposed injurious influence of the smoke. In 1600 the use of coal in the metropolis became universal; about 200 vessels were employed in the London trade, and about 200,000 chaldrons annually imported.

In 1848, however, there were, besides the railway-borne coals, 12,267 cargoes imported, or 3,418,340 tons. The London coal trade now employs 2700 vessels and 21,600 seamen, and constitutes one-fourth of the whole general trade of the Thames.

To understand the *necessity* for chimney-sweepers, and the extent of the work for them to do, that is to say, the quantity of soot deposited in our chimneys during the combustion of the three and a half millions of tons of coals that are now annually consumed in London, we must first comprehend the conditions upon which the evolution of soot depends, soot being simply the fine carbonaceous particles condensed from the smoke of coal fuel, and deposited against the sides of the chimneys during its ascent between the walls to the tops of our houses. These conditions appear to have been determined somewhat accurately during the investigations of the Smoke Prevention Committee.

There are two kinds of smoke from the ordinary materials of combustion—(A) *Opaque*, or black smoke; (B) *Transparent*, or invisible smoke.

A. The *Opaque* smoke, though the most offensive and annoying from its dirtying properties, is, like the muddiest water, the least injurious to animal or vegetable health. It consists of the particles of unconsumed carbon which have not been deposited in the form of soot in the flue or chimney. This is the black smoke which will be further described.

B. *Transparent* smoke is composed of gases which are for the most part invisible, such as carbonic acid and carbonic oxide; also of sulphurous acid, but smokes with that component are both visible and invisible. The sulphurous acid is said by Professor Brande to destroy vegetation, for it has long been a cause of wonder why vegetation in towns did not flourish, since carbonic acid (which is so largely produced from the action of our fires) is the vital air of trees, shrubs, and plants*.

screen placed *behind* anything. I am told, that in the old houses in the north of England, erections at the back of the fire may, to this day, occasionally be seen, with an aperture behind for the insertion of plates, and such other things as may require warming.

A correspondent says there is "a 'reredos,' or open fire-hearth, now to be seen in the extensive and beautiful ruins of the Abbey of St. Agatha, in the North Riding of Yorkshire. The ivy now hangs over and partially conceals this reredos; but its form is tolerably perfect, and the stones are still coloured by the action of the fire, which was extinguished, I need hardly say, by the cold water thrown on such places by Henry VIII."

* It has been notorious for many years, that flowers will not bloom in any natural luxuriance, and that fruit will not properly ripen, in the heart of the city. Whilst this is an unquestionable fact, it is also a fact, that greatly as suburban dwellings have increased, and truly as London may be said to have "gone into the country," the greater quantity of the large, excellent, unfailing, and cheap supply of the fruits and vegetables in the London "green" markets are grown within a circle of from ten to twelve miles from St. Paul's. In the course of my inquiries (in the series of letters on Labour and the Poor in the *Morning Chronicle*) into the supply, &c., to the "green markets" of the metropolis, I was told by an experienced market-gardener, who had friends and connections in several of the suburbs, that he fancied, and others in the trade were of the same opinion, that no gardening could be anything but a failure if attempted within "where the fogs went." My informant explained to me that the fogs, so peculiar to London, did not usually extend beyond three or four miles from the heart of the city. He was satisfied, he said, that within half a mile or so of this reach of fog the gardener's labours might be crowned with success. He knew nothing of any scientific reason for his opinion, but as far as a purely London fog extended (without regard to any mist pervading the whole country as well as the neighbourhood of the capital), he thought it was the boundary within which there could be no proper growth of fruit or flowers. That the London fog has its *limits* as regards the manifestation of its greatest density, there can be no doubt. My informant was frequently asked, when on his way home, by omnibus drivers and others whom he knew, and met on their way to town a few miles from it: "How's the fog, sir? *How far?*"

The extent of the London fog, then, if the information I have cited be correct, may be considered as indicating that portion of the metropolis where the population, and consequently the smoke, is the thickest, and within which agricultural and horticultural labours cannot meet with success. "The nuisance of a November fog in London," Mr. Booth stated to the Smoke Committee, "is most assuredly increased by the smoke of the town, arising from furnaces and private fires. It is vapour saturated with particles of carbon which causes all that uneasiness and pain in the lungs, and the uneasy sensations which we experience in our heads. I have no doubt of the density of these fogs arising from this carbonaceous matter."

The loss from the impossibility of promoting vegetation in the district most subjected to the fog is nothing, as the whole ground is already occupied for the thousand purposes of a great commercial city. The matter is, however, highly curious, as a result of the London smoke.

Concerning the frequency of fogs in the district of the immediate neighbourhood of the metropolis, it is stated in Weale's "London," that fogs "appear to be owing, 1st,

I may here observe, that several of the scientific men who gave the results of years of observation and study in their evidence to the Committee of the House of Commons, remarked on the popular misunderstanding of what smoke was, it being generally regarded as something *visible*. But in the composition of smoke, it appears, one product may be visible, and another invisible, and both offensive; while "occasionally you may have from the same materials varieties of products, all invisible, according to the manner to which they are supplied with air."

The Committee requested Dr. Reid to prepare a definition of "smoke," and more especially of "black smoke." The following is the substance of the doctor's definition, or rather description:—

1. *Black Smoke* consists essentially of carbon separated by heat from coal or other combustible bodies. If this smoke be produced at a very high temperature, the carbon forms a loose and powdery soot, comparatively free from other substances; while the lower the temperature at which black soot is formed, the larger is the amount of other substances with which it is mingled, among which are the following:—carbon, water, resin, oily and other inflammable products of various volatilities, ammonia, and carbonate of ammonia.

When the carbon, oils, resin, and water are associated together in certain proportions, they constitute *tar*. *Soft pitch* is produced if the tar be so far heated that the water is expelled; and *hard pitch* (resin blackened by carbon) when the oils are volatilized.

In all cases of ordinary combustion, carbonic acid is formed by the red-hot cinders, or by gases or other compounds containing carbon, acting on the oxygen of the air. This carbonic acid is discharged in general as an *invisible* gas. If the carbonic acid pass through red-hot cinders, or any carbonaceous smoke at a high temperature, it loses one particle of oxygen, and becomes carbonic oxide gas. The lost oxygen, uniting with carbon, forms an additional amount of carbonic oxide gas, which passes to the external atmosphere as an invisible gas, unless kindled in its progress, or at the top of the chimney, when its temperature is sufficiently elevated by the action of air. Carbonic oxide gas burns with a blue flame, and produces carbonic acid gas.

Black smoke is always associated with carburetted hydrogen gases. These may be mechanically blended with the oils and resins, but must be carefully distinguished from them. They form more essentially, when in a state of combustion, the inflammable matters that constitute flame.

2. *Smoke from Charcoal, Coke, and Anthracite*, is always invisible if the material be dry. A flame may appear, however, if carbonic oxide be formed.

3. *Wood or Pyroligneous Smoke* is rarely black. Water and carbonic acid are the products of the full combustion of wood, omitting the consideration of the ash that remains.

4. *Sulphurous Smokes*. Tons of sulphur are annually evolved in various conditions from copper-works. Offensive sulphurous smokes are often evolved from various chemical works, as gas-works, acid-works, &c.

5. *Hydrochloric Acid Smoke* is evolved in general in large quantities from alkali works.

6. *Metallic Smokes*—when ores of lead, copper, arsenic, &c., are used—often contain offensive matter in a minute state of division, and suspended in the smoke evolved from the furnaces.

7. *Putrescent Smokes*, loaded with the products of decayed animal and vegetable matter, are evolved at times from drains in visible vapours, more especially in damp weather. The fœtid particles, when associated with moisture in this smoke, are entirely decomposed when subjected to heat.

Dr. Ure says, speaking of the cause of the ordinary black smoke above described, "The inevitable conversion of atmospheric air into carbonic acid has been hitherto the radical defect of almost all furnaces. The consequence is, that this gaseous matter is mixed with an atmosphere containing far too little oxygen, and instead of burning the carbon and hydrogen, which constitute the coal gases, the carbon is deposited partly in a pulverized form, constituting smoke or soot, and a great deal of the carbon gets half-burnt, and forms what is well known under the name of carbonic oxide, which is half-burnt charcoal."

"The ordinary smoke," Professor Faraday said, in his examination before the Committee, "is the visible black part of the products, the unburnt portions of the carbon. If you prevent the production of carbonic oxide or carbonic acid, you increase the production of smoke. You must with coal fuel either have carbonic acid or oxide, or else black smoke.

"Which is the least noxious?" he was asked, and answered, "As far as regards health, carbonic acid and carbonic oxide are most noxious to health; but it is not so much a question of health as of cleanliness and comfort, because I

to the presence of the river; and, 2ndly, to the fact that the superior temperature of the town produces results precisely similar to those we find to occur upon rivers and lakes. The cold damp currents of the atmosphere, which cannot act upon the air of the country districts, owing to the equality of their specific gravity, when they encounter the warmer and lighter strata over the town, displace the latter, intermixing with it and condensing the moisture. Fogs thus are often to be observed in London, whilst the surrounding country is entirely free from them. The peculiar colour of the London fogs appears to be owing to the fact that, during their prevalence, the ascent of the coal smoke is impeded, and that it is thus mixed with the condensed moisture of the atmosphere. As is well known, they are often so dense as to require the gas to be lighted in midday, and they cover the town with a most dingy and depressing pall. They also frequently exhibit the peculiarity of increasing density after their first formation, which appears to be owing to the descent of fresh currents of cold air towards the lighter regions of the atmosphere.

"They do not occur when the wind is in a dry quarter, as for instance when it is in the east; notwithstanding that there may be very considerable difference in the temperature of the air and of the water or the ground. The peculiar odour which attends the London fogs has not yet been satisfactorily explained; although the uniformity of its recurrence, and its very marked character, would appear to challenge elaborate examination."

believe that this town is as healthy as other places where there are not these fires.

"It is partly the impure coal gas evolved after the fresh charge of coal which originates the smokes, when not properly supplied with air; but it is a very mixed question. When a fresh charge of coal is put upon the fire, a great quantity of evaporable matter, which would be called impure coal gas according to the language of the question, is produced; and as that matter travels on in the heated place, if there be a sufficient supply of air, both the hydrogen and the carbon are entirely burnt. But if there be an insufficient supply of air, the hydrogen is taken possession of first, and the carbon is set free in its black and solid form; and if that goes into the cool part of the chimney before fresh air gets to it, that carbon is so carried out into the atmosphere and is the smoke in question. Generally speaking, the great rush of smoke is when coal is first put on the fire; and that from the want of a sufficient supply of oxygen at the right time, because the carbon is cooled so low as not to take fire."

This eminent chemist stated also that there was no difference in the ultimate chemical effect upon the air between a wood fire and a coal fire, but with wood there was not so much smoke set free in the heated place, which caused a difference in the gaseous products of wood combustion and of coal combustion. He thought that perhaps wood was the fuel which would be most favourable to health as affecting the atmosphere, inasmuch as it produced more water, and less carbonic acid, as the product of combustion.

What may be called the *peculiarities* of a smoky and sooty atmosphere are of course more strongly developed in London than elsewhere, as the following curious statements show:—

Dr. Reid, in describing metropolitan smoke, spoke of "those black portions of soot that every one is familiar with, which annoy us, for instance, at the Houses of Parliament to such an extent that I have been under the necessity of putting up a veil, about 40 feet long and 12 feet deep, on which, on a single evening, taking the worst kind of weather for the production of soot, we can count occasionally 200,000 visible portions of soot excluded at a single sitting. We count with the naked eye the number of pieces entangled upon a square inch. I have examined the amount deposited on different occasions in different parts of London at the tops of some houses; and on one occasion at the Horse Guards the amount of soot deposited was so great, that it formed a complete and continuous film, so that when I walked upon it I saw the impression of my foot left as distinctly on that occasion as when snow lies upon the ground. The film was exceedingly thin, but I could discover no want of continuity. On other occasions I have noticed in London that the quantity that escapes into individual houses is so great that in a single night I have observed a mixture of soot and of hoar frost collecting at the edge of the door, and forming a stripe three-quarters of an inch in breadth, and bearing an exact resemblance to a pepper and salt grey cloth. Those that I refer to are extreme occasions."

Mr. Booth mentioned, that one of the gardeners of the Botanic Garden in the Regent's-park, could tell the number of days sheep had been in the park from the blackness of their wool, its oleaginous power retaining the black.

Dr. Ure informed the Committee that a column of smoke might be seen extending in different directions round London, according to the way of the wind, for a distance of from 20 to 30 miles; and that Sir William Herschel had told him that when the wind blew from London he could not use his great telescope at Slough.

It was stated, moreover, that when a respirator is washed, the water is rendered dirty by the particles of soot adhering to the wire gauze, and which, but for this, would have entered the mouth.

Professor Brande said, on the subject of the public health being affected by smoke, "I cannot say that my opinion is that smoke produces any unhealthiness in London; it is a great nuisance certainly: but I do not think we have any good evidence that it produces disease of any kind."

"This Committee," said Mr. Beckett, "have been told that, by the mechanical effects of smoke upon the chest and lungs, disease takes place; that is, by swallowing a certain quantity of smoke the respiratory organs are injured; can you give any opinion upon that?"—"One would conceive," replied the Professor, "that that is the case; but when we compare the health of London with that of any other town or place where they are comparatively free or quite free from smoke, we do not find that difference which we should expect in regard to health."

Mr. E. Solly, lecturer on chemistry at the Royal Institution, expressed his opinion of the effect of smoke upon the health of towns:—

"My impression is," he said, "that it produces decided evil in two or three ways: first, mechanically; the solid black carbonaceous matter produces a great deal of disease; it occasions dirt amongst the lower orders, and, if they will not take pains to remove it, it engenders disease. If we could do away the smoke nuisance, I believe a great deal of that disease would be put an end to. But there is another point, and that is, the bad effects produced by the gases, sulphurous acid and other compounds of that nature, which are given out. If we do away with smoke, we shall still have those gases; and I have no doubt that those gases produce a great part of the disease that is produced by smoke."

On the other hand Dr. Reid thought that smoke was more injurious from the dirt it created than from causing impurity in the atmosphere, although "it was obvious enough that the inspiration of a sooty atmosphere must be injurious to persons of a delicate constitution." Dr. Ure pronounced smoke, in the common sense of visible black smoke, unwholesome, but "not so eminently as the French imagine."

Many witnesses stated their conviction that where poor people resided amongst smoke, they

HARVARD UNIVERSITY

felt it impossible to preserve cleanliness in their persons or their dwellings, and that made them careless of their homes and indifferent to a decency of appearance, so that the public-house, and places where cleanliness and propriety were in no great estimation, became places of frequent resort, on the plain principle that if a man's home were uncomfortable, he was not likely to stay in it.

"I think," said Mr. Booth, "one great effect of the evil of smoke is upon the dwellings of the poor; it renders them less attentive to their personal appearance, and, in consequence, to their social condition."

It was also stated that there were "certain districts inhabited by the poor, where they will not hang out their clothes to be cleansed; they say it is of no use to do it, they will become dirty as before, and consequently they do not have their clothes washed." The districts specified as presenting this characteristic are St. George's-in-the East and the neighbourhood of Old-street, St. Luke's.

It must not be lost sight of, that whatever evils, moral or physical, without regarding merely pecuniary losses, are inflicted by the excess of smoke, they fall upon the poor, and almost solely on the poor. It is the poor who must reside, as was said, and with a literality not often applicable to popular phrases, "in the thick of it," and consequently there must either be increased washing or increased dirt.

To effect the mitigation of the nuisance of smoke, two points were considered :—

A. The substitution of some other material, containing less bituminous matter, for the "Newcastle coal."

B. The combustion of the smoke, before its emission into the atmospheric air, by means of mechanical contrivances founded on scientific principles.

As regards the first consideration (A) it was recommended that anthracite, or stone Welsh coal, which is a smokeless fuel, should be used instead of the Newcastle coal. This coal is almost the sole fuel in Philadelphia, a city of Quaker neatness beyond any in the United States of North America, and sometimes represented as the cleanest in the world. The anthracite coal is somewhat dearer than Newcastle coal in London, but only in a small degree.

Coke was also recommended as a substitute for coal in private dwellings.

"Are you of opinion," Dr. Reid was asked, "that smoke may be in a great measure prevented by extending the use of gas and coke?" He answered, "In numerous cities, where large quantities of gas are produced, coke is very frequently the principal fuel of the poor, and the difficulty of lighting that coke, and the difficulty of having heat developed by it in sufficient quantity, necessarily led me to look at the construction of the fire-places adapted for it. And on a general review of the question, I do entertain the opinion, that if education were more extended amongst the humblest classes with respect to the economy of their own fireside (I mean, literally, the fire-place, at present), and if gas were greatly extended, so that they did not drain the coal of the gas-works of the last dregs of gaseous matter, which are of very little use as gas, and more to be considered as adding to the bulk for sale than as valuable gas, that a coke might be left which would be easily accendible, which would be economical, and which, if introduced into fire-places where an open fire is desired, would *entirely remove the necessity of sweeping chimneys even with machines*, and would at the same time give as economical a fire as any ordinary fire-place can produce, for an ordinary coal fire rarely is powerful in its calorific emanations till the mass of gas has been expelled, and we see the cherry-red fire. The amount of gas that has escaped previously to the production or coking of the fire, is the gas that is valuable in a manufactory, and if therefore the individual consumer could have, not the hard-burnt stony coke, but the soft coke, in the condition that would give at once a cherry-red fire, we should attain the two great objects—of economising gas, and at the same time of having a lively cheerful fire. Then this led me to look particularly at the price of a gas lamp for a poor man. In a poor man's family, where the breakfast, the tea and dinner, require the principal attention, and he has some plain cooking utensils, in the heat of summer I believe that he will produce as much heat as he wants for those purposes from a single burner, which can be turned on and left all day, which shall not risk any boiling over, and by having this pure heat directed to the object to be warmed, instead of having a heavy iron grate, this plan would, if gas were generally introduced even into the humblest apartments, prove a great source of economy in summer."

Dr. Reid also told the Committee that there was a great prejudice against the use of coke, many persons considering that it produced a sulphurous smell; but as all ordinary coal coked itself, or became coke in an open fire, and was never powerfully calorific till it became coke, the prejudice would die away.

Very little is said in the Report about the smoke of private houses; an allusion, however, is made to that portion of the investigation :—"Your Committee have received the most gratifying assurances of the confident hope entertained by several of the highest scientific authorities examined by them, that the black smoke proceeding from fires in private dwellings, and all other places, may eventually be entirely prevented, either by the adoption of stoves and grates formed for a perfect combustion of the common bituminous coal, or by the use of coke, or of anthracite; but they are of opinion that the present knowledge on that subject is not such as to justify any legislative interference with these smaller fires."

"I should, in prospect," Professor Faraday said to the Committee, "look forward to the possibility of a great reduction of the smoke from coal fires in houses; but my impression is, that, in the present state of things, it would be tyrannical to determine that that must be done which at present we do not know can be done. Still, I think there

is reason to believe that it can be effected in a very high degree."

Dr. Ure also thought that to extend any smoke enactment to private dwellings might be tyrannical in the present state of the chimneys, but he had no doubt that smoke might be consumed in fires in private dwellings.

Such, then, are the causes and remedies for smoke, and consequently of soot, for smoke, or rather opaque smoke, consists, as we have seen, of merely the gases of combustion with minute particles of carbon diffused throughout them; and as smoke is the result of the imperfect burning of our coals, it follows that chimney-sweepers are but a consequence of our ignorance, and that, as we grow wiser in the art of economising our fuel, we shall be gradually displacing this branch of labourers—the means of preventing smoke being simply the mode of displacing the chimney-sweepers—and this is another of the many facts to teach us that not only are we doubling our population in forty years, but we are likewise learning every year how to do our work with a less number of workers, either by inventing some piece of mechanism that will enable one "hand" to do as much as one hundred, or else doing away with some branch of labour altogether. Here lies the great difficulty of the time. A new element—science, with its offspring, steam—has been introduced into our society within the last century, decreasing labour at a time when the number of our labourers has been increasing at a rate unexampled in history; and the problem is, how to reconcile the new social element with the old social institutions, doing as little injury as possible to the community.

Suppose, for instance, the "smoke nuisance" entirely prevented, and that Professor Faraday's prophecy as to the great reduction of the smoke from coal fires in houses were fulfilled, and that the expectations of the sanguine and intense Committee, who tell us that they have "received *the most gratifying* assurances of the *confident* hope entertained by several of *the highest scientific* authorities, that the black smoke proceeding from fires in private dwellings and all other places may be eventually *entirely* prevented,"—suppose that these expectations, I say, be realized (and there appears to be little doubt of the matter), what is to become of the 1000 to 1500 "sweeps" who live, as it were, upon this very smoke? Surely the whole community should not suffer for them, it will be said. True; but unfortunately the same argument is being applied to each particular section of the labouring class,—and the labourers make up by far the greater part of the community. If we are daily displacing a thousand labourers by the annihilation of this process, and another thousand by the improvement of that, what is to be the fate of those we put on one side? and where shall we find employment for the hundred thousand new "hands" that are daily coming into existence among us? This is the great problem for earnest thoughtful men to work out!

But we have to deal here with the chimney-sweepers as they are, and not as they may be in a more scientific age. And, first, as to *the quantity of soot* annually deposited at present in the London chimneys.

The quantity of soot produced in the metropolis every year may be ascertained in the following manner:—

The larger houses are swept in some instances once a month, but generally once in three months, and yield on an average six bushels of soot per year. A moderate-sized house, belonging to the "middle class," is usually swept four times a year, and gives about five bushels of soot per annum; while houses occupied by the working and poorer classes are seldom swept more than twice, and sometimes only once, in the twelvemonth, and yield about two bushels of soot annually.

The larger houses—the residences of noblemen and the more wealthy gentry—may, then, be said to produce an average of six bushels of soot annually; the houses of the more prosperous tradesmen, about five bushels; while those of the humbler classes appear to yield only two bushels of soot per annum. There are, according to the last returns, in round numbers, 300,000 inhabited houses at present in the metropolis, and these, from the "reports" of the income and property tax, may be said to consist, as regards the average rentals, of the proportions given in the next page.

Here we see that the number of houses whose average rental is above 50*l*. is 53,840; while those whose average rental is above 30*l*., and below 50*l*., are 90,002 in number; and those whose rental is below 30*l*. are as many as 163,880; the average rental for all London, 40*l*. Now, adopting the estimate before given as to the proportionate yield of soot from each of these three classes of houses, we have the following items:—

	Bushels of Soot per Annum.
53,840 houses at a yearly rental above 50*l*., producing 6 bushels of soot each per annum	323,040
90,002 houses at a yearly rental above 30*l*. and below 50*l*., producing 5 bushels of soot each per annum .	450,010
163,880 houses at a yearly rental below 30*l*., producing 2 bushels of soot each per annum . . .	327,760
Total number of bushels of soot annually produced throughout London .	1,100,810

This calculation will be found to be nearly correct if tried by another mode. The quantity of soot depends greatly upon the amount of volatile or bituminous matter in the coals used. By a table given at p. 169 of the second volume of this work it will be seen that the proportion of volatile matter contained in the several kinds of coal are as follows:—

Cannel or gas coals contain 40 to 60 per cent. of volatile matter.

Newcastle or "house" coals, about 37 per cent.

Lancashire and Yorkshire coals, 35 to 40 per cent.

South Welsh or "steam" coals, 11 to 15 per cent.

Anthracite or "stone" coals, none.

The house coals are those chiefly used throughout London, so that every ton of such coals contains about 800 lbs. of volatile matter, a considerable proportion of which appears in the form of smoke; but what proportion and what is the weight of the carbonaceous particles or soot evolved in a given quantity of smoke, I know of no means of judging. I am informed, however, by those practically acquainted with the subject, that a ton of ordinary house coals will produce between a fourth and a half of a bushel of soot*. Now there are, say, 3,500,000 tons of coal consumed annually in London; but a large proportion of this quantity is used for the purposes of gas, for factories, breweries, chemical works, and steam-boats. The consumption of coal for the making of gas in London, in 1849, was 380,000 tons; so that, including the quantity used in factories, breweries, &c., we may, perhaps, estimate the domestic consumption of the metropolis at 2,500,000 tons yearly, which, for 300,000 houses, would give eight tons per house. And when we remember the amount used in large houses and in hotels, as well as by the smaller houses, where each room often contains a different family, this does not appear to be too high an average. Mr. M'Culloch estimates the domestic consumption at one ton per head, men, women, and children; and since the number of persons to each house in London is 7·5, this would give nearly the same result. Estimating the yield of soot to be three-eighths of a bushel per ton, we have, in round numbers, 1,000,000 bushels of soot as the gross quantity deposited in the metropolitan chimneys every year.

Or, to check the estimate another way, there are 350 master sweepers throughout London. A master sweeper in a "large way of business" collects, I am informed, one day with another, from 30 to 40 bushels of soot; on the other hand, small master, or "single-handed" chimney-sweeper is able to gather only about 5 bushels, and scarcely that. One master sweeper said that about 10 bushels a day would, he thought, be a fair average quantity for all the masters, reckoning one day with another; so that at this rate we should have 1,095,500 bushels for the gross quantity of soot annually collected throughout the metropolis.

We may therefore assume the aggregate yield of soot throughout London to be 1,000,000 bushels per annum. Now what is done with this immense mass of refuse matter? Of what use is it?

The soot is purchased from the masters, whose

* The quantity of soot deposited depends greatly on the length, draught, and irregular surface of the chimney. The kitchen flue yields by far the most soot for an equal quantity of coals burnt, because it is of greater length. The quantity above cited is the average yield from the several chimneys of a house. It will be seen hereafter that the quantity collected is only 800,000 bushels; a great proportion of the chimneys of the poor being seldom swept, and some cleansed by themselves.

perquisite it is, by the farmers and dealers. It is used by them principally for meadow land, and frequently for land where wheat is grown; not so much, I understand, as a manure, as for some quality in it which destroys slugs and other insects injurious to the crops*. Lincolnshire is one of the great marts for the London soot, whither it is transported by railway. In Hertfordshire, Cambridge, Norfolk, Suffolk, Essex, and Kent, however, and many other parts, London soot is used in large quantities; there are persons who have large stores for its reception, who purchase it from the master sweepers, and afterwards sell it to the farmers and send it as per order, to its destination. These are generally the manure-merchants, of whom the Post-Office Directory gives 26 names, eight being marked as dealers in guano. I was told by a sweeper in a large way of business that he thought these men bought from a half to three-quarters of the soot; the remainder being bought by the land-cultivators in the neighbourhood of London. Soot is often used by gardeners to keep down the insects which infest their gardens.

The value of the Soot collected throughout London is the next subject to engage our attention. Many sweepers have represented it as a very curious fact, and one for which they could advance no sufficient reason, that the price of a bushel of soot was regulated by the price of the quartern loaf, so that you had only to know that the quartern loaf was 5*d*. to know that such was the price of a bushel of soot. This, however, is hardly the case at present; the price of the quartern loaf (not regarding the "seconds," or inferior bread), is now, at the end of December, 1851, 5*d*. to 6*d*. according to quality. The price of soot per bushel is but 5*d*., and sometimes but 4½*d*., but 5*d*. may be taken as an average.

Now 1,000,000 bushels of soot, at 5*d*., will be found to yield 20,833*l*. 6*s*. 8*d*. per annum. But the whole of this quantity is not collected by the chimney-sweepers, for many of the poorer persons seldom have their chimneys swept; and by the table given in another place, it will be seen that not more than 800,000 bushels are obtained in the course of the year by the London "sweeps." Hence we may say, that there are 800,000 bushels of soot annually collected from the London chimneys, and that this is worth not less than 16,500*l*. per annum.

The next question is, how many people are employed in collecting this quantity of refuse matter, and how do they collect it, and what do they get, individually and collectively, for so doing?

To begin with the number of master and journeymen sweepers employed in removing these 800,000 bushels of soot from our chimneys: according to the Census returns, the number of "sweeps" in the metropolis in the years 1841 and 1831 were as follows:—

Chimney-sweepers.	1841.	1831.	Increase in ten years.
Males, 20 years and upwards	619	421	198
„ under 20 years	370	no returns.	
Females, 20 years & upwards	44	„	
	1033		

But these returns, such as they are, include both employers and employed, in one confused mass. To disentangle the economical knot, we must endeavour to separate the number of master sweepers from the journeymen. According to the Post-Office Directory the master sweepers amount to no more than 32, and thus there would be one more than 1000 for the number of the metropolitan journeymen sweepers; these statements, however, appear to be very wide of the truth.

In 1816 it was represented to the House of Commons, that there were within the bills of mortality, 200 masters, all—except the "great gentlemen," as one witness described them, who were about 20 in number—themselves working at the business, and that they had 150 journeymen and upwards of 500 apprentices, so that there must then have been 850 working sweepers altogether, young and old.

These numbers, it must be borne in mind, were comprised in the limits of the bills of mortality 34 years ago. The parishes in the old bills of mortality were 148; there are now in the metropolis proper 176, and, as a whole, the area is much more densely covered with dwelling-houses. Taking but the last ten years, 1841 to 1851, the inhabited houses have increased from 262,737 to 307,722, or, in round numbers, 45,000.

Now in 1811 the number of inhabited houses in the metropolis was 146,019, and in 1821 it was 164,948; hence in 1816 we may assume the inhabited houses to have been about 155,000; and since this number required 850 working sweepers to cleanse the London chimneys, it is but a rule of three sum to find how many would have been required for the same purpose in 1841, when the inhabited houses had increased to 262,737; this, according to Cocker, is about 1400; so that we must come to the conclusion either that the number of working sweepers had not kept pace with the increase of houses, or that the returns of the census were as defective in this respect as we have found them to be concerning the street-sellers, dustmen, and scavagers. Were we to pursue the same mode of calculation, we should find that if 850 sweepers were required to cleanse the chimneys of 155,000 houses, there should be 1687 such labourers in London now that the houses are 307,722 in number.

But it will be seen that in 1816 more than one-half (or 500 out of 850) of the working chimney-sweepers were apprentices, and in 1841 the chimney-sweepers under 20 years of age, if we are to believe the census, constituted more than one-third of the whole body (or 370 out of 1033). Now as the use of climbing boys was prohibited in 1842, of course this large proportion of the

* Soot of coal is said, by Dr. Ure, in his admirable Dictionary of Arts and Manufactures, to contain "sulphate and carbonate of ammonia along with bituminous matter."

trade has been rendered useless; so that, estimating the master and journeymen sweepers at 250 in 1816, it would appear that about 500 would be required to sweep the chimneys of the metropolis at present. To these, of course, must be added the extra number of journeymen necessary for managing the machines. And considering the journeymen to have increased threefold since the abolition of the climbing boys, we must add 300 to the above number, which will make the sum total of the individuals employed in this trade to amount to very nearly 800.

By inquiries throughout the several districts of the metropolis, I find that there are altogether 350 master sweepers at present in London; 106 of these are large masters, who seldom go out on a round, but work to order, having a regular custom among the more wealthy classes; while the other 244 consist of 92 small masters and 152 "single-handed" masters, who travel on various rounds, both in London and the suburbs, seeking custom. Of the whole number, 19 reside within the City boundaries; from 90 to 100 live on the Surrey side, and 235 on the Middlesex side of the Thames (without the City boundaries). A large master employs from 2 to 10 men, and 2 boys; and a small one only 2 men or sometimes 1 man and a boy, while a single-handed master employs no men nor boys at all, but does all the work himself.

The 198 masters employ among them 12 foremen, 399 journeymen, and 62 boys, or 473 hands, and adding to them the single-handed master-men who work at the business themselves, we have 823 working men in all; so that, on the whole, there are not less than between 800 and 900 persons employed in cleansing the London chimneys of their soot.

The next point that presents itself in due order to the mind is, as to the *mode of working among the chimney-sweepers*: that is to say, how are the 800,000 bushels of soot collected from the 300,000 houses by these 820 working sweepers? But this involves a short history of the trade.

Of the Sweepers of Old, and the Climbing Boys.

Formerly the chimneys used to be cleansed by the house servants, for a person could easily stand erect in the huge old-fashioned constructions, and thrust up a broom as far as his strength would permit. Sometimes, however, straw was kindled at the mouth of the chimney, and in that way the soot was consumed or brought down to the ground by the action of the fire. But that there were also regular chimney-sweepers in the latter part of the sixteenth century is unquestionable; for in the days of the First James and Charles, poor Piedmontese, and more especially Savoyards, resorted to England for the express purpose. How long they laboured in this vocation is unknown. The Savoyards, indeed, were then the general showmen and sweeps of Europe, and so they are still in some of the cities of Italy and France.

As regards the first introduction of English children into chimneys—the establishment of the use of climbing boys—nothing appears, according to the representations made to Parliament on several occasions, to be known; and little attention seems to have been paid to the condition of these infants—some were but little better—until about 1780, when the benevolent Jonas Hanway, who is said, but not uncontradictedly, to have been the first person who regularly used an umbrella in the streets of London, called public attention to the matter. In 1788 Mr. Hanway and others brought a bill into Parliament for the better protection of the climbing boys, requiring, among other provisions, all master sweepers to be licensed, and the names and ages of all their apprentices registered. The House of Lords, however, rejected this bill, and the 28th George III., c. 48, was passed in preference. The chief alterations sought to be effected by the new Act were, that no sweeper should have more than six apprentices, and that no boy should be apprenticed at a tenderer age than eight years. Previously there were no restrictions in either of those respects.

These provisions were, however, very generally violated. By one of those "flaws" or omissions, so very common and so little creditable to our legislation, it was found that there was no prohibition to a sweeper's employing his own children at what age he pleased; and "some," or "several," for I find both words used, employed their sons, and occasionally their daughters, in chimney climbing at the ages of six, five, and even between four and five years! The children of others, too, were continually being apprenticed at illegal ages, for no inquiry was made into the lad's age beyond the statement of his parents, or, in the case of parish apprentices, beyond the (in those days) not more trustworthy word of the overseers. Thus boys of six were apprenticed—for apprenticeship was almost universal—as boys of eight, by their parents; while parish officers and magistrates consigned the workhouse orphans, as a thing of course, to the starvation and tyranny which they must have known were very often in store for them when apprenticed to sweepers.

The following evidence was adduced before Parliament on the subject of infant labour in this trade:—

Mr. John Cook, a master sweeper, then of Great Windmill-street and Kentish-town, the first who persevered in the use of the machine years before its use was compulsory, stated that it was common for parents in the business to employ their own children, under the age of seven, in climbing; and that as far as he knew, he himself was only between six and seven when he "came to it;" and that almost all master sweepers had got it in their bills that they kept "small boys for register-stoves, and such like as that."

Mr. T. Allen, another master sweeper, was between four and five when articled to an uncle.

Mr. B. M. Forster, a private gentleman, a member of the "Committee to promote the Superseding of Climbing Boys," said, "Some are put to the

Original from HARVARD UNIVERSITY

employment very young; one instance of which occurred to a child in the neighbourhood of Shoreditch, who was put to the trade at four and a quarter years, or thereabouts. The father of a child in Whitechapel told me last week, that his son began climbing when he was four years and eight months old. I have heard of some still younger, but only from vague report."

This sufficiently proves at what infantine years children were exposed to toils of exceeding painfulness. The smaller and the more slenderly formed the child, the more valuable was he for the sweeping of flues, the interior of some of them, to be ascended and swept, being but seven inches square.

I have mentioned the employment of female children in the very unsuitable labour of climbing chimneys. The following is all the information given on the subject.

Mr. Tooke was asked, "Have you ever heard of female children being so employed?" and replied, "I have heard of cases at Hadley, Barnet, Windsor, and Uxbridge; and I know a case at Witham, near Colchester, of that sort."

Mr. B. M. Foster said, "Another circumstance, which has not been mentioned to the Committee, is, that there are several little girls employed; there are two of the name of Morgan at Windsor, daughters of the chimney-sweeper *who is employed to sweep the chimneys of the Castle;* another instance at Uxbridge, and at Brighton, and at Whitechapel (which was some years ago), and at Headley near Barnet, and Witham in Essex, and elsewhere." He then stated, on being asked, "Do you not think that girls were employed from their physical form being smaller and thinner than boys, and therefore could get up narrower flues?" "The reason that I have understood was, because their parents had not a sufficient number of boys to bring up to the business." Mr. Foster did not know the ages of these girls.

The inquiry by a Committee of the House of Commons, which led more than any other to the prohibition of this infant and yet painful labour in chimney-sweeping, was held in 1817, and they recommended the "preventing the further use of climbing boys in sweeping of chimneys;" a recommendation not carried into effect until 1832. The matter was during the interval frequently agitated in Parliament, but there were no later investigations by Committees.

I will adduce, specifically, the grievances, according to the Report of 1817, of the climbing boys; but will first present the following extract from the evidence of Mr. W. Tooke, a gentleman who, in accordance with the Hon. Henry Grey Bennet, M.P., and others, exerted himself on the behoof of the climbing boys. When he gave his evidence, Mr. Tooke was the secretary to a society whose object was to supersede the necessity of employing climbing boys. He said:—

"In the year 1800, the Society for Bettering the Condition of the Poor took up the subject, but little or nothing appears to have been done upon that occasion, except that the most respectable master chimney-sweepers entered into an association and subscription for promoting the cleanliness and health of the boys in their respective services. The Institution of which I am treasurer, and which is now existing, was formed in February, 1803. In consequence of an anonymous advertisement, a large meeting was held at the London Coffee House, and the Society was established; immediate steps were then taken to ascertain the state of the trade; inspectors were appointed to give an account of all the master chimney-sweepers within the bills of mortality, their general character, their conduct towards their apprentices, and the number of those apprentices. It was ascertained, that the total number of master chimney-sweepers, within the bills of mortality, might be estimated at 200, who had among them 500 apprentices; that not above 20 of those masters were reputable tradesmen in easy circumstances, who appeared generally to conform to the provisions of the Act; and which 20 had, upon an average, from four to five apprentices each. We found about 90 of an inferior class of master chimney-sweepers who averaged three apprentices each, and who were extremely negligent both of the health, morals, and education of those apprentices; and about 90, the remainder of the 200 masters, were a class of chimney-sweepers recently journeymen, who took up the trade because they had no other resource; they picked up boys as they could, who lodged with themselves in huts, sheds, and cellars, in the outskirts of the town, occasionally wandering into the villages round, where they slept on soot-bags, and lived in the grossest filth."

The grievances I have spoken of were thus summed up by the Parliamentary Committee. After referring to the ill-usage and hardships sustained by the climbing boys (the figures being now introduced for the sake of distinctness) it is stated:—

"It is in evidence that (1) they are stolen from" [and sold by] "their parents, and inveigled out of workhouses; (2) that in order to conquer the natural repugnance of the infants to ascend the narrow and dangerous chimneys to clean which their labour is required, blows are used; that pins are forced into their feet by the boy that follows them up the chimney, in order to compel them to ascend it, and that lighted straw has been applied for that purpose; (3) that the children are subject to sores and bruises, and wounds and burns on their thighs, knees, and elbows; and that it will require many months before the extremities of the elbows and knees become sufficiently hard to resist the excoriations to which they are at first subject."

1. With regard to the *stealing or kidnapping of children*—for there was often a difficulty in procuring climbing boys—I find mention in the evidence, as of a matter, but not a very frequent matter, of notoriety. One stolen child was sold to a master sweeper for 8*l*. 8*s*. Mr. G. Revely said:—

"I wish to state to the Committee that case in particular, because it comes home to the better sort of persons in higher life. It seems that the

child, upon being asked various questions, had been taken away: the child was questioned how he came into that situation; he said all that he could recollect was (as I heard it told at that time) that he and his sister, with another brother, were together somewhere, but he could not tell where; but not being able to run so well as the other two, he was caught by a woman and carried away and was sold, and came afterwards into the hands of a chimney-sweeper. He was not afterwards restored to his family, and the mystery was never unravelled; but he was advertised, and a lady took charge of him.

"This child, in 1804, was forced up a chimney at Bridlington in Yorkshire, by a big boy, the younger boy being apparently but four years old. He fell and bruised his legs terribly against the grate. The Misses Auckland of Boynton, who had heard of the child, and went to see him, became interested by his manners, and they took him home with them; the chimney-sweeper, who perhaps got alarmed, being glad to part with him. "Soon after he got to Boynton, the seat of Sir George Strickland, a plate with something to eat was brought him; on seeing a silver fork he was quite delighted, and said, 'Papa had such forks as those.' He also said the carpet in the drawing-room was like papa's; the housekeeper showed him a silver watch, he asked what sort it was—'Papa's was a gold watch;' he then pressed the handle and said, 'Papa's watch rings, why does not yours?' Sir George Strickland, on being told this circumstance, showed him a gold repeater, the little boy pressed the spring, and when it struck, he jumped about the room, saying, 'Papa's watch rings so.' At night, when he was going to bed, he said he could not go to bed until he had said his prayers; he then repeated the Lord's Prayer, almost perfectly. The account he gave of himself was that he was gathering flowers in his mamma's garden, and that the woman who sold him to the sweeper, came in and asked him if he liked riding? He said, 'Yes,' and she told him he should ride with her. She put him on a horse, after which they got into a vessel, and the sails were put up, 'and away we went.' He had no recollection of his name, or where he lived, and was too young to think his father could have any other name than that of papa. He started whenever he heard a servant in the family at Boynton called George, and looked as if he expected to see somebody he knew; on inquiry, he said he had an uncle George, whom he loved dearly. He says his mamma is dead, and it is thought his father may be abroad. From many things he says, he seems to have lived chiefly with an uncle and aunt, whom he invariably says were called Mr. and Mrs. Flembrough. From various circumstances, it is thought impossible he should be the child of the woman who sold him, his manners being 'very civilized,' quite those of a child well educated; his dialect is good, and that of the south of England. This little boy, when first discovered, was conjectured to be about four years old, and is described as having beautiful black eyes and eyelashes, a high nose, and a delicate soft skin."

Mr. J. Harding, a master sweeper, had a fellow apprentice who had been enticed away from his parents. "It is a case of common occurrence," he said, "for children stolen, to be employed in this way. Yes, and children in particular are enticed out of workhouses: there are a great many who come out of workhouses."

The following cases were also submitted to the Committee:—

"A poor woman had been obliged by sickness to go into an hospital, and while she was there her child was stolen from her house, taken into Staffordshire, and there apprenticed to a chimney-sweeper. By some happy circumstance she learned his fate; she followed him, and succeeded in rescuing him from his forlorn situation. Another child, who was an orphan, was tricked into following the same wretched employment by a chimney-sweeper, who gave him a shilling, and made him believe that by receiving it he became his apprentice; the poor boy, either discovering or suspecting that he had been deceived, anxiously endeavoured to speak to a magistrate who happened to come to the house in which he was sweeping chimneys, but his master watched him so closely that he could not succeed. He at last contrived to tell his story to a blind soldier, who determined to right the poor boy, and by *great exertions* succeeded in procuring him his liberty."

It was in country places, however, that the stealing and kidnapping of children was the most frequent, and the threat of "the sweeps will get you" was often held out, to deter children from wandering. These stolen infants, it is stated, were usually conveyed to some distance by the vagrants who had secured them, and sold to some master sweeper, being apprenticed as the child of the vendors, for it was difficult for sweepers in thinly-peopled places to get a supply of climbing boys. It was shown about the time of the Parliamentary inquiry, in the course of a trial at the Lancaster assizes, that a boy had been apprenticed to a sweeper by two travelling tinkers, man and woman, who informed him that the child was stolen from another "traveller," 80 miles away, who was "too fond of it to make it a sweep." The *price* of the child was not mentioned.

Respecting the sale of children to be apprentices to sweepers, Mr. Tooke was able to state that, although in 1816, the practice had very much diminished of late, parents in many instances still *sold their children for three, four, or five guineas.* This sum was generally paid under the guise of an apprentice fee, but it was known to be and was called a "sale," for the parents, real or nominal, never interfered with the master subsequently, but left the infant to its fate.

2. I find the following account of the *means resorted to, in order to induce, or more frequently compel, these wretched infants to work.*

The boy in the first instance went for a month, or any term agreed upon, "on trial," or "to see how he would suit for the business." During this period of probation he was usually well treated and well fed (whatever the character of the master), with little to do beyond running

errands, and observing the mode of work of the experienced climbers. When, however, he was "bound" as an apprentice, he was put with another lad who had been for some time at the business. The new boy was sent first up the chimney, and immediately followed by the other, who instructed him how to ascend. This was accomplished by the pressure of the knees and the elbows against the sides of the flue. By pressing the knees tightly the child managed to raise his arms somewhat higher, and then by pressing his elbows in like manner he contrived to draw up his legs, and so on. The inside of the flue presented a smooth surface, and there were no inequalities where the fingers or toes could be inserted. Should the young beginner fall, he was sure to light on the shoulders of the boy beneath him, who always kept himself firmly fixed in expectation of such a mishap, and then the novice had to commence anew; in this manner the twain reached the top by degrees, sweeping down the soot, and descended by the same method. This practice was very severe, especially on new boys, whose knees and elbows were torn by the pressure and the slipping down continually—the skin being stripped off, and frequently breaking out in frightful sores, from the constant abrasions, and from the soot and dirt getting into them.

In his evidence before Parliament in 1817 (for there had been previous inquiries), Mr. Cook gave an account of the training of these boys, and on being asked:—"Do the elbows and knees of the boys, when they first begin the business, become very sore, and afterwards get callous, and are those boys employed in sweeping chimneys during the soreness of those parts?" answered, "It depends upon the sort of master they have got; some are obliged to put them to work sooner than others; you must keep them a little at it, or they will never learn their business, even during the sores." He stated further, that the skin broke generally, and that the boys could not ascend chimneys during the sores without *very* great pain. The way that I learn boys is," he continued, "to put some cloths over their elbows and over their knees till they get the nature of the chimney—till they get a little used to it: we call it *padding* them, and then we take them off, and they get very little grazed indeed after they have got the art; but very few will take that trouble. Some boys' flesh is far worse than others, and it takes more time to harden them." He was then asked:—"Do those persons still continue to employ them to climb chimneys?" and the answer was: "Some do; it depends upon the character of the master. None of them of that class keep them till they get well; none. They are obliged to climb with those sores upon them. I never had one of my own apprentices do that." This system of padding, however, was but little practised; but in what proportion it *was* practised, unless by the respectable masters, who were then but few in number, the Parliamentary papers, the only information on the subject now attainable, do not state. The inference is, that the majority, out of but 20 of these masters, with some 80 or 100 apprentices, did treat them well, and what was so accounted. The customary way of training these boys, then, was such as I have described; some even of the better masters, whose boys were in the comparison well lodged and fed, and "sent to the Sunday school" (which seems to have comprised all needful education), considered "padding and such like" to be "new-fangled nonsense."

I may add also, that although the boy carried up a brush with him, it was used but occasionally, only when there were "turns" or defects in the chimney, the soot being brought down by the action of the shoulders and limbs. The climber wore a cap to protect his eyes and mouth from the soot, and a sort of flannel tunic, his feet, legs, and arms being bare. Some of these lads were surprisingly quick. One man told me that, when in his prime as a climbing boy, he could reach the top of a chimney about as quickly as a person could go up stairs to the attics.

The following is from the evidence of Mr. Cook, frequently cited as an excellent master:—

"What mode do you adopt to get the boy to go up the chimney in the first instance?—We persuade him as well as we can; we generally practise him in one of our own chimneys first; one of the boys who knows the trade goes up behind him, and when he has practised it perhaps ten times, though some will require twenty times, they generally can manage it. The boy goes up with him to keep him from falling; after that, the boy will manage to go up with himself, after going up and down several times with one under him: we do this, because if he happens to make a slip he will be caught by the other.

"Do you find many boys show repugnance to go up at first?—Yes, most of them.

"And if they resist and reject, in what way do you force them up?—By telling them we must take them back again to their father and mother, and give them up again; and their parents are generally people who cannot maintain them.

"So that they are afraid of going back to their parents for fear of being starved?—Yes; they go through a deal of hardship before they come to our trade.

"Did you use any more violent means?—Sometimes a rod.

"Did you ever hear of straw being lighted under them?—Never.

"You never heard of any means being made use of, except being beat and being sent home?—No; no other.

"You are aware, of course, that those means being gentle or harsh must depend very much upon the character of the individual master?—It does.

"Of course you must know that there are persons of harsh and cruel disposition; have you not often heard of masters treating their apprentices with great cruelty, particularly the little boys, in forcing them to go up those small flues, which the boys were unwilling to ascend?—Yes; I have forced up many a one myself.

"By what means?—By threatenings, and by giving them a kick or a slap."

It was also stated that the journeymen used the boys with greater cruelty than did the masters—indeed a delegated tyranny is often the worst—that for very little faults they kicked and slapped the children, and sometimes flogged them with a cat, "made of rope, hard at each end, and as thick as your thumb."

Mr. John Fisher, a master chimney-sweeper, said:—"Many masters, are very severe with their children. To make them go up the chimneys I have seen them make them strip themselves naked; I have been obliged myself to go up a chimney naked."

As respects the cruelties of driving boys up chimneys by kindling straw beneath their feet, or thrusting pins into the soles of their feet, I find the following statements given on the authority of B. M. Forster, Esq., a private gentleman residing in Walthamstow:—

"A lad was ordered to sweep a chimney at Wandsworth; he came down after endeavouring to ascend, and this occurred several times before he gave up the point; at last the journeyman took some straw or hay, and lighted it under him to drive him up: when he endeavoured to get up the last time, he found there was a bar across the chimney, which he could not pass; he was obliged in consequence to come down, and the journeyman beat him so cruelly, to use his own expression, that he could not stand for a fortnight.

"In the whole city of Norwich I could find only nine climbing boys, two of whom I questioned on many particulars; one was with respect to the manner in which they are taught to climb; they both agreed in that particular, that a larger boy was sent up behind them to prick their feet, if they did not climb properly. I purposely avoided mentioning about pricking them with pins, but asked them how they did it; they said that they thrust the pins into the soles of their feet. A third instance occurred at Walthamstow; a man told me that some he knew had been taught in the same way; I believe it to be common, but I cannot state any more instances from authority."

3. On the subject of the *sores, bruises, wounds, burns, and diseases*, to which chimney-sweepers in their apprenticeships were not only exposed, but, as it were, condemned, Mr. R. Wright, a surgeon, on being examined before the Committee, said, "I shall begin with *Deformity*. I am well persuaded that the deformity of the spine, legs, arms, &c., of chimney-sweepers, generally, if not wholly, proceeds from the circumstance of their being obliged not only to go up chimneys at an age when their bones are in a soft and growing state, but likewise from their being compelled by their too merciless masters and mistresses to carry bags of soot (and those very frequently for a great length of distance and time) by far too heavy for their tender years and limbs. The knees and ancle joints mostly become deformed, in the first instance, from the position they are obliged to put them in, in order to support themselves, not only while climbing up the chimney, but more particularly so in that of coming down, when they rest solely on the lower extremities.

"*Sore eyes and eyelids*, are the next to be considered. Chimney-sweepers are very subject to inflammation of the eyelids, and not unfrequently weakness of sight, in consequence of such inflammation. This I attribute to the circumstance of the soot lodging on the eyelids, which first produces irritability of the part, and the constantly rubbing them with their dirty hands, instead of alleviating, increases the disease; for I have observed in a number of cases, when the patient has ceased for a time to follow the business, and of course the original cause has been removed, that with washing and keeping clean they were soon got well.

"*Sores*, for the same reasons, are generally a long time in healing.

"*Cancer* is another and a most formidable disease, which chimney-sweepers in particular are liable to, especially that of the scrotum; from which circumstance, by way of distinction, it is called the 'chimney-sweeper's cancer.' Of this sort of cancer I have seen several instances, some of which have been operated on; but, in general, they are apt to let them go too far before they apply for relief. Cancers of the lips are not so general as cancers of the scrotum. I never saw but two instances of the former, and several of the latter."

The "chimney-sweep's cancer" was always lectured upon as a separate disease at Guy's and Bartholomew's Hospitals, and on the question being put to Mr. Wright: "Do the physicians who are intrusted with the care and management of those hospitals think that disease of such common occurrence, that it is necessary to make it a part of surgical education?"—he replied: "Most assuredly; I remember Mr. Cline and Mr. Cooper were particular on that subject; and having one or two cases of the kind in the hospital, it struck my mind very forcibly. With the permission of the Committee I will relate a case that occurred lately, which I had from one of the pupils of St. Thomas's Hospital; he informed me that they recently had a case of a chimney-sweeper's cancer, which was to have been operated on that week, but the man 'brushed' (to use their expression) or rather walked off; he would not submit to the operation: similar instances of which I have known myself. They dread so much the knife, in consequence of foolish persons telling them it is so formidable an operation, and that they will die under it. I conceive without the operation it is death; for cancers are of that nature that unless you extricate them entirely they will never be cured."

Of the chimney-sweeper's cancer, the following statement is given in the Report: "Mr. Cline informed your Committee by letter, that this disease is rarely seen in any other persons than chimney-sweepers, and in them cannot be considered as frequent; for during his practice in St. Thomas's hospital, for more than 40 years, the number of those could not exceed 20. But your Committee have been informed that the dread of the operation which it is necessary to perform, deters many from submitting to it; and from the

Original from HARVARD UNIVERSITY

evidence of persons engaged in the trade, it appears to be much more common than Mr. Cline seems to be aware of.

"*Cough and Asthma.*—Chimney-sweepers are, from their being out at all hours and in all weathers, very liable to cough and inflammation of the chest.

"*Burns.*—They are very subject to burns, from their being forced up chimneys while on fire, or soon after they have been on fire, and while overheated; and however they may cry out, their inhuman masters pay not the least attention, but compel them, too often with horrid imprecations, to proceed.

"*Stunted growth*, in this unfortunate race of the community, is attributed, in a great measure, to their being brought into the business at a very early age."

To *accidents* they were frequently liable in the pursuit of their callings, and sometimes these accidents were the being jammed or fixed, or, as it was called in the trade, "stuck," in narrow and heated flues, sometimes for hours, and until death.

Among these hapless lads were indeed many deaths from accidents, cruelty, privation, and exhaustion, but it does not appear that the number was ever ascertained. There were also many narrow escapes from dreadful deaths. I give instances of each:—

"On Monday morning, the 29th of March, 1813, a chimney-sweeper of the name of Griggs, attended to sweep a small chimney in the brewhouse of Messrs. Calvert and Co., in Upper Thames-street; he was accompanied by one of his boys, a lad of about eight years of age, of the name of Thomas Pitt. The fire had been lighted as early as two o'clock the same morning, and was burning on the arrival of Griggs and his little boy at eight: the fire-place was small, and an iron pipe projected from the grate some little distance, into the flue; this the master was acquainted with (having swept the chimneys in the brewhouse for some years) and therefore had a tile or two taken from the roof, in order that the boy might descend the chimney. He had no sooner extinguished the fire than he suffered the lad to go down; and the consequence, as might be expected, was his almost immediate death, in a state, no doubt, of inexpressible agony. The flue was of the narrowest description, and must have retained heat sufficient to have prevented the child's return to the top, even supposing he had not approached the pipe belonging to the grate, which must have been nearly red-hot; this, however, was not clearly ascertained on the inquest, though the appearance of the body would induce an opinion that he had been unavoidably pressed against the pipe. Soon after his descent, the master, who remained on the top, was apprehensive that something had happened, and therefore desired him to come up; the answer of the boy was, 'I cannot come up, master; I must die here.' An alarm was given in the brewhouse, immediately, that he had stuck in the chimney, and a bricklayer who was at work near the spot attended, and after knocking down part of the brickwork of the chimney, just above the fire-place, made a hole sufficiently large to draw him through. A surgeon attended, but all attempts to restore life were ineffectual. On inspecting the body, various burns appeared; the fleshy part of the legs, and a great part of the feet more particularly, were injured; those parts, too, by which climbing boys most effectually ascend or descend chimneys, viz., the elbows and knees, seemed burnt to the bone; from which it must be evident that the unhappy sufferer made some attempts to return as soon as the horrors of his situation became apparent."

"In the improvement made some years since by the Bank of England, in Lothbury, a chimney, belonging to a Mr. Mildrum, a baker, was taken down, but before he began to bake, in order to see that the rest of the flue was clear, a boy was sent up, and after remaining some time, and not answering to the call of his master, another boy was ordered to descend from the top of the flue and to meet him half-way; but this being found impracticable, they opened the brickwork in the lower part of the flue, and found the first-mentioned boy dead. In the mean time the boy in the upper part of the flue called out for relief, saying, he was completely jammed in the rubbish and was unable to extricate himself. Upon this a bricklayer was employed with the utmost expedition, but he succeeded only in obtaining a lifeless body. The bodies were sent to St. Margaret's Church, Lothbury, and a coroner's inquest, which sat upon them, returned the verdict—Accidental Death."

"In the beginning of the year 1808, a chimney-sweeper's boy being employed to sweep a chimney in Marsh-street, Walthamstow, in the house of Mr. Jeffery, carpenter, unfortunately, in his attempt to get down, stuck in the flue and was unable to extricate himself. Mr. Jeffery, being within hearing of the boy, immediately procured assistance. As the chimney was low, and the top of it easily accessible from without, the boy was taken out in about ten minutes, the chimney-pot and several rows of bricks having been previously removed; if he had remained in that dreadful situation many minutes longer, he must have died. His master was sent for, and he arrived soon after the boy had been released; he abused him for the accident, and, after striking him, sent him with a bag of soot to sweep another chimney. The child appeared so very weak when taken out that he could scarcely stand, and yet this wretched being, who had been up ever since three o'clock, had before been sent by his master to Wanstead, which with his walk to Marsh-street made about five miles."

"In May, 1817, a boy employed in sweeping a chimney in Sheffield got wedged fast in one of the flues, and remained in that situation near two hours before he could be extricated, which was at length accomplished by pulling down part of the chimney."

On one occasion a child remained above two hours in some danger in a chimney, rather than

venture down and encounter his master's anger. The man was held to bail, which he could not procure.

As in the cases I have described (at Messrs. Calvert's, and in Lothbury), the verdict was usually "Accidental Death," or something equivalent.

It was otherwise, however, where wilful cruelty was proven.

The following case was a subject of frequent comment at the time:—

"On Friday, 31st May, 1816, William Moles and Sarah his wife, were tried at the Old Bailey for the wilful murder of John Hewley, alias Haseley, a boy about six years of age, in the month of April last, by cruelly beating him. Under the direction of the learned judge, they were acquitted of the crime of murder, but the husband was detained to take his trial as for a misdemeanor, of which he was convicted upon the fullest evidence, and sentenced to two years' imprisonment. The facts, as proved in this case, are too shocking in detail to relate: the substance of them is, that he was forced up the chimney on the shoulder of a bigger boy, and afterwards violently pulled down again by the leg and dashed upon a marble hearth; his leg was thus broken, and death ensued in a few hours, and on his body and knees were found scars arising from wounds of a much older date."

This long-continued system of cruelties, of violations of public and private duties, bore and ripened its natural fruits. The climbing boys grew up to be unhealthy, vicious, ignorant, and idle men, for during their apprenticeships their labour was over early in the day, and they often passed away their leisure in gambling in the streets with one another and other children of their stamp, as they frequently had halfpence given to them. They played also at "chuck and toss" with the journeymen, and of course were stripped of every farthing. Thus they became indolent and fond of excitement. When a lad ceased to be an apprentice, although he might be but 16, he was too big to climb, and even if he got employment as a journeyman, his remuneration was wretched, only 2*s.* a week, with his board and lodging. There were, however, far fewer complaints of being insufficiently fed than might have been expected, but the sleeping places were execrable: "They sleep in different places," it was stated, "sometimes in sheds, and sometimes in places which we call barracks (large rooms), or in the cellar (where the soot was kept); some never sleep upon anything that can be called a bed; some do."

Mr. T. Allen, a master sweep for 22 years, gave the Committee the following account of *the men's earnings and* (what may be called) *the General Perquisites of the trade* under the exploded system:—

"If a man be 25 years of age, he has no more than 2*s.* a week; he is not clothed, only fed and lodged in the same manner as the boys. The 2*s.* a week is not sufficient to find him clothes and other necessaries, certainly not; it is hardly enough to find him with shoe-leather, for they walk over a deal of ground in going about the streets. The journeyman is able to live upon those wages, for he gets halfpence given him: supposing he is 16 or 20 years of age, he gets the boys' pence from them and keeps it; and if he happens to get a job for which he receives a 1*s.*, he gets 6*d.* of that, and his master the other 6*d.* The boys' pence are what the boys get after they have been doing their master's work; they get a 1*d.* or so, and the journeyman takes it from them, and 'licks' them if they do not give it up." [These "jobs," after the master's work had been done, were chance jobs, as when a journeyman on his round was called on by a stranger, and unexpectedly, to sweep a chimney. Sometimes, by arrangement of the journeyman and the lad, the proceeds never reached the master's pocket. Sometimes, but rarely, such jobs were the journeyman's rightful perquisite.] "Men," proceeds Mr. Allen, "who are 22 and 23 years of age will play with the young boys and win their money. That is, they get half the money from them by force, and the rest by fraud. They are driven to this course from the low wages which the masters give them, because they have no other means to get anything for themselves, not even the few necessaries which they may want; for even what they want to wash with they must get themselves. As to what becomes of the money the boys get on May-day, when they are in want of clothes, the master will buy them, as check shirts or handkerchiefs. These masters get a share of the money which the boys collect on May-day. The boys have about 1*s.* or 1*s.* 6*d.*; the journeyman has also his share; then the master takes the remainder, which is to buy the boys' clothes and other necessaries, as they say. I cannot exactly tell what the average amount is that a boy will get on the May-day; the most that my boy ever got was 5*s.* But I think that the boys get more than that; I should think they get as much as 9*s.* or 10*s.* apiece. The Christmas-boxes are generally, I believe, divided among themselves (among the boys); but I cannot say rightly. It is spent in buying silk handkerchiefs, or Sunday shoes, I believe; but I am not perfectly sure."

Of the condition and lot of the operatives who were too big to go up chimneys, Mr. J. Fisher, a master-sweeper, gave the following account:— "*They get into a roving way, and go about from one master to another, and they often come to no good end at last.* They sometimes go into the country, and after staying there some time, they come back again; I took a boy of that sort very lately and kept him like my own, and let him go to school; he asked me one Sunday to let him go to school, and I was glad to let him go, and I gave him leave; he accordingly went, and I have seen nothing of him since; before he went he asked me if I would let him come home to see my child buried; I told him to ask his schoolmaster, but he did not come back again. I cannot tell what has become of him; he was to have served me for twelve months. I did not take him

from the parish; he came to me. He said his parents were dead. *The effect of the roving habit of the large boys when they become too large to climb, is, that they get one with another and learn bad habits from one another; they never will stop long in any one place.* They frequently go into the country and get various places; perhaps they stop a month at each; some try to get masters themselves, and some will get into bad company, which very often happens. *Then they turn thieves, they get lazy, they won't work, and people do not like to employ them lest they should take anything out of their houses. The generality of them never settle in any steady business.* They generally turn loose characters, and people will not employ them lest they should take anything out of the house."

The criminal annals of the kingdom bear out the foregoing account. Some of these boys, indeed, when they attained man's estate, became, in a great measure, through their skill in climbing, expert and enterprising burglars, breaking into places where few men would have cared to venture. One of the most daring feats ever attempted and accomplished was the escape from Newgate by a sweeper about 15 years ago. He climbed by the aid of his knees and elbows a height of nearly 80 feet, though the walls, in the corner of the prison-yard, where this was done, were nearly of an even surface; the slightest slip could not have failed to have precipitated the sweeper to the bottom. He was then under sentence of death for highway robbery.

"His name was Whitehead, and he done a more wonderfuller thing nor that," remarked an informant, who had been his master. "We was sweeping the bilers in a sugar-house, and he went from the biler up the flue of the chimney, it was nearly as high as the Monument, that chimney; I should say it was 30 or 40 feet higher nor the sugar-house. He got out at the top, and slid down the bare brickwork on the outside, on to the roof of the house, got through an attic window in the roof, and managed to get off without any one knowing what became of him. That was the most wonderfullest thing I ever knowed in my life. I don't know how he escaped from being killed, but he was always an oudacious feller. It was nearly three months after afore we found him in the country. I don't know where they sent him to after he was brought back to Newgate, but I hear they made him a turnkey in a prison somewhere, and that he's doing very well now." The feat at the sugar-house could be only to escape from his apprenticeship.

In the course of the whole Parliamentary evidence the sweepers, reared under the old climbing system, are spoken of as a "short-lived" race, but no statistics could be given. Some died old men in middle age, in the workhouses. *Many were mere vagrants at the time of their death.*

I took the statement of a man who had been what he called a "climbing" in his childhood, but as he is now a master-sweeper, and has indeed gone through all grades of the business, I shall give it in my account of the present condition of the sweepers.

Climbing is still occasionally resorted to, especially when repairs are required, "but the climbing boys," I was told, "are now men." These are slight dwarfish men, whose services are often in considerable request, and cannot at all times be commanded, as there are only about twenty of them in London, so effectually has climbing been suppressed. These little men, I was told, did pretty well, not unfrequently getting 2*s.* or 2*s.* 6*d.* for a single job.

As regards the *labour question*, during the existence of the climbing boys, we find in the Report the following results:—

The *nominal* wages to the journeymen were 2*s.* a week, with board and lodging. The apprentices received no wages, their masters being only required to feed, lodge, and clothe them.

The *actual* wages were the same as the nominal, with the addition of 1*s.* as perquisites in money. There were other perquisites in liquor or broken meat.

In the Reports are no accounts of the duration of labour throughout the year, nor can I obtain from master-sweepers, who were in the business during the old mode, any sufficient data upon which to found any calculations. The employment, however, seems to have been generally *continuous*, running through the year; though in the course of the twelvemonth one master would have four and another six different journeymen, but only one at a time. The vagrant propensities of the class is a means of accounting for this.

The *nominal* wages of those journeymen who resided in their own apartments were generally 14*s.* a week, and their *actual* about 2*s.* 6*d.* extra in the form of perquisites. Others resided "on the premises," having the care of the boys, with board and lodgings and 5*s.* a week in money *nominally*, and 7*s.* 6*d.* *actually*, the perquisites being worth 2*s.* 6*d.*

Concerning the *general* or average wages of the whole trade, I can only present the following computation.

Mr. Tooke, in his evidence before the House of Commons, stated that the Committee, of which he was a member, had ascertained that one boy on an average swept about four chimneys daily, at prices varying from 6*d.* to 1*s.* 6*d.*, or a medium return of about 10*d.* per chimney, exclusive of the soot, then worth 8*d.* or 9*d.* a bushel. "It appears," he said, "from a datum I have here, that those chimney-sweepers who keep six boys (the greatest number allowed by law) gain, on an average, nearly 270*l.*; five boys, 225*l.*; four boys, 180*l.*; three boys, 135*l.*; two boys, 90*l.*; and one boy 45*l.* (yearly), exclusive of the soot, which is, I should suppose, upon an average, from half a bushel to a bushel every time the chimney is swept."

"Out of the profits you mention," he was then asked, "the master has to maintain the boys?"—"Yes," was the answer, "and when the expenses of house and cellar rent, and the wages of journeymen, and the maintenance of apprentices, are

taken into the account, the number of master chimney-sweepers is not only more than the trade will support, but exceeds, by above one-third, what the public exigency requires. The Committee also ascertained that the 200 master chimney-sweepers in the metropolis were supposed to have in their employment 150 journeymen and 500 boys."

The matter may be reduced to a tabular form, expressing the amount in money—for it is not asserted that the masters generally gained on the charge for their journeymen's board and lodging—as follows:—

EXPENDITURE OF MASTER CHIMNEY-SWEEPERS UNDER THE CLIMBING-BOY SYSTEM.

	Yearly.
20 journeymen at individual wages, 14s. each weekly	£780
30 ditto, say 12s. weekly . .	936
100 ditto, 10s. ditto	2,600
Board, Lodging, and Clothing of 500 boys, 4s. 6d. weekly	5,850
Rent, 20 large traders, 10s. . .	520
Do. 30 others, 7s.	546
Do. 150 do., 3s. 6d.	1,365
20 horses (keep), 10s.	520
General wear and tear	200
	£13,317

It appears that about 180 of the master chimney-sweepers were themselves working men, in the same way as their journeymen.

The following, then, may be taken as the—

YEARLY RECEIPTS OF THE MASTER SWEEPERS UNDER THE CLIMBING-BOY SYSTEM.

	Yearly.
Payment for sweeping 624,000 chimneys (4 daily, according to evidence before Parliament, by each of 500 boys), 10d. per chimney, or yearly	£26,000
Soot (according to same account), say 5d. per chimney	13,000
Total	£39,000
Yearly expenditure	13,317
Yearly profit . .	£25,683

This yielded, then, according to the information submitted to the House of Commons Select Committee, as the profits of the trade prior to 1817, an individual yearly gain to each master sweeper of 128*l.*; but, taking Mr. Tooke's average yearly profit for the six classes of tradesmen, 270*l.*, 225*l.*, 180*l.*, 135*l.*, 90*l.*, and 45*l.* respectively, the individual profit averages above 157*l.*

The capital, I am informed, would not average above two guineas per master sweeper, nothing being wanted beyond a few common sacks, made by the sweepers' wives, and a few brushes. Only about 20 had horses, but barrows were occasionally hired at a busy time.

In the foregoing estimates I have not included any sums for apprentice fees, as I believe there would be something like a balance in the matter, the masters sometimes paying parents such premiums for the use of their children as they received from the parishes for the *tuition* and maintenance of others.

Of the *morals, education, religion, marriage,* &c., of sweepers, under the two systems, I shall speak in another place.

It may be somewhat curious to conclude with a word of the extent of chimneys swept by a climbing boy. One respectable master-sweeper told me that for eleven years he had climbed five or six days weekly. During this period he thought he had swept fifteen chimneys as a week's average, each chimney being at least 40 feet in height; so traversing, in ascending and descending, 686,400 feet, or 130 miles of a world of soot. This, however, is little to what has been done by a climber of 30 years' standing, one of the little men of whom I have spoken. My informant entertained no doubt that this man had, for the first 22 years of his career, climbed half as much again as he himself had; or had traversed 2,059,200 feet of the interior of chimneys, or 390 miles. Since the new Act this man had of course climbed less, but had still been a good deal employed; so that, adding his progresses for the last 9 years to the 22 preceding, he must have swept about 456 miles of chimney interiors.

OF THE CHIMNEY-SWEEPERS OF THE PRESENT DAY.

THE chimney-sweepers of the present day are distinguished from those of old by the use of machines instead of climbing boys, for the purpose of removing the soot from the flues of houses.

The chimney-sweeping machines were first used in this country in the year 1803. They were the invention of Mr. Smart, a carpenter, residing at the foot of Westminster-bridge, Surrey. On the earlier trials of the machine (which was similar to that used at present, and which I shall shortly describe), it was pronounced successful in 99 cases out of 100, according to some accounts, but failing where sharp angles occurred in the flue, which arrested its progress.

"Means have been suggested," said Mr. Tooke, formerly mentioned, in his evidence before a Committee of the House of Commons, "for obviating that difficulty by fixed apparatus at the top of the flue with a jack-chain and pulley, by which a brush could be worked up and down, or it could be done as is customary abroad, as I have repeatedly seen it at Petersburgh, and heard of its being done universally on the Continent, by letting down a bullet with a brush attached to it from the top; but to obviate the inconvenience, which is considerable, from persons going upon the roof of a house, Mr. John White, junior, an eminent surveyor, has suggested the expediency of putting iron shutters or registers to each flue, in the roof or cockloft of each house; by opening which, and working the machine upwards and downwards, or letting down the bullet, which is the most compendious manner, the chimney will be most effectually cleansed; and, by its aperture at bottom being kept well closed, it would be done with

Original from HARVARD UNIVERSITY

the least possible dirt and inconvenience to the family."

The society for the supersedence of the labour of climbing boys promoted the adoption of the machines by all the means in their power, presenting the new instrument gratuitously to several master sweepers who were too poor to purchase it. Experiments were made and duly published as to the effectual manner in which the chimneys at Guildhall, the Mansion House, the then new Custom House, Dulwich College, and in other public edifices, had been cleansed by the machine. But these statements seem to have produced little effect. People thought, perhaps, that the mechanical means which might very well cleanse the chimneys of large public buildings—and it was said that the chimneys of the Custom House were built with a view to the use of the machine—might not be so serviceable for the same purposes in small private dwellings. Experiments continued to be made, often in the presence of architects, of the more respectable sweepers, and of ladies and gentlemen who took a philanthropic interest in the question, between the years 1803 and 1817, but with little influence upon the general public, for in 1817 Mr. Smart supposed that there were but 50 or 60 machines in general use in the metropolis, and those, it appeared from the evidence of several master sweepers, were used chiefly in gentlemen's houses, many of those gentlemen having to be authoritative with their servants, who, if not controlled, always preferred the services of the climbing boys. Most servants had perquisites from the master sweepers, in the largest and most profitable ways of business, and they seemed to fear the loss of those perquisites if any change took place.

The opposition in Parliament, and in the general indifference of the people, to the efforts of "the friends of the climbing boy" to supersede his painful labours by the use of machinery, was formidable enough, but that of the servants appears to have been more formidable still. Mr. Smart showed this in his explanations to the Committee. The whole result of his experience was that servants set their faces against the introduction of the machine, grumbling if there were not even the appearance of dirt on the furniture after its use. "The first winter I went out with this machine," said Mr. Smart, "I went to Mr. Burke's in Tokenhouse Yard, who was a friend of mine, with a man to sweep the chimneys, and after waiting above an hour in a cold morning, the housekeeper came down quite in a rage, that we should presume to ring the bell or knock at the door; and when we got admittance, she swore she wished the machine and the inventor at the devil; she did not know me. We swept all the chimneys, and when we had done I asked her what objection she had to it now; she said, a very serious one, that if there was a thing by which a servant could get any emolument, some d——d invention was sure to take it away from them, for that she received perquisites."

This avowal of Mr. Burke's housekeeper, as brusque as it was honest, is typical of the feelings of the whole class of servants.

The opposition in Parliament, as I have intimated, continued. One noble lord informed the House of Peers that he had been indisposed of late and had sought the aid of calomel, the curative influence of which had pervaded every portion of his frame; and that it as far surpassed the less searching powers of other medicines, as the brush of the climbing boy in cleansing every nook and corner of the chimney, surpassed all the power of the machinery, which left the soot unpurged from those nooks and corners.

The House of Commons, however, had expressed its conviction that as long as master chimney-sweepers were permitted to employ climbing boys, the natural result of that permission would be the continuance of those miseries which the Legislature had sought, but which it had failed, to put an end to; and they therefore recommended that the use of climbing boys should be prohibited altogether; and that the age at which the apprenticeship should commence should be extended from eight to fourteen, putting this trade upon the same footing as others which took apprentices at that age.

This resolution became law in 1829. The employment of climbing boys in any manner in the interior of chimneys was prohibited under penalties of fine and imprisonment; and it was enacted that the new measure should be carried into effect in three years, so giving the master sweepers that period of time to complete their arrangements. During the course of the experiments and inquiry, the sweepers, as a body, seem to have thrown no obstacles, or very few and slight obstacles, in the way of the "Committee to promote the Superseding of the Labour of Climbing Boys;" while the most respectable of the class, or the majority of the respectable, aided the efforts of the Committee.

This manifestation of public feeling probably modified the opposition of the sweepers, and unquestionably influenced the votes of members of Parliament. The change in the operations of the chimney-sweeping business took place in 1832, as quietly and unnoticedly as if it were no change at all.

The machine now in use differs little from that invented by Mr. Smart, the first introduced, but lighter materials are now used in its manufacture. It has not been found necessary, however, to complicate its use with the jack-chain and pulley, and bullet with a brush attached, and the iron shutters or registers in the roof or cockloft, of which Mr. Tooke spoke.

The machine is formed of a series of hollow rods, made of a supple cane, bending and not breaking in any sinuosity of the flues. This cane is made of the same material as gentlemen's walking-sticks. The first machines were made of wood, and were liable to be broken; and to enable the sweeps on such occasions to recover the broken part, a strong line ran from bottom to top through the centre of the sticks, which were bored for the purpose, and strung on this cord. The cane machine, however, speedily and effectually superseded these imperfect instruments; and there are now none of them to be met with. To

the top tube of the machine is attached the "brush," called technically "the head," of elastic whalebone spikes, which "give" and bend, in accordance with the up or down motion communicated by the man working the machine, so sweeping what was described to me as "both ways," up and down.

Some of these rods, which fit into one another by means of brass screws, are 4 feet 6 inches long, and diminish in diameter to suit their adjustment. Some rods are but 3 feet 6 inches long, and 4 feet is the full average length; while the average price at the machine maker's is 2*s.* 6*d.* a rod, if bought separately. The head costs 10*s.*, on an average, if bought separately. It is seldom that a machine is required to number beyond 17 rods (extending 68 feet), and the better class of sweepers are generally provided with 17 rods. The cost of the entire machine, for every kind of chimney-work, when purchased new, as a whole, is, when of good quality, from 30*s.* to 5*l.*, according to the number of rods, duplicate rods, &c. Mr. Smart stated, in 1817, that the average price of one of his machines was then 2*l.* 3*s.*

The sweepers who labour chiefly in the poorer localities—and several told me how indifferent many people in those parts were as to their chimneys being swept at all—rarely use a machine to extend beyond 40 feet, or one composed of 10 or 11 rods; but some of the inferior class of sweepers buy of those in a superior way of trade worn machines, at from a third to a half of the prime cost. These machines they trim up themselves. One portion of the work, however, they cannot repair or renew—the broken or worn-out brass screws of the rods, which they call the "ferules." These, when new, are 1*s.* each. There were, when the machine-work was novel, I was informed, street-artizans who went about repairing these screws or ferules; but their work did not please the chimney-sweepers, and this street-trade did not last above a year or two.

The rods of the machine, when carefully attended to, last a long time. One man told me that he was still working some rods which he had worked since 1842 (nine years), with occasional renewal of the ferules. The head is either injured or worn down in about two years; if not well made at first, in a year. The diameter of this head or brush is, on the average, 18 inches. One of my informants had himself swept a chimney of 80 feet, and one of his fellow-workers had said that he once swept a chimney of 120 feet high; in both cases by means of the machine. My informant, however, thought such a feat as the 120-feet sweep was hardly possible, as only one man's strength can be applied to the machine; and he was of opinion that no man's muscular powers would be sufficient to work a machine at a height of 120 feet. The labour is sometimes very severe; "enough," one strongly-built man told me, "to make your arms, head, and heart ache."

The old-fashioned chimneys are generally 12 by 14 inches in their dimensions in the interior; and for the thorough sweeping of such chimneys—the opinion of all the sweepers I saw according on the subject—a head (it is rarely called brush in the trade) of 18 inches diameter is insufficient, yet they are seldom used larger. One intelligent master sweeper, speaking from his own knowledge, told me that in the neighbourhood where he worked numbers of houses had been built since the introduction of the machines, and the chimneys were only 9 inches square, as regards the interior; the smaller flues are sometimes but 7. These 9-inch chimneys, he told me, were frequent in "scamped" houses, houses got up at the lowest possible rate by speculating builders. This was done because the brickwork of the chimneys costs more than the other portions of the masonry, and so the smaller the dimensions of the chimneys the less the cost of the edifice. The machines are sometimes as much crippled in this circumscribed space as they are found of insufficient dimensions in the old-fashioned chimneys; and so the "scamped" chimney, unless by a master having many "heads," is not so cleanly swept as it might be. Chimneys not built in this manner are now usually 9 inches by 14.

In cleansing a chimney with the machine the sweep stands by, or rather in, the fire-place, having first attached a sort of curtain to the mantle to confine the soot to one spot, the operator standing inside this curtain. He first introduces the "head," attached to its proper rod, into the chimney, "driving" it forward, then screws on the next rod, and so on, until the head has been driven to the top of the chimney. The soot which has fallen upon the hearth, within the curtain, is collected into a sack or sacks, and is carried away on the men's backs, and occasionally in carts. The whalebone spikes of the head are made to extend in every direction, so that when it is moved no part of the chimney, if the surface be even, escapes contact with these spikes, if the work be carefully done, as indeed it generally is; for the cleaner the chimney is swept of course the greater amount of soot adds to the profit of the sweeper. One man told me that he thought he had seen in some old big chimneys, a long time unswept, more soot brought down by the machine than, under similar circumstances as to the time the chimney had remained uncleansed, would have been done by the climbing boy.

All the master sweepers I saw concurred in the opinion that the machine was *not* in all respects so effective a sweeper as the climbing boy, as it does not reach the recesses, nooks, crannies, or holes in the chimney, where the soot remains little disturbed by the present process. This want is felt the most in the cleansing of the old-fashioned chimneys, especially in the country.

Mr. Cook, in 1817, stated to the Committee that the cleansing of a chimney by a boy or by a machine occupied the same space of time; but I find the general opinion of the sweepers now to be that it is only the small and straight chimneys which can be swept with as great celerity by a machine as by a climber; in all others the lad was quicker by about 5 minutes in 30, or in that proportion.

I heard sweepers represent that the passing of the Act of Parliament not only deprived them in many instances of the unexpired term of a boy's apprenticeship in his services as a climber, but "threw open the business to any one." The business, however, it seems, was always "open to any one." There was no art nor mystery in it, as regarded the functions of the master; any one could send a boy up a chimney, and collect and carry away the soot he brought down, quite as readily and far more easily than he can work a machine. Nevertheless, men under the old system could hardly (and some say they were forbidden to) embark in this trade unless they had been apprenticed to it; for they were at a loss how to possess themselves of climbing boys, and how to make a connection. When the machines were introduced, however, a good many persons who were able to "raise the price" of one started in the line on their own account. These men have been called by the old hands "leeks" or "green 'uns," to distinguish them from the regularly-trained men, who pride themselves not a little on the fact of their having served seven or eight years, "duly and truly," as they never fail to express it. This increase of fresh hands tended to lower the earnings of the class; and some masters, who were described to me as formerly very "comfortable," and some, comparatively speaking, rich, were considerably reduced by it. The number of "leeks" in 1832 I heard stated, with the exaggeration to which I have been accustomed when uninformed men, ignorant of the relative value of numbers, have expressed their opinions, as 1000!

The several classes in the chimney-sweeping trade may be arranged as follows:—

The *Master Chimney-Sweepers*, called sometimes "Governors" by the journeymen, are divisible into three kinds:—

The "large" or "high masters," who employ from 2 to 10 men and 2 boys, and keep sometimes 2 horses and a cart, not particularly for the conveyance of the soot, but to go into the country to a gentleman's house to fulfil orders.

The "small" or "low masters," who employ, on an average, two men, and sometimes but one man and a boy, without either horse or cart.

The "single-handed master-men," who employ neither men nor boys, but do all the work themselves.

Of these three classes of masters there are two subdivisions.

The "leeks" or "green-uns," that is to say, those who have not regularly served their time to the trade.

The "knullers" or "queriers," that is to say, those who solicit custom in an irregular manner, by knocking at the doors of houses and such like.

Of the competition of capitalists in this trade there are, I am told, no instances. "We have our own stations," one master sweeper said, "and if I contract to sweep a genelman's house, here in Pancras, for 25*s.* a year, or 10*s.*, or anythink, my nearest neighbour, as has men and machines fit, is in Marrybun; and it wouldn't pay to send his men a mile and a half, or on to two mile, and work at what I can—let alone less. No, sir, I 've known bisness nigh 20 year, and there 's nothink in the way of that underworking. The poor creeturs as keeps theirselves with a machine, and nothing to give them a lift beyond it, *they'd* undertake work at any figure, but nobody employs or can trust to them, but on chance." The contracts, I am told, for a year's chimney-sweeping in any mansion are on the same terms with one master as with another.

As regards the *Journeymen Chimney-Sweepers* there are also three kinds:—

The "foreman" or "first journeyman" sweeper, who accompanies the men to their work, superintends their labours, and receives the money, when paid immediately after sweeping.

The "journeyman" sweeper, whose duty it is to work the machine, and (where no under-journeyman, or boy, is kept) to carry the machine and take home the soot.

The "under-journeyman" or "boy," who has to carry the machine, take home the soot, and work the machine up the lower-class flues.

There are, besides these, some 20 climbing men, who ascend such flues as the machines cannot cleanse effectually, and, it must, I regret to say, be added, some 20 to 30 climbing boys, mostly under eleven years of age, who are still used for the same purpose "on the sly." Many of the masters, indeed, lament the change to machine-sweeping, saying that their children, who are now useless, would, in "the good old times," have been worth a pound a week to them. It is in the suburbs that these climbing children are mostly employed.

The *hours of labour* are from the earliest morning till about midday, and sometimes later.

There are *no Houses of Call*, trade societies, or regulations among these operatives, but there are low public-houses to which they resort, and where they can always be heard of.

When a chimney-sweeper is out of work he merely inquires of others in the same line of business, who, if they know of any one that wants a journeyman, direct their brother sweeper to call and see the master; but though the chimney-sweepers have no trade societies, some of the better class belong to sick, and others to burial, funds. The lower class of sweepers, however, seem to have no resource in sickness, or in their utmost need, but the parish. There are sweepers, I am told, in every workhouse in London.

There are three *modes of payment common* among the sweepers:—

1, in money;

2, partly in money and partly in kind; and

3, by perquisites.

The great majority of the masters pay the men they employ from 2*s.* to 3*s.*, and a few 4*s.* and 6*s.* per week, together with their board and lodging. It may seem that 3*s.* per week is a small sum, but it was remarked to me that there are few working men who, after supporting themselves, are able to save that sum weekly, while the sweepers have many perquisites of one sort or

Original from HARVARD UNIVERSITY

other, which sometimes bring them in 1s., 2s., 3s., 4s., and occasionally 5s. or 6s., a week additional —a sufficient sum to pay for clothes and washing. The journeymen, when lodged in the house of the master, are single men, and if constantly employed might, perhaps, do well, but they are often unemployed, especially in the summer, when there are not so many fires kept burning. As soon as one of them gets married, or what among them is synonymous, "takes up with a woman," which they commonly do when they are able to purchase some sort of a machine, they set up for themselves, and thus a great number of the men get to be masters on their own account, without being able to employ any extra hands. These are generally reckoned among the "knullers;" they do but little business at first, for the masters long established in a neighbourhood, who are known to the people, and have some standing, are almost always preferred to those who are strangers or mere beginners.

It was very common, but perhaps more common in country towns than in London, for the journeymen, as well as apprentices, in this and many other trades to live at the master's table. But the board and lodging supplied, in lieu of money-wages, to the journeymen sweepers, seems to be one of the few existing instances of such a practice in London. Among slop-working tailors and shoemakers, some unfortunate workmen are boarded and lodged by their employers, but these employers are merely middlemen, who gain their living by serving such masters as "do not like to drive their negroes themselves." But among the sweepers there are no middlemen.

It is not all the journeymen sweepers, however, who are remunerated after this manner, for many receive 12s., and some 14s., and not a few 18s. weekly, besides perquisites, but reside at their own homes.

Apprenticeship is now not at all common among the sweepers, as no training to the business is needed. Lord Shaftesbury, however, in July last, gave notice of his intention to bring in a bill to prevent persons who had not been duly apprenticed to the business establishing themselves as sweepers.

The Perquisites of the journeymen sweepers are for measuring, arranging, and putting the soot sold into the purchasers' sacks, or carts; for this is considered extra work. The payment of this perquisite seems to be on no fixed scale, some having 1s. for 50, and some for 100 bushels. When a chimney is on fire and a journeyman sweeper is employed to extinguish it, he receives from 1s. 6d. to 5s. according to the extent of time consumed and the risk of being injured. "Chance sweeping," or the sweeping of a chimney not belonging to a customer, when a journeyman has completed his regular round, ensures him 3d. in some employments, but in fewer than was once the case. The beer-money given by any customer to a journeyman is also his perquisite. Where a foreman is kept, the "brieze," or cinders collected from the grate, belong to him, and the ashes belong to the journeyman; but where there is no foreman, the brieze and ashes belong to the journeyman solely. These they sell to the poor at the rate of 6d. a bushel. I am told by experienced men that, all these matters considered, it may be stated that one-half of the journeymen in London have perquisites of 1s. 6d., the other half of 2s. 6d. a week.

The Nominal Wages to the journeymen, then, are from 12s. to 18s. weekly, without board and lodging, or from 2s. to 6s. in money, with board and lodging, represented as equal to 7s.

The Actual Wages are 2s. 6d. a week more in the form of perquisites, and perhaps 4d. daily in beer or gin.

The wages to the boys are mostly 1s. a week, but many masters pay 1s. 6d. to 2s., with board and lodging. These boys have no perquisites, except such bits of broken victuals as are given to them at houses where they go to sweep.

The wages of the foreman are generally 18s. per week, but some receive 14s. and some 20s. without board and lodging. In one case, where the foreman is kept by the master, only 2s. 6d. in money is given to him weekly. The perquisites of these men average from 4s. to 5s. a week.

The work in the chimney-sweeping trade is more regular than might at first be supposed. The sweepers whose circumstances enable them to employ journeymen send them on regular rounds, and do not engage "chance" hands. If business is brisk, the men and the master, when a working man himself, work later than ordinary, and sometimes another hand is put on and paid the customary amount, by the week, until the briskness ceases; but this is a rare occurrence. There are, however, strong lads, or journeymen out of work, who are *occasionally* employed in "*jobbing*," helping to carry the soot and such like.

The labour of the journeymen, as regards the payment by their masters, is *continuous*, but the men are often discharged for drunkenness, or for endeavouring to "form a connection of their own" among their employers' customers, and new hands are then put on. "Chimneys won't wait, you know, sir," was said to me, "and if I quit a hand this week, there's another in his place next. If I discharge a hand for three months in a slack time, I have two on when it's a busy time." Perhaps the average employment of the whole body of operatives may be taken at nine months' work in the year. When out of employment the chief resource of these men is in night-work; some turn street-sellers and bricklayers' labourers.

I am told that a considerable sum of money was left for the purpose of supplying every climbing-boy who called on the first of May at a certain place, with a shilling and some refreshment, but I have not been able to ascertain by whom it was left, or where it was distributed; none of the sweepers with whom I conversed knew anything about it. I also heard, that since the passing of the Act, the money has been invested in some securities or other, and is now accumulating, but to what purpose it is intended to be applied I have no means of learning.

Let us now endeavour to estimate the gross yearly income of the operative sweepers.

Original from HARVARD UNIVERSITY

There are, then, 399 men employed as journeymen, and of them 147 receive a money wage weekly from their masters, and reside with their parents or at their own places. The remaining 252 are boarded and lodged. This board and lodging are generally computed, as under the old system, to represent 8*s.*, being 1*s.* a day for board and 1*s.* a week for lodging. But, on the average, the board does not cost the masters 7*s.* a week, but, as I shall afterwards show, barely 6*s.*

The men and boys may be said to be all fully employed for nine months in the year; some, of course, are at work all the year through, but others get only six months' employment in the twelve months; so that taking nine months as the average, we have the following table of

WAGES PAID TO THE OPERATIVE SWEEPERS OF LONDON.

				Money wages for nine months. £	s.	d.	Value of board and lodging for nine months estimated at 7*s.* a week. £	s.	d.

Thus we find that the *constant* or *average casual* wages of the several classes of operative chimney-sweepers may be taken as follows:—

	s.	d.
Journeymen without board and lodging, and with perquisites averaging 2s. a week	12	6
Journeymen with board and lodging and 2s. a week perquisites	9	10½
Foreman, without board and lodging, at 2s. 6d. a week perquisites	15	7
Boys, with board and lodging	5	3

The *general* wages of the trade, including foreman, journeymen, and boys, and calculating the perquisites to average 2s. weekly, will be 10s. 6d. a week, the same as the cotton factory operatives.

But if 10,500*l.* be the income of the operatives, what do the employers receive who have to pay this sum?

The charge for sweeping one of the lofty chimneys in the public and official edifices, and in the great houses in the aristocratic streets and squares, is 2s. 6d. and 3s. 6d.

The chimneys of moderate-sized houses are swept at 1s. to 1s. 6d. each, and those of the poorer classes are charged generally 6d.; some, however, are swept at 3d. and 4d.; and when soot realized a higher price (some of the present master sweepers *have* sold it at 1s. a bushel), the chimneys of poor persons were swept by the poorer class of sweeps merely for the perquisite of the soot. This is sometimes done even now, but to a very small extent, by a sweeper, "on his own hook," and in want of a job, but generally with an injunction to the person whose chimney has been cleansed on such easy terms, not to mention it, as it "couldn't be made a practice on."

Estimating the number of houses belonging to the wealthy classes of society to be 54,000, and these to be swept eight times a year, and the charge for sweeping to be 2s. 6d. each time; and the number of houses belonging to the middle classes to be 90,000, and each to be swept four times a year, at 1s. 6d. each time; and the dwellings of the poor and labouring classes to be swept once a year at 6d. each time, and the number of such dwellings to be 165,000, we find that the total sum paid to the master chimney-sweepers of London is, in round numbers, 85,000*l.*

The sum obtained for 800,000 bushels of soot collected by the master-sweepers from the houses of London, at 5d. per bushel, is 16,500*l.*

Thus the total annual income of the master-sweepers of London is 100,000*l.*

Out of this 100,000*l.* per annum, the expenses of the masters would appear to be as follows:—

Yearly Expenditure of the Master-Sweepers.

Sum paid in wages to 473 journeymen	£10,500
Rent, &c., of 350 houses or lodgings, at 12*l.* yearly each	4,200
Wear and tear of 1000 machines, 1*l.* each yearly	1,000
Ditto 2000 sacks, at 1s. each yearly	100
Keep of 25 horses, 7s. weekly each	£455
Wear and tear of 25 carts and harness, 1*l.* each	25
Interest on capital at 10 per cent.	450
Total yearly expenditure of master-sweepers employing journeymen	£16,736

The rent here given may seem low at 12*l.* a year, but many of the chimney-sweepers live in parlours, with cellars below, in old out-of-the-way places, at a low rental, in Stepney, Shadwell, Wapping, Bethnal-green, Hoxton, Lock's-fields, Walworth, Newington, Islington, Somers-town, Paddington, &c. The better sort of master-sweepers at the West-end often live in a mews.

The gains, then, of the master sweepers are as under:—

Annual income for cleansing chimneys and soot	£100,000
Expenditure for wages, rent, wear, and tear, keep of horses, &c., say	20,000
Annual profit of master chimney-sweepers of London	£80,000

This amount of profit, divided among 350 masters, gives about 230*l.* per annum to each individual; it is only by a few, however, that such a sum is realized, as in the 100,000*l.* paid by the London public to the sweepers' trade, is included the sum received by the men who work single-handed, "on their own hook," as they say, employing no journeymen. Of these men's earnings, the accounts I heard from themselves and the other master sweepers were all accordant, that they barely made journeymen's wages. They have the very worst-paid portion of the trade, receiving neither for their sweeping nor their soot the prices obtained by the better masters; indeed they very frequently sell their soot to their more prosperous brethren. Their general statement is, that they make "eighteen pence a day, and all told." Their receipts then, and they have no perquisites as have the journeymen, are, in a slack time, about 1s. a day (and some days they do not get a job); but in the winter they are busier, as it is then that sweepers are employed by the poor; and at that period the "master-men" may make from 15s. to 20s. a week each; so that, I am assured, the average of their weekly takings may be estimated at 12s. 6d.

Now, deducting the expenditure from the receipts of 100,000*l.* (for sweeping and soot), the balance, as we have seen, is 80,000*l.*, an amount of profit which, if equally divided among the three classes of the trade, will give the following sums:—

	Yearly, each. £	s.	Yearly, total. £
Profits of 150 single-handed master-men	32	10	4,940
Do. 92 small masters	200	0	18,400
Do. 106 large masters	500	0	53,000
			£76,340

Nor is this estimate of the masters' profits, I

Original from HARVARD UNIVERSITY

am assured, extravagant. One of the smaller sweepers, but a prosperous man in his way, told me that he knew a master sweeper who was "as rich as Crœser, had bought houses, and could not write his own name."

We have now but to estimate the amount of capital invested in the chimney-sweepers' trade, and then to proceed to the characteristics of the men.

	£
1200 machines, 2*l*. 10*s*. each (present average value)	3000
3000 sacks, 2*s*. 6*d*. each	385
25 horses, 20*l*. each	500
25 sets of harness, 2*l*. each	50
25 carts, 12*l*. each	300
	£4235

It may be thought that the sweepers will require the services of more than 25 horses, but I am assured that such is not the case as regards the soot business, for the soot is carted away from the sweepers' premises by the farmer or other purchaser.

It would appear, then, that the facts of the chimney-sweepers' trade are briefly as under:—

The gross quantity of soot collected yearly throughout London is 800,000 bushels. The value of this, sold as manure, at 5*d*. per bushel, is 16,500*l*.

There are 800 to 900 people employed in the trade, 200 of whom are masters employing journeymen, 150 single-handed master-men, and 470 journeymen and under journeymen.

The annual income of the entire number of journeymen is 10,500*l*. without perquisites, or 13,000*l*. with, which gives an average weekly wage to the operatives of 10*s*. 6*d*.

The annual income of the masters and leeks is, for sweeping and soot, 100,000*l*.

The annual expenditure of the masters for rent, keep of horses, wear and tear, and wages, is 20,000*l*.

The gross annual profit of the 350 masters is 80,000*l*., which is at the rate of about 35*l*. per annum to each of the single-handed men, 200*l*. to each of the smaller masters employing journeymen, and 500*l*. to each of the larger masters.

The capital of the trade is about 5000*l*.

The price charged by the "high master sweepers" for cleaning the flues of a house rented at 150*l*. a year and upwards, is from 1*s*. to 3*s*. 6*d*. (the higher price being paid for sweeping those chimneys which have a hot plate affixed). A small master, on the other hand, will charge from 1*s*. to 3*s*. for the same kind of work, while a single-handed man seldom gets above "a 2*s*. job," and that not very often. The charge for sweeping the flues of a house rented at from 50*l*. to 150*l*. a year, is from 9*d*. to 2*s*. 6*d*. by a large master, and from 8*d*. to 2*s*. by a small master, while a single-handed man will take the job at from 6*d*. to 1*s*. 6*d*. The price charged per flue for a house rented at from 20*l*. a year up to 50*l*. a year, will average 6*d*. a flue, charged by large masters, 4*d*. by small masters, and from 2*d*. to 3*d*. by the single-handed sweepers in some cases; indeed, the poorest class will sweep a flue for the soot only. But the prices charged for sweeping chimneys differ in the different parts of the metropolis. I subjoin a list of the maximum and minimum charge for the several districts.

N.B.—The single-handed and the knullers generally charge a penny less than the prices above given.

There are three different kinds of soot:—the best is produced purely from coal; the next in value is that which proceeds from the combustion of vegetable refuse along with the coal, as in cases where potato peelings, cabbage leaves, and the like, are burnt in the fires of the poorer classes; while the soot produced from wood fires is, I am told, scarcely worth carriage. Wood-soot, however, is generally mixed with that from coal, and sold as the superior kind.

Not only is there a difference in value in the various kinds of soot, but there is also a vast difference in the weight. A bushel of pure coal soot will not weigh above four pounds; that produced from the combustion of coal and vegetable refuse will weigh nearly thrice as much; while that from wood fires is, I am assured, nearly ten times heavier than from coal.

I have not heard that the introduction of free trade has had any influence on the value of soot, or in reducing the wages of the operatives. The same wages are paid to the operatives whether soot sells at a high or low price.

Of the General Characteristics of the Working Chimney-Sweepers.

There are many reasons why the chimney-sweepers have ever been a distinct and peculiar class. They have long been looked down upon as the lowest order of workers, and treated with contumely by those who were but little better than themselves. The peculiar nature of their work giving them not only a filthy appearance, but an offensive smell, of itself, in a manner, prohibited them from associating with other working men; and the natural effect of such proscrip-

NOTE.—*b* means board and lodging as well as money, or part money and part kind; *e* stands for everything found or paid all in kind.

These returns have been collected by personal visits to each district:—the name of each master throughout London, together with the number of Foremen, Journeymen, and Under Journeymen employed, and the Wages received by each, as well as the quantity of soot collected, have been likewise obtained; but the names of the masters are here omitted for want of space, and the results alone are given.

tion has been to compel them to herd together apart from others, and to acquire habits and peculiarities of their own widely differing from the characteristics of the rest of the labouring classes.

Sweepers, however, have not from this cause generally been an hereditary race—that is, they have not become sweepers from father to son for many generations. Their numbers were, in the days of the climbing boys, in most intances increased by parish apprentices, the parishes usually adopting that mode as the cheapest and easiest of freeing themselves from a part of the burden of juvenile pauperism. The climbing boys, but more especially the unfortunate parish apprentices, were almost always cruelly used, starved, beaten, and over-worked by their masters, and treated as outcasts by all with whom they came in contact: there can be no wonder, then, that, driven in this manner from all other society, they gladly availed themselves of the companionship of their fellow-sufferers; quickly imbibed all their habits and peculiarities; and, perhaps, ended by becoming themselves the most tyrannical masters to those who might happen to be placed under their charge.

Notwithstanding the disrepute in which sweepers have ever been held, there are many classes of workers beneath them in intelligence. All the tribe of finders and collectors (with the exception of the dredgermen, who are an observant race, and the sewer-hunters, who, from the danger of their employment, are compelled to exercise their intellects) are far inferior to them in this respect; and they are clever fellows compared to many of the dustmen and scavagers. The great mass of the agricultural labourers are known to be almost as ignorant as the beasts they drive; but the sweepers, from whatever cause it may arise, are known, in many instances, to be shrewd, intelligent, and active.

But there is much room for improvement among the operative chimney-sweepers. Speaking of the men generally, I am assured that there is scarcely one out of ten who can either read or write. One man in Chelsea informed me that some ladies, in connection with the Rev. Mr. Cadman's church, made an attempt to instruct the sweepers of the neighbourhood in reading and writing; but the master sweepers grew jealous, and became afraid lest their men should get too knowing for them. When the time came, therefore, for the men to prepare for the school, the masters always managed to find out some job which prevented them from attending at the appointed time, and the consequence was that the benevolent designs of the ladies were frustrated.

The sweepers, as a class, in almost all their habits, bear a strong resemblance to the costermongers. The habit of going about in search of their employment has, of itself, implanted in many of them the wandering propensity peculiar to street people. Many of the better-class costermongers have risen into coal-shed men and greengrocers, and become settled in life; in like manner the better-class sweepers have risen to be masters, and, becoming settled in a locality, have gradually obtained the trade of the neighbourhood; then, as their circumstances improved, they have been able to get horses and carts, and become nightmen; and there are many of them at this moment men of wealth, comparatively speaking. The great body of them, however, retain in all their force their original characteristics; the masters themselves, although shrewd and sensible men, often betray their want of education, and are in no way particular as to their expressions, their language being made up, in a great measure, of the terms peculiar to the costermongers, especially the denominations of the various sorts of money. I met with some sweepers, however, whose language was that in ordinary use, and their manners not vulgar. I might specify one, who, although a workhouse orphan and apprentice, a harshly-treated climbing-boy, is now prospering as a sweeper and nightman, is a regular attendant at all meetings to promote the good of the poor, and a zealous ragged-school teacher, and teetotaller.

When such men are met with, perhaps the class cannot be looked upon as utterly cast away, although the need of reformation in the habits of the working sweepers is extreme, and especially in respect of drinking, gambling, and dirt. The journeymen (who have often a good deal of leisure) and the single-handed men are—in the great majority of cases at least—addicted to drinking, beer being their favourite beverage, either because it is the cheapest or that they fancy it the most suitable for washing away the sooty particles which find their way to their throats. These men gamble also, but with this proviso—they seldom play for money; but when they meet in their usual houses of resort—two famous ones are in Back C—— lane and S—— street, Whitechapel—they spend their time and what money they may have in tossing for beer, till they are either drunk or penniless. Such men present the appearance of having just come out of a chimney. There seems never to have been any attempt made by them to wash the soot off their faces. I am informed that there is scarcely one of them who has a second shirt or any change of clothes, and that they wear their garments night and day till they literally rot, and drop in fragments from their backs. Those who are not employed as journeymen by the masters are frequently whole days without food, especially in summer, when the work is slack; and it usually happens that those who are what is called "knocking about on their own account" seldom or never have a farthing in their pockets in the morning, and may, perhaps, have to travel till evening before they get a threepenny or sixpenny chimney to sweep. When night comes, and they meet their companions, the tossing and drinking again commences; they again get drunk; roll home to wherever it may be, to go through the same routine on the morrow; and this is the usual tenour of their lives, whether earning 5*s*. or 20*s*. a week.

The chimney-sweepers generally are fond of drink; indeed their calling, like that of dustmen, is one of those which naturally lead to it. The

men declare they are ordered to drink gin and smoke as much as they can, in order to rid the stomach of the soot they may have swallowed during their work.

Washing among chimney-sweepers seems to be much more frequent than it was. In the evidence before Parliament it was stated that some of the climbing-boys were washed once in six months, some once a week, some once in two or three months. I do not find it anywhere stated that any of these children were never washed at all; but from the tenour of the evidence it may be reasonably concluded that such was the case.

A master sweeper, who was in the habit of bathing at the Marylebone baths once and sometimes twice a week, assured me that, although many now eat and drink and sleep sooty, washing is more common among his class than when he himself was a climbing-boy. He used then to be stripped, and compelled to step into a tub, and into water sometimes too hot and sometimes too cold, while his mistress, to use his own word, *scoured* him. Judging from what he had seen and heard, my informant was satisfied that, from 30 to 40 years ago, climbing-boys, with a very few exceptions, were but seldom washed; and then it was looked upon by them as a most disagreeable operation, often, indeed, as a species of punishment. Some of the climbing-boys used to be taken by their masters to bathe in the Serpentine many years ago; but one boy was unfortunately drowned, so that the children could hardly be coerced to go into the water afterwards.

The washing among the chimney-sweepers of the present day, when there are scarcely any climbing-boys, is so much an individual matter that it is not possible to speak with any great degree of certainty on the subject, but that it increases may be concluded from the fact that the number of sweeps who resort to the public baths increases.

The first public baths and washhouses opened in London were in the "north-west district," and situated in George-street, Euston-square, near the Hampstead-road. This establishment was founded by voluntary contribution in 1846, and is now self-supporting.

There are three more public baths: one in Goulston-street, Whitechapel (on the same principle as that first established); another in St. Martin's, near the National Gallery, which are parochial; and the last in Marylebone, near the Yorkshire Stingo tavern, New-road, also parochial. The charge for a cold bath, each being secluded from the others, is 1*d.*, with the use of a towel; a warm bath is 2*d.* in the third class. The following is the return of the number of bathers at the north-west district baths, the establishment most frequented:—

	1847.	1848.	1849.	1850.
Bathers	110,940	111,788	96,726	86,597
Washers, Dryers, Ironers, &c.	39,418	61,690	65,934	73,023
Individuals Washed for	137,672	246,760	263,736	292,092

I endeavoured to ascertain the proportion of sweepers, with other working men, who availed themselves of these baths; but there are unfortunately no data for instituting a comparison as to the relative cleanliness of the several trades. When the baths were first opened an endeavour was made to obtain such a return; but it was found to be distasteful to the bathers, and so was discontinued. We find, then, that in four years there have been 406,051 bathers. The following gives the proportion between the sexes, a portion of 1846 being included:—

Bathers—Males	417,424
" Females	47,114
Total bathers	464,538

The falling off in the number of bathers at this establishment is, I am told, attributable to the opening of new baths, the people, of course, resorting to the nearest.

I have given the return of washers, &c., as I endeavoured to ascertain the proportion of washing by the chimney-sweeper's wives; but there is no specification of the trades of the persons using this branch of the establishment any more than there is of those frequenting the baths, and for the same reason as prevented its being done among the bathers. One of the attendants at these washhouses told me that he had no doubt the sweepers' wives did wash there, for he had more than once seen a sweeper waiting to carry home the clothes his wife had cleansed. As no questions concerning their situation in life are asked of the poor women who resort to these very excellent institutions (for such they appear to be on a cursory glance) of course no data can be supplied. This is to be somewhat regretted; but a regard to the feelings, and in some respects to the small prejudices, of the industrious poor is to be commended rather than otherwise, and the managers of these baths certainly seem to have manifested such a regard.

I am informed, however, by the secretary of the north-west district institution, that in some weeks of the summer 80 chimney-sweepers bathed there; always having, he believed, warm baths, which are more effective in removing soot or dirt from the skin than cold. Summer, it must be remembered, is the sweep's "brisk" season. In a winter week as few as 25 or 20 have bathed, but the weekly average of sweeper-bathers, the year through, is about 50; and the number of sweeper-bathers, he thought, had increased since the opening of the baths about 10 per cent. yearly. As in 1850 the average number of bathers of all classes did not exceed 1646 per week, the proportion of sweepers, 50, is high. The number of female bathers is about one-ninth, so that the males would be about 1480; and the 50 sweepers a week constitute about a thirtieth part of the whole of the third-class bathers. The number of sweep-bathers was known because a sweep is known by his appearance.

I was told by the secretary that the sweepers, the majority bathing on Saturday nights, usually

Original from HARVARD UNIVERSITY

carried a bundle to the bath; this contained their "clean things." After bathing they assumed their "Sunday clothes;" and from the change in their appearance between ingress and egress, they were hardly recognisable as the same individuals.

In the other baths, where also there is no specification of the bathers, I am told, that of sweepers bathing the number (on computation) is 30 at Marylebone, 25 at Goulston-street, and 15 (at the least) at St. Martin's, as a weekly average. In all, 120 sweepers bathe weekly, or about a seventh of the entire working body. The increase at the three baths last mentioned, in sweepers bathing, is from 5 to 10 per cent.

Among the lower-class sweepers there are but few who wash themselves even once throughout the year. They eat, drink, and sleep in the same state of filth and dirt as when engaged in their daily avocation. Others, however, among the better class are more cleanly in their habits, and wash themselves every night.

Between *the appearance of the sweepers* in the streets at the present time and before the abolition of the system of climbing there is a marked difference. Charles Lamb said (in 1823):—

"I like to meet a sweep—understand me, not a grown sweeper—old chimney-sweepers are by no means attractive—but one of those tender novices blooming through their first nigritude, the maternal washings not quite effaced from the cheek—such as come forth with the dawn, or somewhat earlier, with their little professional notes sounding like the *peep peep* of a young sparrow; or liker to the matin lark should I pronounce them, in their aerial ascents not seldom anticipating the sunrise?"

Throughout his essay, Elia throws the halo of poetry over the child-sweepers, calling them "dim specks," "poor blots," "innocent blacknesses," "young Africans of our own growth;" the natural kindliness of the writer shines out through all. He counsels his reader to give the young innocent 2*d*., or, if the weather were starving, "let the demand on thy humanity rise to a tester" (6*d*.).

The appearance of the little children-sweepers, as they trotted along at the master's or the journeyman's heels, or waited at "rich men's doors" on a cold morning, was pitiable in the extreme. If it snowed, there was a strange contrast between the black sootiness of the sweeper's dress and the white flakes of snow which adhered to it. The boy-sweeper trotted listlessly along; a sack to contain the soot thrown over his shoulder, or disposed round his neck, like a cape or shawl. One master sweeper tells me that in his apprenticeship days he had to wait at the great mansions in and about Grosvenor-square, on some bitter wintry mornings, until he felt as if his feet, although he had both stockings and shoes—and many young climbers were barefoot—felt as if frozen to the pavement. When the door was opened, he told me, the matter was not really mended. The rooms were often large and cold, and being lighted only with a candle or two, no doubt looked very dreary, while there was not a fire in the whole house, and no one up but a yawning servant or two, often very cross at having been disturbed. The servants, however, in noblemen's houses, he also told me, were frequently kind to him, giving him bread and butter, and sometimes bread and jam; and as his master generally had a glass of raw spirit handed to him, the boy usually had a sip when his employer had "knocked off his glass." His employer, indeed, sometimes said, "O, *he's* better without it; it'll only larn him to drink, like it did me;" but the servant usually answered, "O, here, just a thimblefull for him."

The usual dress of the climbing-boy—as I have learned from those who had worn it themselves, and, when masters, had provided it for their boys—was made of a sort of strong flannel, which many years ago was called chimney-sweepers' cloth; but my informant was not certain whether this was a common name for it or not, he only remembered having heard it called so. He remembered, also, accompanying his master to do something to the flues in a church, then (1817) hung with black cloth, as a part of the national mourning for the Princess Charlotte of Wales, and he thought it seemed very like the chimney-sweepers' cloth, which was dark coloured when new. The child-sweep wore a pair of cloth trowsers, and over that a sort of tunic, or tight fitting shirt with sleeves; sometimes a little waistcoat and jacket. This, it must be borne in mind, was only the practice among the best masters (who always had to find their apprentices in clothes); and was the practice among them more and more in the later period of the climbing process, for householders began to inquire as to what sort of trim the boys employed on their premises appeared in. The poorer or the less well-disposed masters clad the urchins who climbed for them in any old rags which their wives could piece together, or in any low-priced garment "picked up" in such places as Rosemary-lane. The fit was no object at all. These ill-clad lads were, moreover, at one time the great majority. The clothes were usually made "at home" by the women, and in the same style, as regarded the seams, &c., as the sacks for soot; but sometimes the work was beyond the art of the sweeper's wife, and then the aid of some poor neighbour better skilled in the use of her scissors and needle, or of some poor tailor, was called in, on the well-known terms of "a shilling (or 1*s*. 6*d*.) a day, and the grub."

The cost of a climbing-boy's dress, I was informed, varied, when new, according to the material of which it was made, from 3*s*. 6*d*. to 6*s*. 6*d*. independently of the cost of making, which, in the hands of a tailor who "whipped the cat" (or went out to work at his customer's houses), would occupy a day, at easy labour, at a cost of 1*s*. 6*d*. (or less) in money, and the "whip-cat's" meals, perhaps another 1*s*. 6*d*., beer included. As to the cost of a sweeper's second-hand clothing it is useless to inquire; but I was informed by a now

thriving master, that when he was about twelve years old his mistress bought him a "werry tidy jacket, as seemed made for a gen'leman's son," in Petticoat-lane, one Sunday morning, for 1*s.* 6*d.*; while other things, he said, were "in proportionate." Shoes and stockings are not included in the cost of the little sweeper's apparel; and they were, perhaps, always bought second-hand. A few of the best masters (or of those wishing to stand best in their customers' regards), who sent their boys to church or to Sunday schools, had then a non-working attire for them; either a sweeper's dress of jacket and trowsers, unsoiled by soot, or the ordinary dress of a poor lad.

The street appearance of the present race of sweepers, all adults, may every here and there bear out Charles Lamb's dictum, that grown sweepers are by no means attractive. Some of them are bread-shouldered and strongly-built men, who, as they traverse the streets, sometimes look as grim as they are dingy. The chimney-scavager carries the implement of his calling propped on his shoulder, in the way shown in the daguerreotype which I have given. His dress is usually a jacket, waistcoat, and trowsers of dark-coloured corduroy; or instead of a jacket a waistcoat with sleeves. Over this when at work the sweeper often wears a sort of blouse or short smock-frock of coarse strong calico or canvas, which protects the corduroy suit from the soot. In this description of the sweeper's garb I can but speak of those whose means enable them to attain the comfort of warm apparel in the winter; the poorer part of the trade often shiver shirtless under a blouse which half covers a pair of threadbare trowsers. The cost of the corduroy suit I have mentioned varies, I was told by a sweeper, who put it tersely enough, "from 20*s.* *slop*, to 40*s.* *slap*." The average runs, I believe, from 28*s.* to 30*s.*, as regards the better class of the sweepers.

The *diet of the journeymen sweepers and the apprentices*, and sometimes of their working employer, was described to me as generally after the following fashion. My informant, a journeyman, calculated what his food "stood his master," as he had once "kept hisself."

	Daily. *s.*	*d.*
Bread and butter and coffee for breakfast	0	2
A saveloy and potatoes, or cabbage; or a "fagot," with the same vegetables; or fried fish (but not often); or pudding, from a pudding-shop; or soup (a twopenny plate) from a cheap eating-house; average from 2*d.* to 3*d.*	0	2½
Tea, same as breakfast	0	2
	0	6½

On Sundays the fare was better. They then sometimes had a bit of "prime fat mutton" taken to the oven, with "taturs to bake along with it;" or a "fry of liver, if the old 'oman was in a good humour," and always a pint of beer apiece. Hence, as some give their men beer, the average amount of 5*s.* or 6*s.* weekly, which I have given as the cost of the "board" to the masters, is made up. The drunken single-handed master-men, I am told, live on beer and "a bite of anything they can get." I believe there are few complaints of inefficient food.

The food provided by the large or high master sweepers is generally of the same kind as the master and his family partake of; among this class the journeymen are tolerably well provided for.

In the lower-class sweepers, however, the food is not so plentiful nor so good in kind as that provided by the high master sweepers. The expense of keeping a man employed by a large master sometimes ranges as high as 8*s.* a week, but the average, I am told, is about 6*s.* per week; while those employed by the low-class sweepers average about 5*s.* a week. The cost of their lodging may be taken at from 1*s.* to 2*s.* a week extra.

The sweepers in general are, I am assured, fond of oleaginous food; fat broth, fagots, and what is often called "greasy" meat.

They are considered *a short-lived people*, and among the journeymen, the masters "on their own hook," &c., few old men are to be met with. In one of the reports of the Board of Health, out of 4312 deaths among males, of the age of 15 and upwards, the mortality among the sweepers, masters and men, was 9, or one in 109 of the whole trade. As the calculation was formed, however, from data supplied by the census of 1841, and on the Post Office Directory, it supplies no reliable information, as I shall show when I come to treat of the nightmen. Many of these men still suffer, I am told, from the chimney-sweeper's cancer, which is said to arise mainly from uncleanly habits. Some sweepers assure me that they have vomited balls of soot.

As to the abodes of the master sweepers, I can supply the following account of two. The soot, I should observe, is seldom kept long, rarely a month, on the premises of a sweeper, and is in the best "concerns" kept in cellars.

The localities in which many of the sweepers reside are the "lowest" places in the district. Many of the houses in which I found the lower class of sweepers were in a ruinous and filthy condition. The "high-class" sweepers, on the other hand, live in respectable localities, often having back premises sufficiently large to stow away their soot.

I had occasion to visit the house of one of the persons from whom I obtained much information. He is a master in a small way, a sensible man, and was one of the few who are teetotallers. His habitation, though small—being a low house only one story high—was substantially furnished with massive mahogany chairs, table, chests of drawers, &c., while on each side of the fire-place, which was distinctly visible from the street over a hall door, were two buffets, with glass doors, well filled with glass and china vessels. It was a wet night, and a fire burned brightly in the stove, by the light of which might be seen the master of the establishment sitting on one side, while his

wife and daughter occupied the other; a neighbour sat before the fire with his back to the door, and altogether it struck me as a comfortable-looking evening party. They were resting and chatting quietly together after the labour of the day, and everything betokened the comfortable circumstances in which the man, by sobriety and industry, had been able to place himself. Yet this man had been a climbing-boy, and one of the unfortunates who had lost his parents when a child, and was apprenticed by the parish to this business. From him I learned that his was not a solitary instance of teetotalism (I have before spoken of another); that, in fact, there were some more, and one in particular, named Brown, who was a good speaker, and devoted himself during his leisure hours at night in advocating the principles which by experience he had found to effect such great good to himself; but he also informed me that the majority of the others were a drunken and dissipated crew, sunk to the lowest degree of misery, yet recklessly spending every farthing they could earn in the public-house.

Different in every respect was another house which I visited in the course of my inquiries, in the neighbourhood of H—-street, Bethnal-green. The house was rented by a sweeper, a master on his own account, and every room in the place was let to sweepers and their wives or women, which, with these men, often signify one and the same thing. The inside of the house looked as dark as a coal-pit; there was an insufferable smell of soot, always offensive to those unaccustomed to it; and every person and every thing which met the eye, even to the caps and gowns of the women, seemed as if they had just been steeped in Indian ink. In one room was a sweep and his woman quarrelling. As I opened the door I caught the words, "I'm d——d if I has it any longer. I'd see you b——y well d——d first, and you knows it." The savage was intoxicated, for his red eyes flashed through his sooty mask with drunken excitement, and his matted hair, which looked as if it had never known a comb, stood out from his head like the whalebone ribs of his own machine. "B——y Bet," as he called her, did not seem a whit more sober than her man; and the shrill treble of her voice was distinctly audible till I turned the corner of the street, whither I was accompanied by the master of the house, to whom I had been recommended by one of the fraternity as an intelligent man, and one who knew "a thing or two." "You see," he said, as we turned the corner, "there isn't no use a talkin' to them ere fellows—they're all tosticated now, and they doesn't care nothink for nobody; but they'll be quiet enough to-morrow, 'cept they yarns somethink, and if they do then they'll be just as bad to-morrow night. They're a awful lot, and nobody ill niver do anythink with them." This man was not by any means in such easy circumstances as the master first mentioned. He was merely a man working for himself, and unable to employ any one else in the business; as is customary with some of these people, he had taken the house he had shown me to let to lodgers of his own class, making something by so doing; though, if his own account be correct, I'm at a loss to imagine how he contrived even to get his rent. From him I obtained the following statement:—

"Yes, I was a climbing-boy, and sarved a rigler printiceship for seven years. I was out on my printiceship when I was fourteen. Father was a silk-weaver, and did all he knew to keep me from being a sweep, but I would be a sweep, and nothink else." [This is not so very uncommon a predilection, strange as it may seem.] "So father, when he saw it was no use, got me bound printice. Father's alive now, and near 90 years of age. I don't know why I wished to be a sweep, 'cept it was this—there was sweeps always lived about here, and I used to see the boys with lots of money a tossin' and gamblin', and wished to have money too. You see they got money where they swept the chimneys; they used to get 2*d.* or 3*d.* for theirselves in a day, and sometimes 6*d.* from the people of the house, and that's the way they always had plenty of money. I niver thought anythink of the climbing; it wasn't so bad at all as some people would make you believe. There are two or three ways of climbing. In wide flues you climb with your elbows and your legs spread out, your feet pressing against the sides of the flue; but in narrow flues, such as nine-inch ones, you must slant it; you must have your sides in the angles, it's wider there, and go up just that way." [Here he threw himself into position—placing one arm close to his side, with the palm of the hand turned outwards, as if pressing the side of the flue, and extending the other arm high above his head, the hand apparently pressing in the same manner.] "There," he continued, "that's slantin'. You just put yourself in that way, and see how small you make yourself. I niver got to say stuck myself, but a many of them did; yes, and were taken out dead. They were smothered for want of air, and the fright, and a stayin' so long in the flue; you see the waistband of their trowsers sometimes got turned down in the climbing, and in narrow flues, when not able to get it up, then they stuck. I had a boy once—we were called to sweep a chimney down at Poplar. When we went in he looked up the flues, 'Well, what is it like?' I said. 'Very narrow,' says he, 'don't think I can get up there;' so after some time we gets on top of the house, and takes off the chimney-pot, and has a look down—it was wider a' top, and I thought as how he could go down. 'You had better buff it, Jim,' says I. I suppose you know what that means; but Jim wouldn't do it, and kept his trowsers on. So down he goes, and gets on very well till he comes to the shoulder of the flue, and then he couldn't stir. He shouts down, 'I'm stuck.' I shouts up and tells him what to do. 'Can't move,' says he, 'I'm stuck hard and fast.' Well, the people of the house got fretted like, but I says to them, 'Now my boy's stuck, but for Heaven's sake don't make a word of noise; don't say a word, good or bad, and I'll

see what I can do.' So I locks the door, and buffs it, and forces myself up till I could reach him with my hand, and as soon as he got his foot on my hand he begins to prize himself up, and gets loosened, and comes out at the top again. I was stuck myself, but I was stronger nor he, and I manages to get out again. Now I'll be bound to say if there was another master there as would kick up a row and a-worrited, that ere boy 'ud a niver come out o' that ere flue alive. There was a many o' them lost their lives in that way. Most all the printices used to come from the 'House' (workhouse.) There was nobody to care for them, and some masters used them very bad. I was out of my time at fourteen, and began to get too stout to go up the flues; so after knockin' about for a year or so, as I could do nothink else, I goes to sea on board a man-o'-war, and was away four year. Many of the boys, when they got too big and useless, used to go to sea in them days—they couldn't do nothink else. Yes, many of them went for sodgers; and I know some who went for Gipsies, and others who went for play-actors, and a many who got on to be swell-mobsmen, and thieves, and housebreakers, and the like o' that ere. There ain't nothink o' that sort a-goin' on now since the Ack of Parliament. When I got back from sea father asked me to larn his business; so I takes to the silk-weaving and larned it, and then married a weaveress, and worked with father for a long time. Father was very well off—well off and comfortable for a poor man—but trade was good then. But it got bad afterwards, and none on us was able to live at it; so I takes to the chimney-sweeping again. *A man might manage to live somehow at the sweeping, but the weaving was o' no use.* It was the furrin silks as beat us all up, that's the whole truth. Yet they tells us as how they was a-doin' the country good; but they may tell that to the marines—the sailors won't believe it—not a word on it. I've stuck to the sweeping ever since, and sometimes done very fair at it; but since the Ack there's so many leeks come to it that I don't know how they live—they must be eatin' one another up.

"Well, since you ask then, I can tell you that our people don't care much about law; they don't understand anythink about politics much; they don't mind things o' that ere kind. They only minds to get drunk when they can. Some on them fellows as you seed in there niver cleans theirselves from one year's end to the other. They'll kick up a row soon enough, with Chartists or anybody else. I thinks them Chartists are a weak-minded set; they was too much a frightened at nothink,—a hundred o' them would run away from one blue-coat, and that wasn't like men. I was often at Chartist meetings, and if they'd only do all they said there was a plenty to stick to them, for there's a somethink wants to be done very bad, for everythink is a-gettin' worser and worser every day. I used to do a good trade, but now I don't yarn a shilling a day all through the year (?). I may walk at this time three or four miles and not get a chimney to sweep, and then get only a sixpence or threepence, and sometimes nothink. It's a starvin', that's what it is; there's so much 'querying' a-goin' on. Querying? that's what we calls under-working*. If they'd all fix a riglar price we might do very well still. I'm 50 years of age, or thereabouts. I don't know much about the story of Mrs. Montague; it was afore my time. I heard of it though. I heard my mother talk about it; she used to read it out of books; she was a great reader—none on 'em could stand afore her for that. I was often at the dinner—the masters' dinner—that was for the boys; but that's all done away long ago, since the Ack of Parliament. I can't tell how many there was at it, but there's such a lot it's impossible to tell. How could any one tell all the sweeps as is in London? I'm sure I can't, and I'm sure nobody else can."

Some years back the sweepers' houses were often indicated by an elaborate sign, highly coloured. A sweeper, accompanied by a "chummy" (once a common name for the climbing-boy, being a corruption of chimney), was depicted on his way to a red brick house, from the chimneys of which bright yellow flames were streaming. Below was the detail of the things undertaken by the sweep, such as the extinction of fires in chimneys, the cleaning of smoke-jacks, &c., &c. A few of these signs, greatly faded, may be seen still. A sweeper, who is settled in what is accounted a "genteel neighbourhood," has now another way of making his calling known. He leaves a card whenever he hears of a new comer, a tape being attached, so that it can be hung up in the kitchen, and thus the servants are always in possession of his address. The following is a customary style:—

"Chimneys swept by the improved machine, much patronized by the Humane Society.

"W. H., Chimney Sweeper and Nightman, 1, —— Mews, in returning thanks to the inhabitants of the surrounding neighbourhood for the patronage he has hitherto received, begs to inform them that he sweeps all kinds of chimneys and flues in the best manner.

"W. H., attending to the business himself, cleans smoke-jacks, cures smoky coppers, and extinguishes chimneys when on fire, with the greatest care and safety; and, by giving the strictest personal attendance to business, performs what he undertakes with cleanliness and punctuality, whereby he hopes to ensure a continuance of their favours and recommendations.

"Clean cloths for upper apartments. Soot-doors to any size fixed. Observe the address, 1, —— Mews, near ——."

At the top of this card is an engraving of the machine; at the foot a rude sketch of a nightman's cart, with men at work. All the cards I saw reiterated the address, so that no mistake might lead the customer to a rival tradesman.

As to their politics, the sweepers are somewhat

* Querying means literally inquiring or asking for work at the different houses. The "queriers" among the sweeps are a kind of pedlar operatives.

similar to the dustmen and costermongers. A fixed hatred to all constituted authority, which they appear to regard as the police and the "beaks," seems to be the sum total of their principles. Indeed, it almost assumes the character of a fixed law, that persons and classes of persons who are themselves disorderly, and to a certain extent lawless, always manifest the most supreme contempt for the conservators of law and order in every degree. The police are therefore hated heartily, magistrates are feared and abominated, and Queen, Lords, and Commons, and every one in authority, if known anything about, are considered as natural enemies. A costermonger who happened to be present while I was making inquiries on this subject, broke in with this remark, "The costers is the chaps—the government can't do nothink with them—they allus licks the government." The sweepers have a sovereign contempt for all Acts of Parliament, because the only Act that had any reference to themselves "threw open," as they call it, their business to all who were needy enough and who had the capability of availing themselves of it. Like the "dusties" they are, I am informed, in their proper element in times of riot and confusion; but, unlike them, they are, to a man, Chartists, understanding it too, and approving of it, not because it would be calculated to establish a new order of things, but in the hope that, in the transition from one system to the other, there might be plenty of noise and riot, and in the vague idea that in some indefinable manner good must necessarily accrue to themselves from any change that might take place. This I believe to be in perfect keeping with the sentiments of similar classes of people in every country in the world.

The journeymen lay by no money when in work, as a fund to keep them when incapacitated by sickness, accident, or old age. There are, however, a few exceptions to the general improvidence of the class; some few belong to sick and benefit societies, others are members of burial clubs. Where, however, this is not the case, and a sweeper becomes unable, through illness, to continue his work, the mode usually adopted is to make a raffle for the benefit of the sufferer; the same means are resorted to at the death of a member of the trade. When a chimney-sweeper becomes infirm through age, he has mostly, if not invariably, no refuge but the workhouse.

The chimney-sweepers generally are regardless of the marriage ceremony, and when they do live with a woman it is in a state of concubinage. These women are always among the lowest of the street-girls—such as lucifer-match and orange girls, some of the very poorest of the coster girls, and girls brought up among the sweepers. They are treated badly by them, and often enough left without any remorse. The women are equally as careless in these matters as the men, and exchange one paramour for another with the same levity, so that there is a promiscuous intercourse continually going on among them. I am informed that, among the worst class of sweepers living with women, not one in 50 is married. To these couples very few children are born; but I am not able to state the proportion as compared with other classes.

There are some curious customs among the London sweepers which deserve notice. Their May-day festival is among the best known. The most intelligent of the masters tell me that they have taken this "from the milkmen's garland" (of which an engraving has been given). Formerly, say they, on the first of May the milkmen of London went through the streets, performing a sort of dance, for which they received gratuities from their customers. The music to which they danced was simply brass plates mounted on poles, from the circumference of which plates depended numerous bells of different tones, according to size; these poles were adorned with leaves and flowers, indicative of the season, and may have been a relic of one of the ancient pageants or mummeries.

The sweepers, however, by adapting themselves more to the rude taste of the people, appear to have completely supplanted the milkmen, who are now never seen in pageantry. In Strutt's "Sports and Pastimes of the People of England," I find the following with reference to the milk-people:—

"It is at this time," that is in May, says the author of one of the papers in the *Spectator*, "we see brisk young wenches in the country parishes dancing round the Maypole. It is likewise on the first day of this month that we see the ruddy milkmaid exerting herself in a most sprightly manner under a pyramid of silver tankards, and, like the Virgin Tarpeia, oppressed by the costly ornaments which her benefactors lay upon her. These decorations of silver cups, tankards, and salvers, were borrowed for the purpose, and hung round the milk-pails, with the addition of flowers and ribands, which the maidens carried upon their heads when they went to the houses of their customers, and danced in order to obtain a small gratuity from each of them. In a set of prints, called 'Tempest's Cries of London,' there is one called the 'Merry Milkmaid,' whose proper name was Kate Smith. She is dancing with the milk-pail, decorated as above mentioned, upon her head. Of late years the plate, with the other decorations, were placed in a pyramidical form, and carried by two chairmen upon a wooden horse. The maidens walked before it, and performed the dance without any incumbrance. I really cannot discover what analogy the silver tankards and salvers can have to the business of the milkmaids. I have seen them act with much more propriety upon this occasion, when, in place of these superfluous ornaments, they substituted a cow. The animal had her horns gilt, and was nearly covered with ribands of various colours formed into bows and roses, and interspersed with green oaken leaves and bunches of flowers."

With reference to the May-day festival of the sweepers the same author says:—"The chimney-sweepers of London have also singled out the first of May for their festival, at which time they parade the streets in companies, disguised in various manners. Their dresses are usually deco-

rated with gilt paper and other mock fineries; they have their shovels and brushes in their hands, which they rattle one upon the other; and to this rough music they jump about in imitation of dancing. Some of the larger companies have a fiddler with them, and a Jack in the Green, as well as a Lord and Lady of the May, who follow the minstrel with great stateliness, and dance as occasion requires. The Jack in the Green is a piece of pageantry consisting of a hollow frame of wood or wicker-work, made in the form of a sugar-loaf, but open at the bottom, and sufficiently large and high to receive a man. The frame is covered with green leaves and bunches of flowers, interwoven with each other, so that the man within may be completely concealed, who dances with his companions; and the populace are mightily pleased with the oddity of the moving pyramid."

Since the date of the above, the sweepers have greatly improved on their pageant, substituting for the fiddle the more noisy and appropriate music of the street-showman's drum and pipes, and adding to their party several diminutive imps, no doubt as representatives of the climbing-boys, clothed in caps, jackets, and trowsers, thickly covered with party-coloured shreds. These still make a show of rattling their shovels and brushes, but the clatter is unheard alongside the thunders of the drum. In this manner they go through the various streets for three days, obtaining money at various places, and on the third night hold a feast at one of their favourite public-houses, where all the sooty tribes resort, and, in company with their wives or girls, keep up their festivity till the next morning. I find that this festival is beginning to disappear in many parts of London, but it still holds its ground, and is as highly enjoyed as ever, in all the eastern localities of the metropolis.

It is but seldom that any of the large masters go out on May-day; this custom is generally confined to the little masters and their men. The time usually spent on these occasions is four days, during which as much as from 2*l.* to 4*l.* a day is collected; the sums obtained on the three first days are divided according to the several kinds of work performed. But the proceeds of the fourth day are devoted to a supper. The average gains of the several performers on these occasions are as follows:—

My lady, who acts as Columbine, and receives	2*s.* per day.
My lord, who is often the master himself, but usually one of the journeymen	3*s.* „
Clown	3*s.* „
Drummer	4*s.* „
Jack in the green, who is often an individual acquaintance, and does not belong to the trade .	3*s.* „
And the boys, who have no term term applied to them, receive from	1*s.* to 1*s.* 6*d.* „

The share accruing to the boys is often spent in purchasing some article of clothing for them, but the money got by the other individuals is mostly spent in drink.

The sweepers, however, not only go out on May-day, but likewise on the 5th of November. On the last Guy-Fawkes day, I am informed, some of them received not only pence from the public, but silver and gold. "It was quite a harvest," they say. One of this class, who got up a gigantic Guy Fawkes and figure of the Pope on the 5th of November, 1850, cleared, I am informed, 10*l.* over and above all expenses.

For many years, also, the sweepers were in the habit of partaking of a public dinner on the 1st of May, provided for every climbing-boy who thought proper to attend, at the expense of the Hon. Mrs. Montagu. The romantic origin of this custom, from all I could learn on the subject, is this:—The lady referred to, at the time a widow, lost her son, then a boy of tender years. Inquiries were set on foot, and all London heard of the mysterious disappearance of the child, but no clue could be found to trace him out. It was supposed that he was kidnapped, and the search at length was given up in despair. A long time afterwards a sweeper was employed to cleanse the chimneys of Mrs. Montagu's house, by Portman-square, and for this purpose, as was usual at the time, sent a climbing-boy up the chimney, who from that moment was lost to him. The child did not return the way he went up, but it is supposed that in his descent he got into a wrong flue, and found himself, on getting out of the chimney, in one of the bedrooms. Wearied with his labour, it is said that he mechanically crept between the sheets, all black and sooty as he was. In this state he was found fast asleep by the housekeeper. The delicacy of his features and the soft tones of his voice interested the woman. She acquainted the family with the strange circumstance, and, when introduced to them with a clean face, his voice and appearance reminded them of their lost child. It may have been that the hardships he endured at so early an age had impaired his memory, for he could give no account of himself; but it was evident, from his manners and from the ease which he exhibited, that he was no stranger to such places, and at length, it is said, the Hon. Mrs. Montagu recognised in him her long-lost son. The identity, it was understood, was proved beyond doubt. He was restored to his rank in society, and in order the better to commemorate this singular restoration, and the fact of his having been a climbing-boy, his mother annually provided an entertainment on the 1st of May, at White Conduit House, for all the climbing-boys of London who thought proper to partake of it. This annual feast was kept up during the lifetime of the lady, and, as might be expected, was numerously attended, for since there were no question asked and no document required to prove any of the guests to be climbing-boys, very many of the precocious urchins of the metropolis used to blacken their faces for this special occasion. This annual feast continued, as I have said, as long as the lady lived. Her son continued it

only for three or four years afterwards, and then, I am told, left the country, and paid no further attention to the matter.

Of the story of the young Montagu, Charles Lamb has given the following account:—

"In one of the state-beds at Arundel Castle, a few years since—under a ducal canopy (that seat of the Howards is an object of curiosity to visitors, chiefly for its beds, in which the late duke was especially a connoisseur)—encircled with curtains of delicatest crimson, with starry coronets interwoven—folded between a pair of sheets whiter and softer than the lap where Venus lulled Ascanius—was discovered by chance, after all methods of search had failed, at noon-day, fast asleep, a lost chimney-sweeper. The little creature having somehow confounded his passage among the intricacies of those lordly chimneys, by some unknown aperture had alighted upon this magnificent chamber, and, tired with his tedious explorations, was unable to resist the delicious invitement to repose, which he there saw exhibited; so, creeping between the sheets very quietly, he laid his black head on the pillow and slept like a young Howard." . . . . "A high instinct," adds Lamb, "was at work in the case, or I am greatly mistaken. Is it probable that a poor child of that description, with whatever weariness he might be visited, would have ventured under such a penalty as he would be taught to expect, to uncover the sheets of a duke's bed, and deliberately to lay himself down between them, when the rug or the carpet presented an obvious couch still far above his pretensions?—is this probable, I would ask, if the great power of nature, which I contend for, had not been manifested within him, prompting to the adventure? Doubtless, this young nobleman (for such my mind misgives me he must be) was allured by some memory not amounting to full consciousness of his condition in infancy, when he was used to be lapt by his mother or his nurse in just such sheets as he there found, into which he was now but creeping back as into his proper incubation (*incunabula*) and resting place. By no other theory than by his sentiment of a pre-existent state (as I may call it) can I explain a deed so venturous."

There is a strong strain of romance throughout the stories of the lost and found young Montagu. I conversed with some sweepers on the subject. The majority had not so much as heard of the occurrence, but two who had heard of it—both climbing-boys in their childhood—had heard that the little fellow was found in his mother's house. In a small work, the "Chimney-Sweepers' Friend," got up in aid of the Society for the Supersedence of Climbing Boys, by some benevolent Quaker ladies and others (the Quakers having been among the warmest supporters of the suppression of climbers), and "arranged" (the word "edited" not being used) by J. Montgomery, the case of the little Montagu is not mentioned, excepting in two or three vague poetical allusions.

The account given by Lamb (although pronounced apocryphal by some) appears to be the more probable version; and to the minds of many is shown to be conclusively authentic, as I understand that, when Arundel Castle is shown to visitors, the bed in which the child was found is pointed out; nor is it likely that in such a place the story of the ducal bed and the little climbing-boy would be *invented*.

The following account was given by the wife of a respectable man (now a middle-aged woman) and she had often heard it from her mother, who passed a long life in the neighbourhood of Mrs. Montagu's residence:—

"Lady M. had a son of tender years, who was supposed to have been stolen for the sake of his clothes. Some time after, there was an occasion when the sweeps were necessary at Montagu House. A servant noticed one of the boys, being at first attracted by his superior manner, and her curiosity being excited fancied a resemblance in him to the lost child. She questioned his master respecting him, who represented that he had found him crying and without a home, and thereupon took him in, and brought him up to his trade. The boy was questioned apart from his master, as to the treatment he received; his answers were favourable; and the consequence was, a compensation was given to the man, and the boy was retained. All doubt was removed as to his identity."

The annual feast at "White Condick," so agreeable to the black fraternity, was afterwards continued in another form, and was the origin of a well-known society among the master sweepers, which continued in existence till the abolition of the climbing-boys by Act of Parliament. The masters and the better class of men paid a certain sum yearly, for the purpose of binding the children of the contributors to other trades. In order to increase the funds of this institution, as the dinner to the boys at White Conduit House was an established thing, the masters continued it, and the boys of every master who belonged to the society went in a sort of state to the usual place of entertainment every 1st of May, where they were regaled as formerly. Many persons were in the habit of flocking on this day to White Conduit House to witness the festivities of the sweepers on this occasion, and usually contributed something towards the society. As soon, however, as the Act passed, this also was discontinued, and it is now one of the legends connected with the class.

Sweeping of the Chimneys of Steam-Vessels.

The sweeping of the flues in the boilers of steam-boats, in the Port of London, and also of land boilers in manufactories, is altogether a distinct process, as the machine cannot be used until such time as the parties who are engaged in this business travel a long way through the flues, and reach the lower part of the chimney or funnel where it communicates with the boilers and receives the smoke in its passage to the upper air. The boilers in the large sea-going steamers are of curious construction; in some large steamers there are four separate boilers with three furnaces

in each, the flues of each boiler uniting in one beneath the funnel; immediately beyond the end of the furnace, which is marked by a little wall constructed of firebrick to prevent the coals and fire from running off the firebars, there is a large open space very high and wide, and which space after a month's steaming is generally filled up with soot, somewhat resembling a snow drift collected in a hollow, were it not for its colour and the fact that it is sometimes in a state of ignition; it is, at times, so deep, that a man sinks to his middle in it the moment he steps across the firebridge. Above his head, and immediately over the end of the furnace, he may perceive an opening in what otherwise would appear to be a solid mass of iron; up to this opening, which resembles a doorway, the sweeper must clamber the best way he can, and when he succeeds in this he finds himself in a narrow passage completely dark, but with so strong a current of air rushing through it from the furnaces beneath towards the funnel overhead that it is with difficulty the wick lamp which he carries in his hand can be kept burning. This passage, between the iron walls on either side, is lofty enough for a tall man to stand upright in, but does not seem at first of any great extent; as he goes on, however, to what appears the end, he finds out his mistake, by coming to a sharp turn which conducts him back again towards the open space in the centre of the boiler, but which is now hid from him by the hollow iron walls which on every side surround him, and within which the waters boil and seethe as the living flames issuing from the furnaces rush and roar through these winding passages; another sharp turn leads back to the front of the boilers, and so on for seven or eight turns, backwards and forwards, like the windings in a maze, till at the last turn a light suddenly breaks upon him, and, looking up, he perceives the hollow tube of the funnel, black and ragged with the adhering soot.

Here, then, the labour of the sweeper commences: he is armed with a brush and shovel, and laying down his lamp in a space from which he has previously shovelled away the soot, which in many parts of the passage is knee deep, he brushes down the soot from the sides and roof of the passage, which being done he shovels it before him into the next winding; this process he repeats till he reaches, by degrees, the opening where he ascended. Whenever the accumulation of soot is so great that it is likely to block up the passage in the progress of his work, he wades through and shovels as much as he thinks necessary out of the opening into the large space behind the furnaces, then resumes his work, brushing and shovelling by turns, till the flues are cleared; when this is accomplished, he descends, and the fire bars being previously removed, he shovels the soot, now all collected together, over the firebridge and into the ashpit of the furnace; other persons stand ready in the stoke-hole armed with long iron rakes, with which they drag out the soot from the ashpits; and others shovel it into sacks, which they make fast to tackle secured to the upper deck, by which they "bowse" it up out of the engine-room, and either discharge it overboard or put it into boats preparatory to being taken ashore. In this manner an immense quantity of soot is removed from the boilers of a large foreign-going steamer when she gets into port, after a month or six weeks' steaming, having burned in that time perhaps 700 or 800 tons of coal: this work is always performed by the stokers and coal-trimmers in the foreign ports, who seldom, if ever, get anything extra for it, although it is no uncommon thing for some of them to be ill for a week after it.

In the port of London, however, the sweeper comes into requisition, who, besides going through the process already described, brings his machine with him, and is thus enabled to cleanse the funnel, and to increase the quantity of soot. Some of the master sweepers, who have the cleansing of the steam-boats in the river, and the sweeping of boiler flues are obliged to employ a good many men, and make a great deal of money by their business. The use of anthracite coals, however, and some modern improvements, by which air at a certain temperature is admitted to certain parts of the furnace, have in many instances greatly lessened, if they have not altogether prevented, the accumulation of soot, by the prevention of smoke; and it seems quite possible, from the statements made by many eminent scientific and practical men who were examined before a select committee of the House of Commons, presided over by Mr. Mackinnon, in 1843, that by having properly-constructed stoves, and a sufficient quantity of pure air properly admitted, not only less fuel might be burned, and produce a greater amount of heat, but soot would cease to accumulate, so that the necessity for sweepers would be no longer felt, and there would be no fear of fires from the ignition of soot in the flues of chimneys; blacks and smoke, moreover, would take their departure together; and with them the celebrated London fog might also, in a great measure, disappear.

The funnels of steamers are generally swept at from 8*d.* to 1*s.* 6*d.* per funnel. The Chelsea steamers are swept by Mr. Allbrook, of Chelsea; the Continental, by Mr. Hawsey, of Rosemary-lane; and the Irish and Scotch steamers, by Mr. Tuff, who resides in the East London district.

Of the "Ramoneur" Company.

The Patent Ramoneur Company demands, perhaps, a special notice. It was formed between four and five years ago, and has now four stations: one in Little Harcourt-street, Bryanstone-square; another in New-road, Sloane-street; a third in Charles-place, Euston-square; and the fourth in William-street, Portland-town.

"This Company has been formed," the prospectus stated, "for the purpose of cleansing chimneys with the Patent Ramoneur Machine, and introducing various other improvements in the business of chimney sweeping. Chimneys are daily swept with this machine where others have failed."

The Company charge the usual prices, and all

Original from HARVARD UNIVERSITY

the men employed have been brought up as sweepers. The patent machine is thus described:—

"The Patent Ramoneur Machine consists of four brushes, forming a square head, which, by means of elastic springs, contracts or expands, according to the space it moves in; the rods attached to this head or brush are supplied at intervals with a universal spring-joint, capable of turning even a right angle, and the whole is surmounted with a double revolving ball, having also a universal spring-joint, which leads the brush with certainty into every corner, cleansing its route most perfectly."

The recommendation held out to the public is, that the patented chimney-machine sweeps cleaner than that in general use, and for the reasons assigned; and that, being constructed with more and better springs, it is capable of "turning even a right angle," which the common machine often leaves unswept. This was and is commonly said of the difference between the cleansing of the chimney by a climbing-boy and that effected by the present mechanical appliances in general use —the boy was "better round a corner."

The patent machines now worked in London are fifteen in number, and fifteen men are thus employed. Each man receives as a weekly wage, always in money, 14*s.*, besides a suit of clothes yearly. The suit consists of a jacket, waistcoat, and trousers, of dark-coloured corduroy; also a "frock" or blouse, to wear when at work, and a cap; the whole being worth from 35*s.* to 40*s.* This payment is about equivalent to that received weekly by the journeymen in the regular or honourable trade; for although higher in nominal amount as a weekly remuneration, the Ramoneur operatives are not allowed any perquisites whatever. The resident or manager at each station is also a working chimney-sweeper for the Company, and at the same rate as the others, his advantage being that he lives rent-free. At one station which I visited, the resident had two comfortable-looking up-stairs'-rooms (the stations being all in small streets), where he and his wife lived; while the "cellar," which was indeed but the ground floor, although somewhat lower than the doorstep, was devoted to business purposes, the soot being stored there. It was boarded off into separate compartments, one being at the time quite full of soot. All seemed as clean and orderly as possible. The rent of those two rooms, unfurnished, would not be less than 4*s.* or 5*s.* a week, so that the resident's payment may be put at about 50*l.* a year. The patent-machine operatives sweep, on an average, the same number of chimneys each, as a master chimney-sweeper's men in a good way of business in the ordinary trade.

Of the Brisk and Slack Seasons, and the Casual Trade among the Chimney-Sweepers.

As among the rubbish-carters in the unskilled, and the tailors and shoemakers of the skilled trades, the sweepers' trade also has its slackness and its briskness, and from the same cause—the difference in the *seasons*. The seasons affecting the sweepers' trade are, however, the *natural* seasons of the year, the recurring summer and winter, while the seasons influencing the employment of West-end tailors are the *arbitrary* seasons of fashion.

The chimney-sweepers' *brisk* season is in the winter, and especially at what may be in the respective households the periods of the resumption and discontinuance of sitting-room fires.

The sweepers' seasons of briskness and slackness, indeed, may be said then to be ruled by the thermometer, for the temperature causes the increase or diminution of the number of fires, and consequently of the production of soot. The thermometrical period for fires appears to be from October to the following April, both inclusive (seven months), for during that season the temperature is below 50°. I have seen it stated, and I believe it is merely a statement of a fact, that at one time, and even now in some houses, it was customary enough for what were called "great families" to have a fixed day (generally Michaelmas-day, Sept. 29) on which to commence fires in the sitting-rooms, and another stated day (often May-day, May 1) on which to discontinue them, no matter what might be the mean temperature, whether too warm for the enjoyment of a fire, or too cold comfortably to dispense with it. Some wealthy persons now, I am told—such as call themselves "economists," while their servants and dependants apply the epithet "mean"—defer fires until the temperature descends to 42°, or from November to March, both inclusive, a season of only five months.

As this question of the range of the thermometer evidently influences the seasons, and therefore, the casual labour of the sweepers, I will give the following interesting account of the changing temperature of the metropolis, month by month, the information being derived from the observations of 25 years (1805 to 1830), by Mr. Luke Howard. The average temperature appears to be:—

	Degrees.		Degrees.
January	35·1	July	63·1
February	38·9	August	57·1
March	42·0	September	50·1
April	47·5	October	42·4
May	54·9	November	41·9
June	59·6	December	38·3

London, I may further state, is 2½ degrees warmer than the country, especially in winter, owing to the shelter of buildings and the multiplicity of the fires in the houses and factories. In the summer the metropolis is about 1¼ degree hotter than the country, owing to want of free air in London, and to a cause little thought about —the reverberations from narrow streets. In spring and autumn, however, the temperature of both town and country is nearly equal.

In London, moreover, the nights are 11·3 degrees colder than the days; in the country they

Original from HARVARD UNIVERSITY

are 15·4 degrees colder. The extreme ranges of the temperature in the day, in the capital, are from 20° to 90°. The thermometer *has* fallen below zero in the night time, but not frequently.

In London the hottest months are 28 degrees warmer than the coldest; the temperature of July, which is the hottest month, being 63·1; and that of January, the coldest month, 35·1 degrees.

The month in which there are the greatest number of extremes of heat and cold is January. In February and December there are (generally speaking) only two such extreme variations, and five in July; through the other months, however, the extremes are more diffused, and there are only two spring and two autumn months (April and June—September and November), which are not exposed to great differences of temperature.

The mean temperature assumes a rate of increase in the different months, which may be represented by a curve nearly equal and parallel with one representing the progress of the sun in declination.

Hoar-frosts occur when the thermometer is about 39°, and the dense yellow fogs, so peculiar to London, are the most frequent in the months of November, December, and January, whilst the temperature ranges below 40°.

The busy season in the chimney-sweepers' trade commences at the beginning of November, and continues up to the month of May; during the remainder of the year the trade is "slack." When the slack season has set in nearly 100 men are thrown out of employment. These, as well as many of the single-handed masters, resort to other kinds of employment. Some turn costermongers, others tinkers, knife-grinders, &c., and others migrate to the country and get a job at hay-making, or any other kind of unskilled labour. Even during the brisk season there are upwards of 50 men out of employment; some of these occasionally contrive to get a machine of their own, and go about "knulling,"—getting a job where they can.

Many of the master sweepers employ in the summer months only two journeymen, whereas they require three in the winter months; but this, I am informed, is not the general average, and that it will be more correct to compute it for the whole trade, in the proportion of two and a half to two. We may, then, calculate that one-fourth of the entire trade is displaced during the slack season.

This, then, may be taken as the extent of casual labour, with all the sufferings it entails upon improvident, and even upon careful working-men.

A youth casually employed as a sweeper gave the following account:—"I jobs for the sweeps sometimes, sir, as I 'd job for anybody else, and if you have any herrands to go, and will send me, I 'll be unkimmon thankful. I haven't no father and don't remember one, and mother might do well but for the ruin (gin). I calls it 'ruin' out of spite. No, I don't care for it myself. I like beer ten to a farthing to it. "She 's a ironer, sir, a stunning good one, but I don't like to talk about her, for she might yarn a hatful of browns—3*s.* 6*d.* a day; and when she has pulled up for a month or more it 's stunning is the difference. I 'd rather not be asked more about that. Her great fault against me is as I won't settle. I was one time put to a woman's shoemaker as worked for a ware'us. He was a relation, and I was to go prentice if it suited. But I couldn't stand his confining ways, and I 'm sartain sure that he only wanted me for some tin mother said she 'd spring if all was square. He was bad off, and we lived bad, but he always pretended he was going to be stunning busy. So I hooked it. I 'd other places—a pot-boy's was one, but no go. None suited.

"Well, I can keep myself now by jobbing, leastways I can partly, for I have a crib in a corner of mother's room, and my rent 's nothing, and when she 's all right *I'm* all right, and she gets better as I grows bigger, I think. Well, I don't know what I 'd like to be; something like a lamp-lighter, I think. Well, I look out for sweep jobs among others, and get them sometimes. I don't know how often. Sometimes three mornings a week for one week; then none for a month. Can any one live by jobbing that way for the sweeps? No, sir, nor get a quarter of a living; but it 's a help. I know some very tidy sweeps now. I 'm sure I don't know what they are in the way of trade. O, yes, now you ask that, I think they 're masters. I've had 6*d.* and half-a-pint of beer for a morning's work, jobbing like. I carry soot for them, and I 'm lent a sort of jacket, or a wrap about me, to keep it off my clothes—though a Jew wouldn't sometimes look at 'em—and there 's worser people nor sweeps. Sometimes I 'll get only 2*d.* or 3*d.* a day for helping that way, a carrying soot. I don't know nothing about weights or bushels, but I know I've found it —— heavy.

"The way, you see, sir, is this here: I meets a sweep as knows me by sight, and he says, 'Come along, Tom 's not at work, and I want you. I have to go it harder, so you carry the soot to our place to save my time, and join me again at No. 39.' That 's just the ticket of it. Well, no; I wouldn't mind being a sweep for myself with my own machine; but I 'd rather be a lamp-lighter. How many help sweeps as I do? I can't at all say. No, I don't know whether it 's 10, or 20, or 100, or 1000. I 'm no scholard, sir, that 's one thing. But it 's very seldom such as me 's wanted by them. I can't tell what I get for jobbing for sweeps in a year. I can't guess at it, but it 's not so much, I think, as from other kinds of jobbing. Yes, sir, I haven't no doubt that the t'others as jobs for sweeps is in the same way as me. I think I may do as much as any of 'em that way, quite as much."

OF THE "LEEKS" AMONG THE CHIMNEY-SWEEPERS.

THE *Leeks* are men who have not been brought up to the trade of chimney sweeping, but have adopted it as a speculation, and are so called from their entering *green*, or inexperienced, into the

Original from HARVARD UNIVERSITY

business. There are I find as many as 200 leeks altogether among the master chimney-sweepers of the metropolis. Of the "high masters" the greater portion are leeks—no less than 92 out of 106. I was informed that one of this class was formerly a solicitor, others had been ladies' shoemakers, and others master builders and bricklayers. Among the lower-class sweepers who have taken to this trade, there are dustmen, scavagers, bricklayers' labourers, soldiers, costermongers, tinkers, and various other unskilled labourers.

The leeks are regarded with considerable dislike by the class of masters who have been regularly brought up to the business, and served their apprenticeships as climbing-boys. These look upon the leeks as men who intrude upon, or interfere with, their natural and, as they account it, legal rights—declaring that only such as have been brought up to the business should be allowed to establish themselves in it as masters. The chimney-sweepers, as far as I can learn, have never possessed any guild, or any especial trade regulations, and this opinion of their rights being invaded by the leeks arises most probably from their knowledge that during the climbing-boy system every lad so employed, unless the son of his employer, was obliged to be apprenticed.

This jealousy towards the leeks does not at all affect the operative sweepers, as some of these leeks are good masters, and among them, perhaps, is to be found the majority of the capitalists of the chimney-sweeping trade, paying the best wages, and finding their journeymen proper food and lodging. Into whatever district I travelled I heard the operative chimney-sweepers speak highly in favour of some of the leeks.

Many of the small masters, however, said "it were a shame" for persons who had never known the horrors of climbing to come into the trade and take the bread out of the mouths of those who had undergone the drudgery of the climbing system; and there appears to be some little justice in their remarks.

Since the introduction of machines into the chimney-sweeping trade the masters have increased considerably. In 1816 there were 200 masters, and now there are 350. Before the machines were introduced, the high master sweepers or "great gentlemen," as they were called, numbered only about 20; their present number is 106. The lower-class and master-men sweepers, on the other hand, were, under the climbing system, from 150 to 180 in number; but at present there are as many as 240 odd. The majority of these fresh hands are "leeks," not having been bred to the business.

Of the Inferior Chimney-Sweepers—the "Knullers" and "Queriers."

The majority of occupations in all civilized communities are divisible into two distinct classes, the employers and the employed. The employers are necessarily capitalists to a greater or less extent, providing generally the materials and implements necessary for the work, as well as the subsistence of the workmen, in the form of wages and appropriating the proceeds of the labour, while the employed are those who, for the sake of the present subsistence supplied to them, undertake to do the requisite work for the employer. In some few trades these two functions are found to be united in the same individuals. The class known as peasant proprietors among the cultivators of the soil are at once the labourers and the owners of the land and stock. The cottiers, on the other hand, though renting the land of the proprietor, are, so to speak, peasant farmers, tilling the land for themselves rather than doing so at wages for some capitalist tenant. In handicrafts and manufactures the same combination of functions is found to prevail. In the clothing districts the domestic workers are generally their own masters, and so again in many other branches of production. These trading operatives are known by different names in different trades. In the shoe trade, for instance, they are called "chamber-masters," in the "cabinet trade" they are termed "garret-masters," and in "the cooper's trade" the name for them is "small trading-masters." Some style them "master-men," and others, "single-handed masters." In all occupations, however, the master-men are found to be especially injurious to the interests of the entire body of both capitalists and operatives, for, owing to the limited extent of their resources, they are obliged to find a market for their work, no matter at what the sacrifice, and hence by their excessive competitions they serve to lower the prices of the trade to a most unprecedented extent. I have as yet met with no occupation in which the existence of a class of master-men has worked well for the interest of the trade, and I have found many which they have reduced to a state of abject wretchedness. It is a peculiar circumstance in connection with the master-men that they abound only in those callings which require a small amount of capital, and which, consequently, render it easy for the operative immediately on the least disagreement between him and his employer to pass from the condition of an operative into that of a trading workmen. When among the fancy cabinet-makers I had a statement from a gentleman, in Aldersgate-street, who supplied the materials to these men, that a fancy cabinet-maker, the manufacturer of writing-desks, tea-caddies, ladies' work-boxes, &c., could begin, and did begin, business on less than 3*s.* 6*d.* A youth had just then bought materials of him for 2*s.* 6*d.* to "begin on a small desk," stepping at once out of the trammels of apprenticeship into the character of a master-man. Now this facility to commence business on a man's own account is far greater in the chimney-sweepers' trade than even in the desk-makers,' for the one needs no previous training, while the other does.

Thus when other trades, skilled or unskilled, are depressed, when casual labour is with a mass of workpeople more general than constant labour, they naturally inquire if they "cannot do better at something else," and often resort to such trades as the chimney-sweepers'. It is open to

all, skilled and unskilled alike. Distress, a desire of change, a vagabond spirit, a hope to "better themselves," all tend to swell the ranks of the single-handed master chimney-sweepers; even though these men, from the casualties of the trade in the way of "seasons," &c., are often exposed to great privations.

There are in all 147 single-handed masters, who are thus distributed throughout the metropolis:—

Southwark (17), Chelsea (11), Marylebone, Shoreditch, and Whitechapel (each 9), Hackney, Stepney, and Lambeth (each 8), St. George's-in-the-East (7), Rotherhithe (6), St. Giles' and East London (each 5), Bethnal-green, Bermondsey, Camberwell, and Clapham (each 4), St. Pancras, Islington, Walworth, and Greenwich (each 3), St. James's (Westminster), Holborn, Clerkenwell, St. Luke's, Poplar, Westminster, West London, City, Wandsworth, and Woolwich (each 1); in all, 147.

Thus we perceive, that the single-handed masters abound in the suburbs and poorer districts; and it is generally in those parts where the lower rate of wages is paid that these men are found to prevail. Their existence appears to be at once the cause and the consequence of the depreciation of the labour.

Of the single-handed masters there is a sub-class known by the name of "knullers" or "queriers."

The *knullers* were formerly, it is probable, known as knellers. The Saxon word *Cnyllan* is to knell (to knull properly), or sound a bell, and the name "knuller" accordingly implies the sounder of a bell, which has been done, there can be no doubt, by the London chimney-sweepers as well as the dustmen, to announce their presence, and as still done in some country parts. One informant has known this to be the practice at the town of Hungerford in Berkshire. The bell was in size between that of the muffin-man and the dustman.

The knuller is also styled a "*querier*," a name derived from his making *inquiries* at the doors of the houses as to whether his services are required or are likely to be soon required, calling even where they know that a regular resident chimney-sweeper is employed. The men go along calling "sweep," more especially in the suburbs, and if asked "Are you Mr. So-and-So's man?" answer in the affirmative, and may then be called in to sweep the chimneys, or instructed to come in the morning. Thus they receive the full charge of an established master, who, for the sake of his character and the continuance of his custom, must do his work properly; while if such work be done by the knuller, it will be hurriedly and therefore badly done, as all work is, in a general way, when done under false pretences.

Some of the sharpest of these men, I am told, have been reared up as sweepers; but it appears, although it is a matter difficult to ascertain with precision, the majority have been brought up to some generally unskilled calling, as scavagers, costermongers, tinkers, bricklayers' labourers, soldiers, &c. The knullers or queriers are almost all to be found among the lower class chimney-sweepers. There are, from the best information to be obtained, from 150 to 200 of them. Not only do they scheme for employment in the way I have described, but some of them call at the houses of both rich and poor, boldly stating that they had been *sent* by Mr. —— to sweep the flues. I was informed by several of the master sweepers, that many of the fires which happen in the metropolis are owing to persons employing these "knullers," "for," say the high masters, "they scamp the work, and leave a quantity of soot lodged in the chimney, which, in the event of a large fire being kept in the range or grate, ignites." This opinion as to the fires in the chimneys being caused by the scamped work of the knullers must be taken with some allowance. Tradesmen, whose established business is thus, as they account it, usurped, are naturally angry with the usurpers.

There is another evil, so say the regular masters, resulting from the employment of the knullers—the losses accruing to persons employing them, as "they take anything they can lay their hands upon."

This, also, is a charge easy to make, but not easy to refute, or even to sift. One master chimney-sweeper told me that when chimneys are swept in rich men's houses there is almost always some servant in attendance to watch the sweepers. If the rich, I am told, be watchful under these circumstances, the poor are more vigilant.

The distribution of the knullers or queriers is as follows:—Southwark (17), Chelsea and St. Giles' (11 each), Shoreditch and Whitechapel (10 each), Lambeth (9), Marylebone, Stepney and Walworth (8 each), St. George's in the East and Woolwich (7 each), Islington and Hackney (6 each), East London, Rotherhithe, and Greenwich (5 each), Paddington, St. Pancras, East London, Retherhithe and Greenwich (5 each), Paddington, St. Pancras, Bethnal Green, Bermondsey, and Clapham (4 each), Westminster, St. Martin's, Holborn, St. Luke's, West London, Poplar, and Camberwell (3 each); St. James's (Westminster), Clerkenwell, City of London, and Wandsworth (2 each), Kensington (1); in all, 183.

Like the single-handed men the knullers abound in the suburbs. I endeavoured to find a knuller who had been a skilled labourer, and was referred to one who, I was told, had been a working plumber, and a "good hand at spouts." I found him a doggedly ignorant man; he saw no good, he said, in books or newspapers, and "wouldn't say nothing to me, as I'd told him it would be printed. He wasn't a going to make a holy-show [so I understood him] of *his*-self."

Another knuller (to whom I was referred by a master who occasionally employed him as a journeyman) gave me the following account. He was "doing just middling" when I saw him, he said, but his look was that of a man who had known privations, and the soot actually seemed to bring out his wrinkles more fully, although he told me he was only between 40 and 50 years old; he believed he was not 46.

"I was hard brought up, sir," he said; "ay, them as 'll read your book—I mean them readers as is well to do—cannot fancy how hard. Mother was a widow; father was nobody knew where; and, poor woman, she was sometimes distracted that a daughter she had before her marriage, went all wrong. She was a washerwoman, and slaved herself to death. She died in the house [workhouse] in Birmingham. I can read and write a little. I was sent to a charity school, and when I was big enough I was put 'prentice to a gunsmith at Birmingham. I 'm master of the business generally, but my perticler part is a gun lock-filer. No, sir, I can't say as ever I liked it; nothing but file file all day. I used to wish I was like the free bits o' boys that used to beg steel filings of me for their fifth of November fireworks. I never could bear confinement. It 's made me look older than I ought, I know, but what can a poor man do? No, I never cared much about drinking. I worked in an iron-foundry when I was out of my time. I had a relation that was foreman there. Perhaps it might be that, among all the dust and heat and smoke and stuff, that made me a sweep at last, for I was then almost or quite as black as a sweep.

"Then I come up to London; ay, that must be more nor 20 years back. O, I came up to better myself, but I couldn't get work either at the gun-makers—and I fancy the London masters don't like Birmingham hands—nor at the iron-foundries, and the iron-foundries is nothing in London to what they is in Staffordshire and Warwickshire; nothing at all, they may say what they like. Well, sir, I soon got very bad off. My togs was hardly to call togs. One night—and it was a coldish night, too—I slept in the park, and was all stiff and shivery next morning. As I was wandering about near the park, I walked up a street near the Abbey—King-street, I think it is—and there was a picture outside a public-house, and a writing of men wanted for the East India Company's Service. I went there again in the evening, and there was soldiers smoking and drinking up and down, and I 'listed at once. I was to have my full bounty when I got to the depôt—Southampton I think they called it. Somehow I began to rue what I 'd done. Well, I hardly can tell you why. O, no; I don't say I was badly used; not at all. But I had heard of snakes and things in the parts I was going to, and I gently hooked it. I was a navvy on different rails after that, but I never was strong enough for that there work, and at last I couldn't get any more work to do. I came back to London; well, sir, I can't say, as you ask, why I came to London 'stead of Birmingham. I seemed to go natural like. I could get nothing to do, and Lord! what I suffered! I once fell down in the Cut from hunger, and I was lifted into Watchorn's, and he said to his men, 'Give the poor fellow a little drop of brandy, and after that a biscuit; the best things he can have.' He saved my life, sir. The people at the bar—they see'd it was no humbug—gathered 7½*d.* for me. A penny a-piece from some of Maudslay's men, and a halfpenny from a gent that hadn't no other change, and a poor woman as I was going away slipt a couple of trotters into my hand.

"I slept at a lodging-house, then, in Baldwin's-gardens when I had money, and one day in Gray's inn-lane I picked up an old gent that fell in the middle of the street, and might have been run over. After he 'd felt in all his pockets, and found he was all right, he gave me 5*s.* I knew a sweep, for I sometimes slept in the same house, in King-street, Drury-lane; and he was sick, and was going to the big house. And he told me all about his machines, that 's six or seven years back, and said if I 'd pay 2*s.* 6*d.* down, and 2*s.* 6*d.* a week, if I couldn't pay more, I might have his machine for 20*s.* I took it at 17*s.* 6*d.*, and paid him every farthing. That just kept him out of the house, but he died soon after.

"Yes, I 've been a sweep ever since. I 've had to shift as well as I could I don't know that I I 'm what you call a Nuller, or a Querier. Well, if I 'm asked if I 'm anybody's man, I don't like to say 'no,' and I don't like to say 'yes;' so I says nothing if I can help it. Yes, I call at houses to ask if anything 's wanted. I 've got a job that way sometimes. If they took me for anybody's man, I can't help that. I lodge with another sweep which is better off nor I am, and pay him 2*s.* 9*d.* a week for a little stair-head place with a bed in it. I think I clear 7*s.* a week, one week with another, but that 's the outside. I never go to church or chapel. I 've never got into the way of it. Besides, I wouldn't be let in, I s'pose, in my togs. I 've only myself. I can't say I much like what I 'm doing, but what can a poor man do?"

Of the Fires of London.

Connected with the subject of chimney sweeping is one which attracts far less of the attention of the legislature and the public than its importance would seem to demand: I mean the fires in the metropolis, with their long train of calamities, such as the loss of life and of property. These calamities, too, especially as regards the loss of property, are almost all endured by the poor, the destruction of whose furniture is often the destruction of their whole property, as insurances are rarely effected by them; while the wealthier classes, in the case of fires, are not exposed to the evils of houselessness, and may be actually gainers by the conflagration, through the sum for which the property was insured.

"The daily occurrence of fires in the metropolis," say the Board of Health, "their extent, the number of persons who perish by them, the enormous loss of property they occasion, the prevalence of incendiarism, the apparent apathy with which such calamities are regarded, and the rapidity with which they are forgotten, will hereafter be referred to as evidence of a very low social condition and defective administrative organization. These fires, it was shown nearly a century ago, when the subject of insurance was debated in Parliament, were frequently caused from

Original from HARVARD UNIVERSITY

not having chimneys swept in proper time." I am informed that a chimney may be on fire for many days, unknown to the inmates of the house, and finally break out in the body of the building by its getting into contact with some beam or wood-work. The recent burning of Limehouse Church was occasioned by the soot collected in the flue taking fire, and becoming red hot, when it ignited the wood-work in the roof. The flue, or pipe, was of iron.

From a return made by Mr. Braidwood of the houses and properties destroyed in the metropolis in the three years ending in 1849 inclusive, it appears that the total number was 1111 : of contents destroyed (which, being generally insured separately, should be kept distinct) there were 1013. The subjoined table gives the particulars as to the proportion insured and uninsured :—

——	Insured.	Uninsured.	Total.
Houses . . .	914	197	1111
Contents . .	609	404	1013
	1523	601	2124

"The proportion per cent. of the uninsured to the insured, would be—

——		Insured.	Uninsured.	Total.
		Per Cent.	Per Cent.	
Houses . .	1111	82·3	17·7	100
Contents .	1013	60·1	39·9	100
	2124	71·7	28·3	100

The following table gives the total number of fires in the metropolis during a series of years :

ABSTRACT OF CAUSES OF FIRE IN THE METROPOLIS, from 1833 to 1849, inclusive.

Compiled by W. Baddeley.

	1833	1834	1835	1836	1837	1838	1839	1840	1841	1842	1843	1844	1845	1846	1847	1848	1849	Total.	Average

Here, then, we perceive that there are, upon an average of 17 years, no less than 770 "fires" per annum, that is to say, 29 houses in every 10,000 are discovered to be on fire every year; and about one-fourth of these are uninsured. In the year 1833 the total number of fires was only 458, or 20 in every 10,000 inhabited houses, whilst, in 1849, the number had gradually progressed to 838, or 28 in every 10,000 houses.

We have here, however, to deal more particularly with the causes of these fires, of which the following table gives the result of many years' valuable experience :—

TABULAR EPITOME OF METROPOLITAN FIRES, FROM 1833 to 1849.

BY W. BADDELEY, 29, ALFRED STREET, ISLINGTON.

	1833	1834	1835	1836	1837	1838	1839	1840	1841	1842	1843	1844	1845	1846	1847	1848	1849	Total.	Average
Slightly damaged	292	338	315	397	357	383	402	451	438	521	489	502	431	576	536	509	582	6,574	470
Seriously damaged	135	116	125	134	122	152	165	204	234	224	231	237	244	238	273	269	228	2,955	211
Totally destroyed	31	28	31	33	22	33	17	26	24	24	29	23	32	20	27	27	28	365	26
Total No. of Fires	458	482	471	564	501	568	584	681	696	769	749	762	707	834	836	805	838	9,894	770
False Alarms	59	63	66	66	89	80	70	84	67	61	79	70	81	119	88	120	76	1,150	82
Alarms from Chimneys on Fire	75	106	106	126	127	107	101	98	92	82	83	94	87	69	66	86	89	1,307	94
Total No. of Calls	592	651	643	756	717	755	755	863	855	912	911	926	875	1022	990	1011	1003	12,351	882
Insuran. on Building and Contents	..	..	..	169	173	161	169	237	343	321	276	313	313	302	263	310	368	3,718	266
Insurances on Building only ..	..	..	..	73	47	59	58	92	149	116	124	130	107	137	125	120	163	1,508	106
Insurances on Contents only..	..	..	..	104	76	128	115	104	52	112	107	94	73	125	157	134	72	1,453	104
Uninsured	..	..	..	218	205	220	242	248	152	220	242	217	214	270	291	241	235	3,215	230

Thus we perceive that, out of an average of 665 fires per annum, the information being derived from 17 years' experience, the following were the number of fires produced by different causes :—

	Average No. of Fires per Annum.
Candles, various accidents with .	169
Flues, foul, defective, &c. . . .	75
Unknown	63
Gas	46
Stoves over-heated	37
Linen, drying, airing, &c. . . .	30
Accidents of various kinds, for the most part unavoidable	27
Fire heat, application of, to various hazardous manufacturing processes . .	26
Fire sparks	21
Shavings, loose, ignited	20
Carelessness, palpable instances of .	18
Furnaces, kilns, &c., defective or overheated	16
Children playing with fire or candles .	14
Tobacco smoking	14
Spontaneous combustion	13
Wilful	12
Lucifer-matches	11
Ovens	7
Fires, kindled on hearths and other improper places	7
Suspicious	7
Lamps	5
Drunkenness	5
Lime, slaking of	4
Apparel, ignited on the person . .	4
Fireworks	4
Hot cinders put away	3
Incautious fumigation	3
Reading, working, or smoking in bed .	1·33
Hearths defective	1·25
	665

Here, then, we find that while the greatest proportion of fires are caused by accidents with candles, about one-ninth of the fires above mentioned arise from foul flues, or 75 out of 665, a circumstance which teaches us the usefulness of the class of labourers of whom we have been lately treating.

It would seem that a much larger proportion of the fires are wilfully produced than appear in the above table.

The Board of Health, in speaking of incendiarism in connection with insurance, report :—

"Inquiries connected with measures for the improvement of the population have developed the operation of insurances, in engendering crimes and calamities; negatively, by weakening natural responsibilities and motives to care and forethought; positively, by temptations held out to the commission of crime in the facility with which insurance money is usually obtainable.

"The *steady increase* in the number of fires in the metropolis, whilst our advance in the arts gives means for their diminution, is ascribable mainly to the operation of these two causes, and to the division and weakening of administrative authority. From information on which we can rely, we feel assured that the crime of incendiarism for the sake of insurance money exists to a far greater extent than the public are aware of."

Mr. Braidwood has expressed his opinion that only one-half of the property in the metropolis is insured, not as to numbers of property, but as to value; but the proportion of insured and uninsured houses could not be ascertained.

Mr. Baddeley, the inspector to the Society for the Protection of Life from Fire, who had given attention to the subject for the last 30 years, gave the Board the following account of the increase of fires :—

—	Fires per Annum of Houses and Properties.	Of which were Totally Uninsured.	Proportion per Cent. of Insured Houses and Properties Burnt.
In the first seven years there were on an average .	623	215	65·15
In the second seven years . .	790	244	69·3

During this period there has been a great increase in the number of dwellings, but this has been chiefly in suburban places, where fires rarely occur.

"The frequency of fires," it is further stated, "led Mr. Payne, the coroner of the City of London, to revive the exercise of the coroner's function of inquiring into the causes of fires; most usefully. Out of 58 inquests held by him (in the City of London and the borough of Southwark, which comprise only one-eighteenth of the houses of the metropolis) since 1845, it appears that, 8 were proved to be wilful; 27 apparently accidental; and 23 from causes unknown, including suspicious causes. The proportion of ascertained wilful fires was, therefore, 23 per cent.; which gives strong confirmation to the indications presented by the statistical returns as to the excess of insured property burnt above uninsured."

The at once mean and reckless criminality of arson, by which a man exposes his neighbours to the risk of a dreadful death, which he himself takes measures to avoid, has long, and on many occasions, gone unpunished in London. The insurance companies, when a demand is made upon them for a loss through fire, institute an inquiry, carried on quietly by their own people. The claimant is informed, if sufficient reasons for such a step appear, that from suspicious circumstances, which had come to the knowledge of the company, the demand would not be complied with, and that the company would resist any action for the recovery of the money. The criminal becomes alarmed, he is afraid of committing himself, and so the matter drops, and the insurance companies, not being required to pay the indemnification, are satisfied to save their money, and let the incendiarism remain unnoticed or unpunished. Mr. Payne, the coroner, has on some occasions strongly commented on this practice as one which showed the want of a public prosecutor.

A few words as regards the means of extinction and help at fires.

Upwards of two years ago the Commissioners of Police instructed their officers to note the time which elapsed between the earliest alarm of fire and the arrival of the first engine. Seventeen fires were noted, and the average duration of time before the fire-brigade or any parochial or local fire-engine, reached the spot, was 36 minutes. Two or three of these fires were in the suburbs; so that in this crowded city, so densely packed with houses and people, fifteen fires raged unchecked for more than half-an-hour.

There are in the metropolis, not including the more distant suburbs, 150 public fire stations, with engines provided under the management of the parochial authorities. The fire-brigade has but seventeen stations on land, and two on the river, which are, indeed, floating engines, one being usually moored near Southwark-bridge, the other having no stated place, being changed in its locality, as may be considered best. In the course of three years, the term of the official inquiry, the engines of the fire-brigade reached on the average the place where a fire was raging *thirty-five* times as the earliest means of assistance, when the parochial engines did the same only in the proportion of *two* to the thirty-five.

Mr. Braidwood, the director of the fire-brigade, stated, when questioned on the subject with a view to a report to be laid before Parliament, that "the average time of an engine turning out with horses was from three to seven minutes." The engines are driven at the rate of ten miles an hour along the streets, which, in the old coaching days, was considered the "best royal mail pace." Indeed, there have been frequent complaints of the rapidity with which the fire-engines are driven, and if the drivers were not skilful and alert, it would really amount to recklessness.

"Information of the breaking out of a fire," it is stated in the report, "will be conveyed to the station of the brigade at the rate of about five miles an hour: thus in the case of the occurrence of a fire within a mile of the station, the intelligence may be conveyed to the station in about twelve minutes; the horses will be put to, and the engine got out into the street in about five minutes on the average; it traverses the mile in about six minutes; and the water has to be got into the engine, which will occupy about five minutes, making, under the most favourable circumstances for such a distance, 28 minutes, or for a half-mile distance, an average of not less than 20 minutes."

The average distance of the occurring fires from a brigade station were, however, during a period of three years, terminating in 1850, upwards of a mile. One was five miles, several four miles, more were two miles, and a mile and a half, while the most destructive fires were at an average distance of a mile and three quarters. Thus it was impossible for a fire-brigade to give assistance as soon as assistance was needed, and, under other circumstances, might have been rendered. And all this damage may and does very often result from what seems so trifling a neglect as the non-sweeping of a chimney.

Mr. W. Baddeley, an engineer, and a high authority on this subject, has stated that he had attended fires for 30 years in London, and that, of 838 fires which took place in 1849, two-thirds might have been easily extinguished had there been an immediate application of water. In some places, he said, delay originated from the turncocks being at wide intervals, and some of the

Original from HARVARD UNIVERSITY

companies objecting to let any but their own servants have the command of the main-cocks.

The Board of Health have recommended the formation of a series of street-water plugs within short distances of each other, the water to be constantly on at high pressure night and day, and the whole to be under the charge of a trained body of men such as compose the present fire-brigade, provided at appointed stations with every necessary appliance in the way of hose, pipes, ladders, &c. "The hose should be within the reach," it is urged in the report, "fixed, and applied on an average of not more than five minutes from the time of the alarm being given; that is to say, in less than one-fourth of the time within which fire-engines are brought to bear under existing arrangements, and with a still greater proportionate diminution of risks and serious accidents."

Nor is this mode of extinguishing fires a mere experiment. It is successfully practised in some of the American cities, Philadelphia among the number, and in some of our own manufacturing towns. Mr. Emmott, the engineer and manager of the Oldham Water-works, has described the practice in that town on the occurrence of fires:—

"In five cases out of six, the hose is pushed into a water-plug, and the water thrown upon a building on fire, for the average pressure of water in this town is 146 feet; by this means our fires are generally extinguished even before the heavy engine arrives at the spot. The hose is much preferred to the engine, on account of the speed with which it is applied, and the readiness with which it is used, for one man can manage a hose, and throw as much water on the building on fire as an engine worked by many men. On this account we very rarely indeed use the engines, as they possess no advantage whatever over the hose."

When the city of Hamburgh was rebuilt two or three years back, after its destruction by fire, it was rebuilt chiefly under the direction of Mr. W. Lindley, the engineer, and, as far as Mr. Lindley could accomplish, on sanitary principles, such as the abolition of cesspools. The arrangements for the surface cleansing of the streets by means of the hose and jet and the water-plugs, are made available for the extinction of fires, and with the following results, as communicated by Mr. Lindley:—

"Have there been fires in buildings in Hamburgh in the portion of the town rebuilt?—Yes, repeatedly. They have all, however, been put out at once. If they had had to wait the usual time for engines and water, say 20 minutes or half an hour, these might all have led to extensive conflagrations.

"What has been the effect on insurance?—The effect of the rapid extinction of fires has brought to light to the citizens of Hamburgh, the fact that the greater proportion of their fires are the work of incendiaries, for the sake of the insurance money. A person is absent; smoke is seen to exude; the alarm of fire is given, and the door is forced open, the jet applied, and the fire extinguished immediately. Case after case has occurred, where, upon the fire being extinguished, the arrangements for the spread of the fire are found and made manifest. Several of this class of incendiaries for the insurance money are now in prison. The saving of money alone, by the prevention of fires, would be worth the whole expense of the like arrangement in London, where it is well known that similar practices prevail extensively."

The following statement was given by Mr. Quick, an engineer, on this subject:—

"After the destruction of the terminus of the South Western Railway by fire, I recommended them to have a 9-inch main, with 3-inch outlets leading to six stand-pipes, with joining screws for hose-pipes to be attached, and that they should carry a 3-inch pipe of the same description up into each floor, so that a hose might be attached in any room where the fire commenced.

"In how many minutes may the hose be attached?—There is only the time of attaching the hose, which need be nothing like a minute. I have indeed recommended that a short length of hose with a short nozzle or branch should be kept attached to the cock, so that the cock has only to be turned, which is done in an instant.

"It appears that fire-engines require 26 men to work each engine of two 7-inch barrels, to produce a jet of about 50 feet high. The arrangement carried out, at your recommendation, with six jets, is equivalent to keeping six such engines, and the power of 156 men, in readiness to act at all times, night and day, at about a minute's notice, for the extinction of fires?—It will give a power more than equal to that number of men; for the jets given off from a 20-inch main will be much more regular and powerful, and will deliver more water than could be delivered by any engine. The jets at that place would be 70 feet high."

The system of roof-cisterns, which was at one time popular as a means of extinction, has been found, it appears, on account of their leakage and diffusion of damp, to be but sorry contrivances, and have very generally been discontinued. Mr. Holme, a builder in Liverpool, gives the following, even under the circumstances, amusing account of a fire where such a cistern was provided:—

"The owner of a cotton kiln, which had been repeatedly burnt, took it into his head to erect a large tank in the roof. His idea was, that when a fire occurred, they should have water at hand; and when the fire ascended, it would burn the wooden tank, and the whole of the contents being discharged on the fire like a cataract, it would at once extinguish it. Well, the kiln again took fire; the smoke was so suffocating, that nobody could get at the internal pipe, and the whole building was again destroyed. But what became of the tank? It could not burn, because it was filled with water; consequently, it boiled most admirably. No hole was singed in its side or bottom; it looked very picturesque, but it was utterly useless."

The necessity of almost immediate help is

Original from HARVARD UNIVERSITY

shown in the following statement by Mr. Braidwood, when consulted on the subject of fire-escapes, which under the present system are not considered sufficiently effective:—

"Taking London to be six miles long and three miles broad, to have anything like an efficient system of fire-escapes, it would be necessary to have one with a man to attend it within a quarter of a mile of each house, as assistance, to be *of any use, must generally be rendered within five minutes after the alarm is given.* To do this the stations must be within a quarter of a mile of each other (as the escapes must be taken round the angles of the streets): 253 stations would thus be required and as many men.

"At present scaling ladders are kept at all the engine stations, and canvas sheets also at some of them; several lives have been saved by them; but the distance of the stations from each other renders them applicable only in a limited number of instances."

The engines of the fire-brigade throw up about 90 gallons a minute. Their number is about 100. The cost of a fire-engine is from 60*l.* to 100*l.*, and the hose, buckets, and general apparatus, cost nearly the same amount.

Of the Sewermen and Nightmen of London.

We now come to the consideration of the last of the several classes of labourers engaged in the removal of the species of refuse from the metropolis. I have before said that the public refuse of a town consists of two kinds:—

I. The street-refuse.
II. The house-refuse.

Of each of these kinds there are two species:—

A. The dry.
B. The wet.

The dry street-refuse consists, as we have seen, of the refuse earth, bricks, mortar, oyster-shells, potsherds, and pansherds.

And the dry house-refuse of the soot and ashes of our fires.

The wet street-refuse consists, on the other hand, of the mud, slop, and surface water of our public thoroughfares.

And the wet house-refuse, of what is familiarly known as the "slops" of our residences, and the liquid refuse of our factories and slaughter-houses.

We have already collected the facts in connection with the three first of these subjects. We have ascertained the total amount of each of these species of refuse which have to be annually removed from the capital. We have set forth the aggregate number of labourers who are engaged in the removal of it, as well as the gross sum that is paid for so doing, showing the individual earnings of each of the workmen, and arriving, as near as possible, at the profits of their employers, as well as the condition of the employed. This has been done, it is believed, for the first time in this country; and if the subject has led us into longer discussions than usual, the importance of the matter, considered in a sanitary point of view, is such that a moment's reflection will convince us of the value of the inquiry—especially in connection with a work which aspires to embrace the whole of the offices performed by the labourers of the capital of the British Empire.

It now but remains for us to complete this novel and vast inquiry by settling the condition and earnings of the men engaged in the removal of the last species of public refuse. I shall consider, first, the aggregate quantity of wet house-refuse that has to be annually removed; secondly, the means adopted for the removal of it; thirdly, the cost of so doing; and lastly, the number of men engaged in this kind of work, as well as the wages paid to them, and the physical, intellectual, and moral condition in which they exist, or, more properly speaking, are allowed to remain.

Of the Wet House-Refuse of London.

All house-refuse of a liquid or semi-liquid character is *wet* refuse. It may be called semi-liquid when it has become mingled with any solid substance, though not so fully as to have lost its property of fluidity, its natural power to flow along a suitable inclination.

Wet house-refuse consists of the "slops" of a household. It consists, indeed, of *all* waste water, whether from the supply of the water companies, or from the rain fall collected on the roofs or yards of the houses; of the "suds" of the washerwomen, and the water used in every department of scouring, cleansing, or cooking. It consists, moreover, of the refuse proceeds from the several factories, dye-houses, &c.; of the blood and other refuse (not devoted to Prussian blue manufacture or sugar refining) from the butchers' slaughter-houses and the knackers' (horse slaughterers') yards; as well as the refuse fluid from all chemical processes, quantities of chemically impregnated water, for example, being pumped, as soon as exhausted, from the tan-pits of Bermondsey into the drains and sewers. From the great hat-manufactories (chiefly also in Bermondsey and other parts of the Borough) there is a constant flow of water mixed with dyes and other substances, to add to the wet refuse of London.

It is evident, then, that *all* the water consumed or wasted in the metropolis must form a portion of the total sum of the wet refuse.

There is, however, the exception of what is used for the watering of gardens, which is absorbed at once by the soil and its vegetable products; we must also exclude such portion of water as is applied to the laying of the road and street dust on dry summer days, and which forms a part of the street mud or "mac" of the scavager's cart, rather than of the sewerage; and we must further deduct the water derived from the street plugs for the supply of the fire-engines, which is consumed or absorbed in the extinction of the flames; as well as the water required for the victualling of ships on the eve of a voyage,

when such supply is not derived immediately from the Thames.

The quantity of water required for the diet, or beverage, or general use of the population; the quantity consumed by the maltsters, distillers, brewers, ginger-beer and soda-water makers, and manufacturing chemists; for the making of tea, coffee, or cocoa; and for drinking at meals (which is often derived from pumps, and not from the supplies of the water companies);—the water which is thus consumed, in a prepared or in a simple state, passes into the wet refuse of the metropolis in another form.

Now, according to reports submitted to Parliament when an improved system of water-supply was under consideration, the daily supply of water to the metropolis is as follows:—

	Gallons.
From the Water Companies .	44,383,329
„ „ Artesian Wells . .	8,000,000
„ „ land spring pumps .	3,000,000
	55,383,329

The yearly rain-fall throughout the area of the metropolis is 172,053,477 tons, or 33,589,972,120 gallons, 2 feet deep of rain falling on every square inch of London in the course of the year. The yearly total of the water pumped or falling into the metropolis is as follows:—

	Gallons.
Yearly mechanical supply .	19,215,000,000
„ natural ditto . .	38,539,972,122
	57,754,972,122

The reader will find the details of this subject at p. 203 of the present volume. I recapitulate the results here to save the trouble of reference, and briefly to present the question under one head.

Of course the rain which ultimately forms a portion of the gross wet refuse of London, can be only such as falls on that part of the metropolitan area which is occupied by buildings or streets. What falls upon fields, gardens, and all open ground, is absorbed by the soil. But a large proportion of the rain falling upon the streets, is either absorbed by the dry dust, or retained in the form of mud; hence that only which falls on the house-tops and yards can be said to contribute largely to the gross quantity of wet refuse poured into the sewers. The streets of London appear to occupy one-tenth of the entire metropolitan area, and the houses (estimating 300,000 as occupying upon an average 100 square yards each*) another tithe of the surface. The remaining 92 square miles out of the 115 now included in the Registrar-General's limits (which extend, it should be remembered, to Wandsworth, Lewisham, Bow, and Hampstead), may be said to be made up of suburban gardens, fields, parks, &c., where the rain-water would soak into the earth. We have, then, only two-tenths of the gross rain-fall, or 7,700,000,000 gallons, that could possibly appear in the sewers, and calculating one-third of this to be absorbed by the mud and dust of the streets, we come to the conclusion that the total quantity of rain-water entering the sewers is, in round numbers, 5,000,000,000 gallons per annum.

Reckoning, therefore, 5,000,000,000 gallons to be derived from the annual rain-fall, it appears that the yearly supply of water, from all sources, to be accounted for among the wet house-refuse is, in round numbers, 24,000,000,000 gallons.

The refuse water from the factories need not be calculated separately, as its supply is included in the water mechanically supplied, and the loss from evaporation in boiling, &c., would be perfectly insignificant if deducted from the vast annual supply, but 350,000,000 gallons have been allowed for this and other losses.

There is still another source of the supply of wet house-refuse unconnected either with the rain-fall or the mechanical supply of water—I mean such proportion of the blood or other refuse from the butchers' and knackers' premises as is washed into the sewers.

Official returns show that the yearly quantity of animals sold in Smithfield is—

Horned cattle	224,000
Sheep	1,550,000
Calves	27,300
Pigs	40,000
	1,841,300

The blood flowing from a slaughtered bullock, whether killed according to the Christian or the Jewish fashion, amounts, on an average, to 20 quarts; from a sheep, to 6 or 7 quarts; from a pig, 5 quarts; and the same quantity from a calf. The blood from a horse slaughtered in a knackers' yard is about the same as that from a bullock. This blood used to bring far higher prices to the butcher than can be now realized.

In the evidence taken by a Select Committee of the House of Commons in 1849, concerning Smithfield-market, Mr. Wyld, of the Fox and Knot-yard, Smithfield, stated that he slaughtered about 180 cattle weekly. "We have a sort of well made in the slaughterhouse," he said, "which receives the blood. I receive about 1*l.* a week for it; it goes twice a day to Mr. Ton's, at Bow Common. We used to receive a good deal more for it." Even the market for blood at Mr. Ton's, is, I am informed, now done away with. He was a manufacturer of artificial manure, a preparation of night-soil, blood, &c., baked in what may be called "cakes," and exported chiefly to our sugar-growing colonies, for manure. His manure yard has been suppressed.

I am assured, on the authority of experienced butchers, that at the present time fully three-fourths of the blood from the animals slaughtered in London becomes a component part of the wet refuse I treat of, being washed into the sewers.

* In East and West London there are rather more than 32 houses to the acre, which gives an average of 151 square yards to each dwelling, so that, allowing the streets here to occupy one-third of the area, we have 100 square yards for the space covered by each house. In Lewisham, Hampstead, and Wandsworth, there is not one house to the acre. The average number of houses per acre throughout London is 4.

Original from HARVARD UNIVERSITY

The more wholesale slaughterers, now that blood is of little value (9 gallons in Whitechapel-market, the blood of two beasts—less by a gallon—can be bought for 3*d.*), send this animal refuse down the drains of their premises in far greater quantities than was formerly their custom.

Now, reckoning only three-fourths of the blood from the cattle slaughtered in the metropolis, to find its way into the sewers, we have, according to the numbers above given, the following yearly supply :—

	Gallons.
From horned cattle	840,000
„ sheep	1,743,000
„ pigs	37,500
„ calves	25,590
	2,646,090

This is merely the blood from the animals sold in Smithfield-market, the lambs not being included in the return; while a great many pigs and calves are slaughtered by the London tradesmen, without their having been shown in Smithfield.

The ordure from a slaughtered bullock is, on an average, from ½ to ¾ cwt. Many beasts yield one cwt.; and cows "killed full of grass," as much as two cwt. Of this excrementitious matter, I am informed, about a fourth part is washed into the sewers. In sheep, calves, and pigs, however, there is very little ordure when slaughtered, only 3 or 4 lbs. in each as an average.

Of the number of horses killed there is no official or published account. One man familiar with the subject calculated it at 100 weekly. *All* the blood from the knackers' yards is, I am told, washed into the sewers; consequently its yearly amount will be 26,000 gallons.

But even this is not the whole of the wet house-refuse of London.

There are, in addition, the excreta of the inhabitants of the houses. These are said to average ¼ lb. daily per head, including men, women, and children.

It is estimated by Bousingault, and confirmed by Liebig, that each individual produces ¼ lb. of solid excrement and 1¼ lb. of liquid excrement per day, making 1½ lb. each, or 150 lbs. per 100 individuals, of semi-liquid refuse from the water-closet. "But," says the Surveyor of the Metropolitan Commission of Sewers, "there is other refuse resulting from culinary operations, to be conveyed through the drains, and the whole may be about 250 lbs. for 100 persons."

The more fluid part of this refuse, however, is included in the quantity of water before given, so that there remains only the more solid excrementitious matter to add to the previous total. This, then, is ¼ lb. daily and individually; or from the metropolitan population of nearly 2,500,000 a daily supply of 600,000 lbs., rather more than 267 tons; and a yearly aggregate for the whole metropolis of 219,000,000 lbs., or very nearly about 100,000 tons.

From the foregoing account, then, the following is shown to be

The Gross Quantity of the Wet House-Refuse of the Metropolis.

	Gallons.		Lbs.
"Slops" and unabsorbed rain-water....	24,000,000,000	=	240,000,000,000
Blood of beasts....	2,646,000	=	26,460,000
„ horses....	26,000	=	260,000
Excreta			219,000,000
Dung of slaughtered cattle			17,400,000
Total	24,002,657,000	=	240,263,120,000

Hence we may conclude that the more fluid portion of the wet house-refuse of London amounts to 24,000,000,000 gallons per annum; and that altogether it weighs, in round numbers, about 240,000,000,000 lbs., or 100,000,000 tons.

As these refuse products are not so much matters of trade or sale as other commodities, of course less attention has been given to them, in the commercial attributes of weight and admeasurement. I will endeavour, however, to present an uniform table of the whole great mass of metropolitan wet house-refuse in cubic inches.

The imperial standard gallon is of the capacity of 277·274 cubic inches; and estimating the solid excrement spoken of as the ordinary weight of earth, or of the soil of the land, at 18 cubic feet the ton, we have the following result, calculating in round numbers :—

Wet House-Refuse of the Metropolis.

Liquid ..	24,000,000,000 gal.	=	6,600,000,000,000 cub. in.
Solid....	100,000 tons	=	3,110,400,000 „

Thus, by this process of admeasurement, we find the

WET HOUSE-REFUSE OF LONDON........ } = 6,603,110,400,000 cubic in., or 3,820,000,000 cubic feet.

Figures best show the extent of this refuse, "inexpressible" to common appreciation "by numbers that have name."

OF THE MEANS OF REMOVING THE WET HOUSE-REFUSE.

WHETHER this mass of filth be, zymotically, the cause of cholera, or whether it be (as cannot be be questioned) a means of agricultural fertility, and therefore of national wealth, it *must* be removed. I need not dilate, in explaining a necessity which is obvious to every man with uncorrupted physical senses, and with the common moral sense of decency.

"Dr. Paley," it is said, in a recent Report to the Metropolitan Commission of Sewers, "gave to Burckhardt and other travellers a set of instructions as to points of observation of the manners and conditions of the populations amongst whom they travelled. One of the leading instructions was to observe how they disposed of their excreta, for what they did with that showed him what men were; he also inquired what structure they had to answer the purpose of a privy, and what were their habits in respect to it. This information Dr Paley desired, not for popular use, but for himself, for he was accustomed to say, that the facts connected with that topic gave him more

Original from HARVARD UNIVERSITY

information as to the real condition and civilisation of a population than most persons would be aware of. It would inform him of their real habits of cleanliness, of real decency, self-respect, and connected moral habits of high social importance. It would inform him of the real state of police, and of local administration, and much of the general government.

"The human ordure which defiles the churches, the bases of public edifices and works of art in Rome and Naples, and the Italian cities, gives more sure indications of the real moral and social position of the Italian population than any impressions derived from the edifices and works of art themselves.

"The subject, in relation to which the Jewish lawgiver gave most particular directions, is one on which the serious attention and labour of public administrators may be claimed."

The next question, is—*How* is the wet house-refuse to be removed?

There are two ways:—

1. One is, to transport it to a river, or some powerfully current stream by a series of ducts.
2. The other is, to dig a hole in the neighbourhood of the house, there collect the wet refuse of the household, and when the hole or pit becomes full, remove the contents to some other part.

In London the most obvious means of getting rid of a nuisance is to convey it into the Thames. Nor has this been done in London only. In Paris the Seine is the receptacle of the sewage, but, comparatively, to a much smaller extent than in London. The fæcal deposits accumulated in the houses of the French capital are drained into "fixed" and "moveable" cesspools. The contents of both these descriptions of cesspools (of which I shall give an account when I treat of the cesspool system) are removed periodically, under the direction of the government, to large receptacles, called *voiries*, at Montfaucon, and the Forest of Bondy, where such refuse is made into portable manure. The evils of this system are not a few; but the river is spared the greater pollution of the Thames. Neither is the Seine swayed by the tide as is the Thames, for in London the very sewers are affected by the tidal influence, and are not to be entered until some time before or after high-water. I need not do more, for my present inquiry, than allude to the Liffy, the Clyde, the Humber, and others of the rivers of the United Kingdom, being used for purposes of sewerage, as channels to carry off that of which the law prohibits the retention.

Of the folly, not to say wickedness, of this principle, there can be no doubt. The vegetation which gives, demands food. The grass will wither without its fitting nutriment of manure, as the sheep would perish without the pasturage of the grass. Nature, in temperate and moist climates, is, so to speak, her own manurer, her own restorer. The sheep, which are as wild and active as goats, manure the Cumberland fells in which they feed. In the more cultivated sheep-walks (or, indeed, in the general pasturage) of the northern and some of the midland counties, women, with a wooden implement, may be continually seen in the later autumn, or earlier and milder winter, distributing the "stercoraceous treasure," as Cowper calls it, which the animals, to use the North Yorkshire word, have "dropped," as well as any extraneous manure which may have been spread for the purpose. As population and the demand for bread increase, the need of extraneous manures also increases; and Nature in her beneficence has provided that the greater the consumption of food, the greater shall be the promoters of its reproduction by what is loathsome to man, but demanded by vegetation. Liebig, as I shall afterwards show more fully, contends that many an arid and desolate region in the East, brown and burnt with barrenness, became a desolation because men understood not the restoration which all nature demands for the land. He declares that the now desolate regions of the East had been made desolate, because "the inhabitants did not understand the art of restoring exhausted soil." It would be hopeless now to form, or attempt to form, the "hanging gardens," or to display the rich florescence "round about Babylon," to be seen when Alexander the Great died in that city. The Tigris and Euphrates, before and after their junction, Liebig maintains, have carried, and, to a circumscribed degree, still carry, into the sea "a sufficient amount of manure for the reproduction of food for millions of human beings." It is said that, "could that matter only be arrested in its progress, and converted into bread and wine, fruit and beef, mutton and wool, linen and cotton, then cities might flourish once more in the desert, where men are now digging for the relics of primitive civilization, and discovering the symbols of luxury and ease beneath the barren sand and the sunburnt clay."

This is one great evil; but in our metropolis there is a greater, a far greater, beyond all in degree, even if the same abuse exist elsewhere. What society with one consent pronounces filth—the evacuations of the human body—is not only washed into the Thames, and the land so deprived of a vast amount of nutriment, but the tide washes these evacuations back again, with other abominations. The water we use is derived almost entirely from the Thames, and therefore the water in which we boil our vegetables and our meat, the water for our coffee and tea, the water brewed for our consumption, comes to us, and is imbibed by us, impregnated over and over again with our own animal offal. We import guano, and drink a solution of our own fæces: a manure which might be made far more valuable than the foreign guano.

Such are a few of the evils of making a common sewer of the neighbouring river.

The other mode of removal is, to convey the wet house-refuse, by drains, to a hole near the house where it is produced, and empty it periodically when full.

The house-drainage throughout London has two characteristics. By one system all excrementitious and slop refuse generally is carried usually along

Original from HARVARD UNIVERSITY

brick drains from the water-closets, privies, sinks, lavatories, &c., of the houses into the cesspools, where it accumulates until its removal (by manual labour) becomes necessary, which is not, as an average, more than once in two years. By the other, and the newer system, all the house-refuse is drained into the public sewer, the cesspool system being thereby abolished. All the houses built or rebuilt since 1848 are constructed on the last-mentioned principle of drainage.

The first of these modes is cesspoolage.

The second is sewerage.

I shall first deal with the sewerage of the metropolis.

OF THE QUANTITY OF METROPOLITAN SEWAGE.

HAVING estimated the gross quantity of wet house-refuse produced throughout London in the course of the year, and explained the two modes of removing it from the immediate vicinity of the house, I will now proceed to set forth the *quantity* of wet house-refuse matter which it has been *ascertained* is removed with the contents of London sewers.

An experiment was made on the average discharge of sewage from the outlets of Church-lane and Smith-street, Chelsea, Ranelagh, King's Scholar's-pond, Grosvenor-wharf, Horseferry-road, Wood-street, King-street, Northumberland-street, Durham-yard, Norfolk-street, and Essex-street (the four last-mentioned places running from the Strand). The experiments were made "under ordinary and extraordinary circumstances," in the months of May, June, and July, 1844, but the system is still the same, so that the result in the investigation as to the sewage of the year 1844 may be taken as a near criterion of the present, as regards the localities specified and the general quantity.

The surface drained into the outlets before enumerated covers, in its total area, about 7000 acres, of which nearly 3500 may be classed as urban. The observations, moreover, were made generally during fine weather.

I cannot do better by way of showing the reader the minuteness with which these observations were made, than by quoting the two following results, being those of the fullest and smallest discharges of twelve issues into the river. I must premise that these experiments were made on seven occasions, from May 4 to July 12 inclusive, and made at different times, but generally about eight hours after high water. In the Northumberland-street sewer, from which was the largest issue, the width of the sewer at the outlet was five feet. In the King-street sewer (the smallest discharge, as given in the second table) the width of the sewer was four feet. The width, however, does not affect the question, as there was a greater issue from the Norfolk-street sewer of two feet, than from the King-street sewer of four feet in width.

NORTHUMBERLAND STREET.

Date.	Velocity per second.	Quantity discharged per second.
	Feet.	Cubic Feet.
May 4 .	4·600	10·511000
" 9 .	4·000	6·800000
June 5 .	4·000	6·800000
" 10 .	4·600	10·350000
" 11 .	4·920	12·300000

July 12 .	2·760	3·394800
		56·095800
Being Mean Discharge per second		8·013685
Ditto per 24 hours . .		692382·

KING STREET.

Date.	Velocity per second.	Quantity discharged per second.
May 4 .	·147	·021756
" 9 .	·333	·079920
June 5 .	·170	·020400
" 10 .	·311	·064688
" 11 .	·300	·048000
" 16 .	·101	·004040
July 12 .	·103	·008240
		·247044
Mean Discharge per second .		·035292
Ditto per 24 hours		3049·

Here we find that the mean discharge per second was, from the Northumberland-street sewer, 692,382· cubic feet per 24 hours, and from the King-street sewer, 3049 cubic feet per 24 hours.

The discharge from the principal outlets in the Westminster district "being the mean of seven observations taken during the summer," was 1,798,094 cubic feet in 24 hours; the number of acres drained was 7006. *The mean discharge per acre, in the course of 24 hours, was found to be about 256 cubic feet, comprising the urban and suburban parts.*

The sewage, from the discharge of which this calculation was derived—and the dryness of the weather must not be lost sight of—may be fairly assumed as derived (in a dry season) almost entirely from artificial sources or house drainage, as there was no rain-fall, or but little. "*Supposing, therefore,*" the Report states, "*the entire surface to be urban, we have 540 cubic feet as the mean daily discharge per acre.* If, however, the average be taken of the first eight outlets, viz., from Essex-street to Grosvenor-wharf inclusive, which drain a surface wholly urban, the result is 1260 cubic feet per acre in the 24 hours. This excess may be attributed to the number of manufactories, and the densely-populated nature of the locality drained; but, as indicative of the general amount of sewage due to ordinary urban districts, the former ought perhaps to be considered the fairer average."

Original from HARVARD UNIVERSITY

It is then assumed—I may say officially—that the average discharge of the urban and suburban sewage from the several districts included within an area of 58 square miles, is equal to 256 cubic feet per acre.

	Sq. Miles.
The extent of the jurisdiction included within this area is, on the north side of the Thames	43
And on the Surrey and Kent side .	15

	Cubic Feet.
The ordinary *daily* amount of sewage discharged into the river on the north side is, therefore . .	7,045,120
And on the south side. . .	2,457,600
Making a total of . . .	9,502,720

Or a quantity equivalent to a surface of more than 36 acres in extent, and 6 feet in depth.

This mass of sewage, it must be borne in mind, is but the *daily* product of the sewage of the more populous part of the districts included within the jurisdiction of the two commissions of sewers.

The foregoing observations, calculations, and deductions have supplied the basis of many scientific and commercial speculations, but it must be remembered that they were taken between seven and eight years ago. The observations were made, moreover, during fine summer weather, generally, while the greatest discharge is during rainy weather. There has been, also, an increase of sewers in the metropolis, because an increase of streets and inhabited houses. The approximate proportion of the increase of sewers (and there is no precise account of it) is pretty nearly that of the streets, lineally. Another mattter has too, of late years, added to the amount of sewage—the abolition of cesspoolage in a considerable degreee, owing to the late Building and Sanitary Acts, so that fœcal and culinary matters, which were drained into the cesspool (to be removed by the nightmen), are now drained into the sewer. Altogether, I am assured, on good authority, the daily discharge of the sewers extending over 58 square miles of the metropolis may be now put at 10,000,000 cubic feet, instead of rather more than nine and a half millions. And this gives, as

	Cubic Feet.
The annual amount of discharge from the sewers	3,650,000,000
The total amount of wet house-refuse, according to the calculation before given, is	3,820,000,000
Hence there remains .	170,000,000

	Sq. Miles.
Now it will be seen that the total area from which this amount of sewage is said to be drained is	58
But the area of London, according to the Registrar-General's limits, is . .	115

So that the 3,650,000,000 cubic feet of sewage annually removed from 58 square miles of the metropolis refer to only one-half of the entire area of the *true* metropolis; but it refers, at the same time, to that part of London which is the most crowded with houses, and since, in the suburbs, the buildings average about 2 to the acre, and, in the densest parts of London, about 30, it is but fair to assume that the refuse would be, at least, in the same proportion, and this is very nearly the fact; for if we suppose the 58 miles of the suburban districts to yield twenty times less sewage than the 58 miles of the urban districts, we shall have 182,500,000 cubic feet to add to the 3,650,000,000 cubic feet before given, or 3,832,500,000 for the sewage of the entire metropolis.

It does not appear that the sewage has ever been weighed so as to give any definite result, but calculating from the weight of water (a gallon, or 10 lbs. of water, comprising 277·274 cubic inches, and 1 ton of liquid comprising 36 cubic feet) the total, from the returns of the investigation in 1844, would be

	Tons.
Quantity of sewage *daily* emptied into the Thames	278,000
Ditto Annually . . .	101,390,000

In September, 1849, Mr. Banfield, at one time a Commissioner of Sewers, put the yearly quantity of sewage discharged into the Thames at 45,000,000 tons; but this is widely at variance with the returns as to quantity.

Of Ancient Sewers.

The traverser of the London streets rarely thinks, perhaps, of the far extended subterranean architecture below his feet; yet such is indeed the case, for the sewers of London, with all their imperfections, irregularities, and even absurdities, are still a great work; certainly not equal, in all respects, to what once must have existed in Rome, but second, perhaps, only to the giant works of sewerage in the eternal city.

The origin of these Roman sewers seems to be wrapped in as great a mystery as the foundation of the city itself. The statement of the Roman historians is that these sewers were the works of the elder Tarquin, the fifth (apocryphal) king of Rome. Tarquin's dominions, from the same accounts, did not in any direction extend above sixteen miles, and his subjects could be but banditti, foragers, and shepherds. One conjecture is, that Rome stands on the site of a more ancient city, and that to its earlier possessors may be attributed the work of the sewers. To attribute them to the rudeness and small population of Tarquin's day, it is contended, is as feasible as it would be to attribute the ruins of ancient Jerusalem, or any others in Asia Minor, to the Turks, or the ruins of Palmyra to the Arabs, because these people enjoy the privilege of possession.

The main sewer of Rome, the Cloaca Maxima, is said to have been lofty and wide enough for a waggon load of hay to pass clear along it. Another, and more probable account, however, states that it was proposed to *enlarge* the great sewer to these dimensions, but it does not appear to have been so enlarged. Indeed, when Augustus "made

Rome marble," it was one of his great works also, under the direction of Agrippa, to reconstruct, improve, and enlarge the sewers. It was a project in the days of Rome's greatness to turn seven navigable rivers into vast subterraneous passages, larger sewers, along which barges might pass, carrying on the traffic of Imperial Rome. In one year the cost of cleansing, renewing, and repairing the sewers is stated to have been 1000 talents of gold, or upwards of 192,000*l*. Of the *average* yearly cost we have no information. Some accounts represent these sewers as having been rebuilt after the irruption of the Gauls. In Livy's time they were pronounced not to be accommodated to the plan of Rome. Some portions of these ancient structures are still extant, but they seem to have attracted small notice even from professed antiquarians; their subterranean character, however, renders such notice little possible. In two places they are still kept in repair, and for their original purpose, to carry off the filth of the city, but only to a small extent.

Our legislative enactments on the subject of sewers are ancient and numerous. The oldest is that of 9 Henry III., and the principal is that of 23 Henry VIII., commonly called the "Statute of Sewers." These and many subsequent statutes, however, relate only to watercourses, and are silent as regards my present topic—the Refuse of London.

It is remarkable how little is said in the London historians of the *sewers*. In the two folio volumes of the most searching and indefatigable of all the antiquarians who have described the old metropolis, John Stow, the tailor, there is no account of what we now consider sewers, inclosed and subterranean channels for the conveyance of the refuse filth of the metropolis to its destination—the Thames. Had covered sewers been known, or at any rate been at all common, in Stow's day, and he died full of years in 1604, and had one of them presented but a crumbling stone with some heraldic, or apparently heraldic, device at its outlet, Stow's industry would certainly have ferreted out some details. Such, however, is not the case.

This absence of information I hold to be owing to the fact that no such sewers then existed. Our present system of sewerage, like our present system of street-lighting, is a modern work; but it is not, like our gas-lamps, an *original* English work. We have but followed, as regards our arched and subterraneous sewerage, in the wake of Rome.

As I have said, the early *laws* of sewers relate to watercourses, navigable communications, dams, ditches, and such like; there is no doubt, however, that in the heart of the great towns the filth of the houses was, by rude contrivances in the way of drainage, or natural fall, emptied into such places. Even in the accounts of the sewers of ancient Rome, historians have stated that it is not easy, and sometimes not possible, to distinguish between the *sewers* and the *aqueducts*, and Dr. Lemon, in his English Etymology, speaks of sewers as a species of aqueducts. So, in some of our earlier Acts of Parliament, it is hardly possible to distinguish whether the provisions to be applied to the management of a sewer relate to a ditch to which house-filth was carried—to a channel of water for general purposes—or to an open channel being a receptacle of filth and a navigable stream at the same time.

That the ditches were not sewers for the conveyance of the filth from the houses to any very great, or rather any very general extent, may very well be concluded, because (as I have shown in my account of the early scavagers) the excrementitious matter was deposited during the night in the street, and removed by the proper functionaries in the morning, or as soon as suited their convenience. Though this was the case generally, it is evident that the filth, or a portion of it, from the houses which were built on the banks of the Fleet River (as it was then called, as well as the Fleet Ditch), and on the banks of the other "brooks," drained into the current stream. The Corporation accounts contain very frequent mention of the cleansing, purifying, and "thorough" cleansing of the Fleet Ditch, the Old Bourne (Holborn Brook), the Wall Brook, &c.

Of all these streams the most remarkable was Fleet Ditch, which was perhaps the first main sewer of London. I give from Stow the following curious account of its origin. It is now open, but only for a short distance, offending the air of Clerkenwell. At one period it was to afford a defence to the City! as the Tower-moat was a defence to the Tower, and fortress.

"The Ditch, which partly now remaineth and compassed the Wall of the City, was begun to be made by the *Londoners*, in the year 1211, and finished 1213, the 15th of K. *John*. This Ditch being then made of 200 foot broad, caused no small hindrance to the Canons of the Holy *Trinity*, whose Church stood near *Ealdgate*, for that the said Ditch passed through their Ground from the *Tower* unto *Bishopsgate*.

"The first Occasion of making a Ditch about the City seems to have been this: *William*, Bishop of *Ely*, Chancellor of *England*, in the Reign of King *Richard* I., made a great Ditch round about the *Tower*, for the better Defence of it against *John* the King's Brother, the King being then out of the Realm. Then did the City also begin a Ditch to encompass and strengthen their Walls [which happened between the Years 1190 and 1193.] So the Book *Dunthorn*. Yet the Register of *Bermondsey* writes that the Ditch was begun, Oct. 15, 1213, which was in the Reign of King *John* that succeeded to *Richard*.

"This Ditch being originally made for the Defence of the City, was also a long time together carefully cleansed and maintained, as Need required; but now of late neglected, and forced either to a very narrow, and the same a filthy Channel.

"In the Year of *Christ*, 1354, 28 *Ed.* 3, the Ditch of this City flowing over the Bank into the *Tower-ditch*, the King commanded the said Ditch of the City to be cleansed, and so ordered, that the overflowing thereof should not force any Filth into the *Tower-ditch*.

"*Anno*, 1379, John Philpot, Maior of *London*,

Original from HARVARD UNIVERSITY

caused this Ditch to be cleansed, and every Houshold to pay 5*d.*, which was a Day's Work toward the Charges thereof.

"*Ralph Joseline*, Maior, 1477, caused the whole Ditch to be cast and cleansed. . . . . . In 1519, the 10th of Henry 8, for cleansing and scouring the common Ditch, between *Aldgate*, and the Postern next the *Tower-ditch;* the chief Ditcher had by the day 7*d.*, the Second Ditcher, 6*d*, the other Ditchers, 5*d.* And every Vagabond (for as they were then termed) 1*d.* the Day, Meat and Drink, at the Charges of the City. Sum 95*l.* 3*s.* 4*d.*

"Fleet Ditch was again cleansed in the Year 1549," Stow continues, "*Henry Ancoates* being Maior, at the Charges of the Companies. And again 1569, the 11th of Queen *Elizabeth;* for cleansing the same Ditch between *Ealdgate* and the *Postern*, and making a new Sewer and Wharf of Timber, from the Head of the *Postern* into the *Tower-ditch*, 814*l.* 15*s.* 8*d.* (was disbursed). Before the which Time the said Ditch lay open, without either Wall or Pall, having therein great Store of very good Fish, of divers Sorts, as many men yet living, who have taken and tasted them, can well witness. But now no such matter, the Charge of Cleansing is spared, and great Profit made by letting out the Banks, with the Spoil of the whole Ditch."

The above information appeared, but I am unable to specify the year (for Stow's works went through several editions, though it is to be feared he died very poor) between 1582 and 1590. So did the following:—

"At this Day there be no Ditches or Boggs in the City except the said *Fleet-ditch*, but instead thereof large common *Dreins* and *Sewers*, made to carry away the water from the *Postern-Gate*, between the two *Tower-hills* to *Fleet-bridge* without *Ludgate*."

Great, indeed, is the change in the character of the capital of England, from the times when the Fleet Ditch was a defence to the city (which was then the entire capital); and from the later era, when "great store of very good fish of divers sorts," rewarded the skill or the patience of the anglers or netters; but this, it is evident, was in the parts near the river (the Tower postern, &c.), and at that time, or about that time, there was salmon-fishing in the Thames, at least as far up as Hungerford Wharf.

The Fleet Ditch seems always to have had a *sewery* character. It was described, in 1728, as

"The king of dykes! than whom no sluice of mud
With deeper sable blots the silver flood—"

the *silver* flood being, in Queen Anne's and the First George's days, the London Thames. This silver has been much alloyed since that time.

Until within these 40 or 50 years, open sewer-ditches, into which drains were emptied, and ordure and refuse thrown, were frequent, especially in the remoter parts of Lambeth and Newington, and some exist to this day; one especially, open for a considerable distance, flowing along the back of the houses in the Westminster-road, on the right-hand side towards the bridge, into which the neighbouring houses are drained. The "Black Ditch," a filthy sewer, until lately was open near the Broadwall, and other vicinities of the Blackfriars-road. The open ditch-sewers of Norwood and Wandsworth have often been spoken of in Sanitary Reports. Indeed, some of our present sewers, in addition to Fleet River and Wall Brook, are merely ditches rudely arched over.

The first covered and continuous street sewer was erected in London—I think, without doubt—when Wren rebuilt the capital, after the great fire of 1666. Perhaps there is no direct evidence of the fact, for, although the statutes and Privy Council and municipal enactments, consequent on the rebuilding of the capital, required, more or less peremptorily, "fair sewers, and drains, and water-courses," it is not defined in these enactments what was meant by a "sewer;" nor were they carried out.

I may mention, as a further proof that open ditches, often enough stagnant ditches also, were the first London sewers, that, after 1666, a plan, originally projected, it appears, by Sir Leonard Halliday, Maior, 60 years previously, and strenuously supported at that time by Nic Leate, "a worthy and grave citizen," was revived and reconsidered. This project, for which Sir Leonard and Nic Leate "laboured much," was "for a river to be brought on the north of the city into it, for the cleansing the sewers and ditches, and for the better keeping London wholesome, sweet, and clean." An admirable *intention;* and it is not impossible nor improbable that in less than two centuries hence, we, of the present sanitary era, may be accounted, for our sanitary measures, as senseless as we now account good Sir Leonard Halliday and the worthy and grave Nic Leate. These gentlemen cared not to brook filth in their houses, nor to be annoyed by it in the nightly pollution of the streets, but they advocated its injection into running water, and into water often running slowly and difficultly, and continually under the eyes and noses of the citizens. *We*, I apprehend, go a little further. We drink, and use for the preparation of our meals, the befouled water, which they did not; for, more than seven-eighths of our water-supply from the companies is drawn from the Thames, the main sewer of the greatest city in the world, ancient or modern, into which millions of tons of every description of refuse are swept yearly.

Of the Kinds and Characteristics of Sewers.

The sewers of London may be arranged into two distinct groups—according to the side of the Thames on which they are situate.

Now the essential difference between these two classes of sewers lies in the elevation of the several localities whence the sewers carry the refuse to the Thames.

The chief differences in the circumstances of the people north and south of the river are shown

in the annexed table from the Registrar-General's returns :—

	London.	North side of the River.	South side of the River.
Elevation of the ground, in feet, above Trinity high-water mark .	39	51	5
Density, or number of persons to an acre, 1849 . . .	30	52	14
Deaths from Cholera to 10,000 persons living, in 60 weeks, ending Nov. 24, 1849 . .	66	44	127
Deaths from all causes annually to 10,000 persons (5000 males, 5000 females) living, during the 7 years, 1838-44 . . .	252	251	257

Here, it will be seen, that while the houses on the north side of the river stand, on an average, 51 feet above the high-water mark of the Thames, those on the south side are only 5 feet above it. The effect of this is shown most particularly in the deaths from cholera in 1849, which were nearly three times as many on the south as on the north side of the Thames. It is said, officially, that "of the 15 square miles of the Urban district on the south side of the river Thames, *three* miles are from six to seven feet below high-water mark, so that the locality may be said to be drained only for four hours out of the twelve, and during these four hours very imperfectly . . . . . When the tide rises above the orifices of the sewers, the whole drainage of the district is stopped until the tide recedes again, rendering the whole system of sewers in Kent and Surrey only an *articulation of cesspools*."

That this is but the fact, the following table of the elevation in feet above the Trinity high-water mark, as regards the several districts on the Surrey side of the Thames, may be cited as evidence.

	Elevation.		Elevation.
Lewisham .	28	St. Olave .	2
Wandsworth	22	Bermondsey	0
Greenwich .	8	Rotherhithe	0
Camberwell	4	St. George's (Southwark) .	0
Lambeth .	3	Newington (below high water)	2
St. Saviour (Southwark) .	2		

From these returns, made by Capt. Dawson, R.E., the difficulty, to use no stronger word, attending the sewerage of the Surrey district is shown at once. There is no flow to be had, or—the word more generally used, no *run* for the sewage. In parts of the north of England it used to be a general, and still is a partial, saying among country-people who are figuratively describing what they account impossible. "Ay, when? *When* water runs up bank." This is a homely expression of the difficulties attending the Surrey sewerage.

There is, as regards these Surrey, more than the Kent, sewers, another evil which promotes the "articulation of cesspools." Some of these sewers have "dead-ends," like places which in the streets (a parallel case enough) are known as "no thoroughfare," and in these sewers it is seldom, in any state of the tide, that flushing can be resorted to; consequently these cesspool-like sewers remain uncleansed, or have to be cleansed by manual labour, the matter being drawn up into the street or road.

The refuse conduits of the metropolis are of two kinds :—

1. Sewers.
2. Drains.

These two classes of refuse-charts are often confounded, even in some official papers, the sewer being there designated the "main drain." All sewerage is undoubtedly drainage, but there is a manifest distinction between a sewer and a drain.

The First-Class Sewers, which are generally termed "main sewers," and run along the centres of the first-class streets (first-class alike from the extent or populousness of such streets), may be looked upon as underground rivers of refuse, to which the drains are tributary rivulets. No sewer exists unconnected with the drains from the streets and houses; but many house-drains are constructed apart from the sewers, communicating only with the cesspools. Even where houses are built in close contiguity to a public sewer, and built after the new mode without cesspools, there is always a drain to the sewer; no house so situated can get rid of its refuse except by means of a drain; unless, indeed, the house be not drained at all, and its filth be flung down a gully-hole, or got rid of in some other way.

These drains, all with a like determination, differ only in their forms. They are barrel-shaped, made of rounded bricks, or earthenware pipeage, and of an interior between a round and an oval, with a diameter of from 2 to 6 inches, although only a few private houses, comparatively, are so drained. The barrel drain of larger dimensions, is used in the newer public buildings and larger public mansions, when it represents a sort of house or interior sewer as well as a house main drain, for smaller drains find their issue into the barrel-drain. There is the barrel-drain in the new Houses of Parliament, and in large places which cover the site of, and are required for the purposes of several houses or offices. The tubular drain is simply piping, of which I have spoken fully in my account of the present compulsory mode of house drainage. The third drain, one more used to carry refuse to the cesspool than the sewer, but still carrying such refuse to the sewers, is the old-fashioned brick drain, generally 9 inches square.

I shall first deal with the sewerage, and then with the house and street drainage.

The sewer is a twofold receptacle of refuse; into it are conveyed the wet refuse not only of many of the houses, but of all the streets.

The slop or surface water of the streets is conveyed to the sewer by means of smaller sewers or street-drains running from the "kennel" or channel to the larger sewers.

In the streets, at such uncertain distances as the traffic and circumstances of the locality may require, are gully-holes. These are openings into the sewer, and were formerly called, as they were, simply gratings, a sort of iron trap-doors of grated bars, clumsily made, and placed almost at random. On each side of the street was, even into the present century, a very formidable channel, or kennel, as it was formerly written, into which, in heavy rains, the badly-scavaged street dirt was swept, often demanding a good leap from one who wished to cross in a hurry. These "kennels" emptied themselves into the gratings, which were not unfrequently choked up, and the kennel was then an utter nuisance. At the present time the channel is simply a series of stone work at the edge of the footpaths, blocks of granite being sloped to meet more or less at right angles, and the flow from the inclination from the centre of the street to the channel is carried along without impedimen or nuisance into the gully-hole.

The gully-hole opens into a drain, running, with a rapid slope, into the sewer, and so the wet refuse of the streets find its vent.

In many courts, alleys, lanes, &c., inhabited by the poor, where there is imperfect or no drainage to the houses, all the slops from the houses are thrown down the gully-holes, and frequently enough blood and offal are poured from butchers' premises, which might choke the house drain. There have, indeed, been instances of worthless street dirt (slop) collected into a scavager's vehicle being shot down a gully-hole.

The sewers, as distinct from the drains, are to be divided principally into three classes, all devoted to the same purpose—the conveyance of the underground filth of the capital to the Thames—and all connected by a series of drains, afterwards to be described, with the dwelling-houses.

The *first-class sewers* are found in the main streets, and flow at their outlets into the river.

The *second-class sewers* run along the second-class streets, discharging their contents into a first-class sewer; and

The *third-class sewers* are for the reception of the sewage from the smaller streets, and always communicate, for the voidance of their contents, with a sewer of the second or first description.

As regards the destination of the sewers, there is no difference between the Middlesex and Surrey portions of the metropolis. The sewage is *all* floated into the river.

The first-class sewers of the modern build rarely exceed 50 inches by 30 in internal dimensions; the second class, 40 inches by 24; the third, 30 inches by 18.

Smaller class or branch sewers, from No. 4 to No. 8 inclusive, also form part of the great subterranean filth-channels of the metropolis. It is only, however, the three first-mentioned classes which can be described as in any way principal *sewers;* the others are in the capacity of branch sewers, the ramifications being in many places very extensive, while pipes are often used. The dimensions of these smaller sewers, when pipes are not used, are—No. 4, 20 inches by 12; No. 5, 17½ inches by 10½; No. 6, 15 inches by 9; No. 7, 12 inches by 7½; and No. 8, 9 inches by 6.

These branch sewers may, from their circumscribed dimensions, be looked upon as mere channels of connection with the larger descriptions; but they present, as I have intimated, an important part of the general system. This may be shown by the fact, that in the estimates for building sewers for the improvement of the drainage of the city of Westminster (a plan, however, not carried out), the estimated, or indeed surveyed, run of the first class was to be 8118 feet; of the second class, 4524 feet; of the third, but 2086 feet; while of the No. 5 and No. 6 description, it was, respectively, 18,709 and 53,284 feet. The branch sewers may, perhaps, be represented in many instances as public drains connecting the sewer of the street with the issue from the houses, but I give the appellation I find in the reports.

The dimensions I have cited are not to be taken as an average size of the existing sewers of the metropolis on either side of the Thames, for no average size and no uniformity of shape can be adduced, as there has been no uniformity observed. The sewers are of all sizes and shapes, and of all depths from the surface of the streets. I was informed by an engineering authority that he had often seen it asserted that the naval authorities of the kingdom could not build a war-steamer, and it might very well be said that the sanitary authorities of the metropolis could not build a sewer, as none of the present sewers could be cited as in all respects properly fulfilling all the functions required. But it must be remembered that the present engineers have to contend with great difficulties, the whole matter being so complicated by the blunderings and mismanagement of the past.

The dimensions I have cited (because they appear officially) exceed the medium size of the *newer* sewerage, the average height of the first class being in such sewers about 3 feet 9 inches.

Of the width of the sewers, as of the height, no precise average can be drawn. Perhaps that of the New Palace main, or first-class sewer, 3 feet 6 inches, may be nearest the average, while the smaller classes diminish in their width in the proportions I have shown. The sewers of the older constructions nearly all widen and deepen as they near the outlet, and this at no definite distance from the river, but from a quarter of a mile or somewhat less to a mile and more. Some such sewers are then 14 feet in width; some 20 feet, and no doubt of proportionate height, but I do not find that the height has been ascertained. For flushing purposes there are recesses of greater or less width, according to the capacity of the sewer, where sluice-gates, &c., can be fixed, and water accumulated.

Under the head of "Subterranean Survey of

Original from HARVARD UNIVERSITY

the Sewers," will be found some account of the different dimensions of the sewers.

The form of the interior of the sewers (as shown in the illustrations I have given) is irregularly elliptical. They are arched at the summits, and more or less hollowed or curved, internally, at the bottom. The bottom of the sewer is called the "invert," from a general resemblance in the construction to an "inverted" arch. The *best* form of invert is a matter which has attracted great engineering attention. It is, indeed, the important part of the sewer, as the part along which there is the flow of sewage; and the superior or inferior formation of the invert, of course, facilitates or retards the transmission of the contents.

A few years back, the building of egg-shaped, or "oviform" sewers, was strongly advocated. It was urged that the flow of the sewage and the sewer-water was accelerated by the invert (especially) being oviform, as the matter was more condensed when such was the shape adopted, while the more the matter was diffused, as in some of the inverts of the more usual form of sewers, the less rapid was its flow, and consequently the greater its deposit.

What extent of egg-shaped sewers are now, so to speak, at work, I could not ascertain. One informant thought it might be somewhere about 50 miles.

The following interesting account of the velocities of streams, with a relativeness to sewers, is extracted from the evidence of Mr. Phillips :—

"The area of surface that a sewer will drain, and the quantity of water that it will discharge in a given time, will be greater or less in proportion as the channel is inclined from a horizontal to a vertical position. The ordinary or common run of water in each sewer, due from house drainage alone, and irrespective of rain, should have sufficient velocity to prevent the usual matter discharged into the sewer from depositing. For this purpose, it is necessary that there should be in each sewer a contant velocity of current equal to 2½ feet per second, or 1¾ mile per hour." Mr. Phillips then states that the inclinations of all rivulets, &c., diminish as they progress to their outfalls. "If the force of the waters of the river Rhone," he has said, "were not absorbed by the operation of some constant retardation in its course, the stream would have shot into the Bay of Marseilles with the tremendous velocity of 164 miles every hour. Even if the Thames met with no system of impediments in its course, the stream would have rushed into the sea with a velocity of 80 feet per second, or 54½ miles in an hour. . . . . The inclinations of the sewers of a natural district should be made to diminish from their heads to their outfalls in a corresponding ratio of progression, so that as the body of water is increased at each confluence, one and the same velocity and force of current may be kept up throughout the whole of them."

Mr. Phillips advocates a tubular system of sewerage and drainage.

The main sewer, which has lately called forth the most public attention and professional controversy, is that connected with the new Houses of Parliament, or as they are called in divers reports and correspondence, the "New Palace at Westminster."

The workmanship in the building of the sewers is of every quality. The material of which some of the older sewers are constructed is a porous sort of brick, which is often found crumbling and broken, and saturated with damp and rottenness, from the exhalations and contact of their contents. The sewers erected, however, within the last twenty, and more especially within the last ten years, are sometimes of granite, but generally of the best brick, with an interior coating of enduring cement, and generally with concrete on their exterior, to protect them from the dampness and decaying qualities of the superincumbent or lateral soil.

The depth of the sewers—I mean from the top of the sewer to the surface of the street—seems to vary as everything else varies about them. Some are found forty feet below the street, some *two* feet, some almost level! These, however, are exceptions; and the average depth of the sewers on the Middlesex side is from twelve to fourteen feet; on the Surrey side, from six to eight feet. The reason is that the north shores of the metropolis are above the tide level, the south shores are below it.

An authority on the subject has said, "The Surrey sewers are bad, owing principally to the land being below tide level. They were the most expensively constructed, because, *perhaps*, in that Commission the surveyors were paid by percentage on the cost of works. When it was proposed, in the Westminster Commission, to effect a reduction of four-fifths in the cost, it was like a proposition to return the officers' salaries to that extent, if they had been paid in that way."

The reader may have observed that the official intelligence I have given all, or nearly all, refers to the "Westminster and part of Middlesex" Commission, and to that of the "Surrey and Kent." This is easily accounted for. In the metropolitan districts, up to 1847, the only Commission which published its papers was the Westminster, of which Mr. L. C. Hertslet had the charge as clerk; when the Commissions were consolidated in 1847, he printed the Westminster and Surrey only, the others being of minor importance.

I may observe that one of the engineers, in showing the difficulty or impossibility of giving any description of a *system* of sewerage, as to points of agreement or difference, represents the whole mass as but a "detached parcel of sewers."

The course of the sewers is in no direct or uniform line, with the exception of one characteristic—all their bearings are towards the river as regards the main sewers (first-class), and all the bearings of the second-class sewers are towards the main sewers in the main streets. The smaller classes of sewers fill up the great area of London sewerage with a perfect network of intersection and connection, and even this network is increased

manyfold by its connection with the house-drains.

There is no map of the general sewerage of the metropolis, merely "sections" and "plans" of improvements making or suggested, in the reports of the surveyors, &c., to the Commissioners; but did a map of subterranean London exist, with its lines of every class of sewerage and of the drainage which feeds the sewers; with its course, moreover, of gas-pipes and water-pipes, with their connection with the houses, the streets, the courts, &c., it would be the most curious and skeleton-like map in the world.

Of the Subterranean Character of the Sewers.

In my inquiries among that curious body of men, the "Sewer Hunters," I found them make light of any danger, their principal fear being from the attacks of rats in case they became isolated from the gang with whom they searched in common, while they represented the odour as a mere nothing in the way of unpleasantness. But these men pursued only known and (by them) beaten tracks at low water, avoiding any deviation, and so becoming but partially acquainted with the character and direction of the sewers. And had it been otherwise, they are not a class competent to describe what they saw, however keen-eyed after silver spoons.

The following account is derived chiefly from official sources. I may premise that where the deposit is found the greatest, the sewer is in the worst state. This deposit, I find it repeatedly stated, is of a most miscellaneous character. Some of the sewers, indeed, are represented as the dust-bins and dung-hills of the immediate neighbourhood. The deposit has been found to comprise all the ingredients from the breweries, the gas-works, and the several chemical and mineral manufactories; dead dogs, cats, kittens, and rats; offal from slaughter-houses, sometimes even including the entrails of the animals; street-pavement dirt of every variety; vegetable refuse; stable-dung; the refuse of pig-styes; night-soil; ashes; tin kettles and pans (pansherds); broken stoneware, as jars, pitchers, flower-pots, &c.; bricks; pieces of wood; rotten mortar and rubbish of different kinds; and even rags. Our criminal annals of the previous century show that often enough the bodies of murdered men were thrown into the Fleet and other ditches, then the open sewers of the metropolis, and if found washed into the Thames, they were so stained and disfigured by the foulness of the contents of these ditches, that recognition was often impossible, so that there could be but one verdict returned—"Found drowned." Clothes stripped from a murdered person have been, it was authenticated on several occasions in Old Bailey evidence, thrown into the open sewer ditches, when torn and defaced, so that they might not supply evidence of identity. So close is the connection between physical filthiness in public matters and moral wickedness.

The following particulars show the characteristics of the underground London of the sewers. The subterranean surveys were made after the commissions were consolidated.

"An old sewer, running between Great Smith-street and St. Ann-street (Westminster), is a curiosity among sewers, although it is probably only one instance out of many similar constructions that will be discovered in the course of the subterranean survey. The bottom is formed of planks laid upon transverse timbers, 6 inches by 6 inches, about 3 feet apart. The size of the sewer varies in width from 2 to 6 feet, and from 4 to 5 feet in height. The inclination of the bottom is very irregular: there are jumps up at two or three places, and it contains a deposit of filth averaging 9 inches in depth, the sickening smell from which escapes into the houses and yards that drain into it. In many places the side walls have given way for lengths of 10 and 15 feet. Across this sewer timbers have been laid, upon which the external wall of a workshop has been built; the timbers are in a decaying state, and should they give way, the wall will fall into the sewer."

From the further accounts of this survey, I find that a sewer from the Westminster Workhouse, which was of all shapes and sizes, was in so wretched a condition that the leveller could scarcely work for the thick scum that covered the glasses of the spirit-level in a few minutes after being wiped. "At the outfall into the Dean-street sewer, it is 3 feet 6 inches by 2 feet 8 inches for a short length. From the end of this, a wide sewer branches in each direction at right angles, 5 feet 8 inches by 5 feet 5 inches. Proceeding to the eastward about 30 feet, a chamber is reached about 30 feet in length, from the roof of which hangings of putrid matter *like stalactites* descend *three feet in length*. At the end of this chamber, the sewer passes under the public privies, the ceilings of which can be seen from it. Beyond this it is not possible to go."

"In the Lucas-street sewer, where a portion of new work begins and the old terminates, a space of about 10 feet has been covered with boards, which, having broken, a dangerous chasm has been caused immediately under the road."

"The West-street sewer had one foot of deposit. It was flushed while the levelling party was at work there, and the stream was so rapid that it nearly washed them away, instrument and all."

There are further accounts of "deposit," or of "stagnant filth," in other sewers, varying from 6 to 14 inches, but that is insignificant compared to what follows.

The foregoing, then, is the pith of the first authentic account which has appeared in print of the actually surveyed condition of the subterranean ways, over which the super-terranean tides of traffic are daily flowing.

The account I have just given relates to the (former) Westminster and part of Middlesex district on the north bank of the Thames, as ascertained under the Metropolitan Commission. I now give some extracts concerning a similar

survey on the south bank, in different and distant directions in the district, once the "Surrey and Kent." The Westminster, &c., survey took place in 1848; the Kent and Surrey in 1849. In the one case, 72 miles of sewers were surveyed; in the other, 69½ miles.

"The surveyors (in the Surrey and Kent sewers) find great difficulty in levelling the sewers of this district (I give the words of the Report); for, in the first place, the deposit is *usually* about two feet in depth, and in some cases it amounts to nearly *five feet* of putrid matter. The smell is usually of the most horrible description, the air being so foul that explosion and choke damp are very frequent. On the 12th January we were very nearly losing a whole party by choke damp, the last man being dragged out on his back (through two feet of black fœtid deposits) in a state of insensibility. . . . . Two men of one party had also a narrow escape from drowning in the Alscot-road sewer, Rotherhithe.

"The sewers on the Surrey side are very irregular; even where they are inverted they frequently have a number of steps and inclinations the reverse way, causing the deposit to accumulate in *elongated cesspools*.

"It must be considered very fortunate that the subterranean parties did not first commence on the Surrey side, for if such had been the case, we should most undoubtedly have broken down. When compared with Westminster, the sewers are smaller and more full of deposit; and, bad as the smell is in the sewers in Westminster, it is infinitely worse on the Surrey side."

Several details are then given, but they are only particulars of the general facts I have stated.

The following, however, are distinct facts concerning this branch of the subject.

In my inquiries among the working scavagers I often heard of their emptying street slop into sewers, and the following extract shows that I was not misinformed:—

"The detritus from the macadamized roads frequently forms a kind of grouting in the sewers so hard that it cannot be removed without hand labour.

"One of the sewers in Whitehall and another in Spring-gardens have from three to four feet of this sort of deposit; and another in Eaton-square was found filled up within a few inches of the 'soffit,' but it is supposed that the scavengers (scavagers) emptied the road-sweepings down the gully-grate in this instance;" and in other instances, too, there is no doubt—especially at Charing Cross, and the Regent Circus, Piccadilly.

Concerning the sewerage of the most aristocratic parts of the city of Westminster, and of the fashionable squares, &c., to the north of Oxford-street, I glean the following particulars (reported in 1849). They show, at any rate, that the patrician quarters have not been unduly favoured; that there has been no partiality in the construction of the sewerage. In the Belgrave and Eaton-square districts there are many faulty places in the sewers which abound with noxious matter, in many instances stopping up the house drains and "smelling horribly." It is much the same in the Grosvenor, Hanover, and Berkeley-square localities (the houses in the squares themselves included). Also in the neighbourhood of Covent-garden, Clare-market, Soho and Fitzroy-squares; while north of Oxford-street, in and about Cavendish, Bryanstone, Manchester, and Portman-squares, there is so much rottenness and decay that there is no security for the sewers standing from day to day, and to flush them for the removal of their "most loathsome deposit" might be "to bring some of them down altogether."

One of the accounts of a subterranean survey concludes with the following rather curious statement:—"Throughout the new Paddington district the neighbourhood of Hyde Park Gardens, and the costly squares and streets adjacent, the sewers abound with the foulest deposit, from which the most disgusting effluvium arises; indeed, amidst the whole of the Westminster District of Sewers the *only* little spot which can be mentioned as being in at all a satisfactory state is the Seven Dials."

I may point out also that these very curious and authenticated accounts by no means bear out the zymotic doctrine of the Board of Health as to the cause of cholera; for where the zymotic influences from the sewers were the worst, in the patrician squares of what has been called Belgravia and Tyburnia, the cholera was the least destructive. This, however, is no reason whatever why the stench should not be stifled.

Of the House-Drainage of the Metropolis as connected with the Sewers.

Every house built or rebuilt since the passing of the Metropolitan Sewers Act in 1848, must be drained, with an exception, which I shall specify, into a sewer. The law, indeed, divested of its technicalities is this: the owner of a newly-erected house must drain it to a sewer, without the intervention of a cesspool, if there be a sewer within 100 feet of the site of the house; and, if necessary, in places but partially built over, such owner must continue the sewer along the premises, and make the necessary drain into it; all being done under the approval of the proper officer under the Commissioners. If there be, however, an established sewer, along the side, front, or back of any house, a covered drain must be made into that at the cost of the owner of the premises to be drained. "Where a sewer," says the 46th section of the Act, "shall already be made, and a drain only shall be required, the party is to pay a contribution towards the original expense of the sewer, if it shall have been made within thirty-five years before the 4th of September, 1848, the contribution to be paid to the builder of the sewer." . . . . . . "In cases where there shall be no sewer into which a drain could be made, the party must make a covered drain to lead into a cesspool or other place (not under a house) as the Commissioners may direct. If the parties infringe this rule, the Commissioners may

Original from HARVARD UNIVERSITY

do the work and throw the cost on them in the nature of an improvement rate, or as charges for default, and levy the amount by distress."

I mention these circumstances more particularly to show the extent, and the far-continued ramification, of the subterranean metropolis. I am assured by one of the largest builders in the western district of the capital that the new regulations (as to the dispensing with cesspools) are readily complied with, as it is a recommendation which a house agent, or any one letting new premises, is never slow to advance ("and when it 's the truth," he said, "they do it with a better grace"), that there will be in the course of occupancy no annoyance and no expense incurred in the clearing away of cesspoolage.

I shall at present describe only the house-drainage, which is connected with the public sewerage. The old mode of draining a house separately into the cesspool of the premises will, of course, be described under the head of cesspoolage, and that old system is still very prevalent.

At the times of passing both general and local Acts concerning buildings, town improvements and extensions, the erection of new streets and the removal of old, much has been said and written concerning better systems of ventilating, warming, and draining dwelling-houses; but until after the first outbreak of cholera in England, in 1832, little public attention was given to the great drainage of all the sewers. However, on the passing of the Building and Sanitary Acts generally, the authorities made many experiments, not so much to improve the system of sewerage as of house-drainage, so as to make the dwelling-houses more wholesome and sweet.

To effect this, the great object was the abolition of the cesspool system, under which filth must accumulate, and where, from scamped buildings or other causes, evaporation took place, the effects of the system were found to be vile and offensive, and have been pronounced miasmatic. Having just alluded to these matters, I proceed to describe the modernly-adopted connection of house-drainage and street-sewerage.

Experiments, as I have said, were set on foot under the auspices of public bodies, and the opinions of eminent engineers, architects, and surveyors were also taken. Their opinions seem really to be concentrated in the advocacy of *one* remedy—improved house-drainage; and they appear to have agreed that the system which is at present adopted is, under the circumstances, the best that can be adopted.

I was told also by an eminent practical builder, perfectly unconnected with any official or public body, and, indeed, often at issue with surveyors, &c., that the new system was unquestionably a great improvement in every respect, and that some years before its adoption as at present he had abetted such a system, and had carried it into effect when he could properly do so.

I will first show the mode and then the cost of the new system.

I find it designated "back," "front," "tubular," and "pipe" house-drainage, and all with the object of carrying off all fæces, soil water, cesspool matter, &c., before it has had time to accumulate. It is not by brick or other drains of masonry that the system is carried out or is recommended to be carried out, but by means of tubular earthenware pipes; and for any efficient carrying out of the projected improvement a system of *constant*, and not as at present *intermittent*, supply of water from the several companies would be best. These pipes communicate with the nearest sewer. The pipes in the tubular drainage are of red earthenware or stoneware (pot).

The use of earthenware, clay, or pot pipes for the conveyance of liquids is very ancient. Mr. Stirrat, a bleacher in Paisley, in a statement to the Board of Health, mentioned that clay pipes were used in ancient times. King Hezekiah (2nd Book of Kings, chap. 20, and 2nd Book of Chronicles, chap. 32) brought in water from Jerusalem. "His pool and conduit," said Mr. Stirrat, "are still to be seen. The conduit is three feet square inside, built of freestone, strongly cemented; the stone, fifteen inches thick, evidently intended to sustain a considerable pressure; and I have seen pipes of clay, taken by a friend from a house in the ruins of the ancient city, of one inch bore, and about seven inches in diameter, proving evidently, to my mind, that ancient Jerusalem was supplied with water on the principle of gravitation. The pools or reservoirs are also at this day in tolerably good order, one of them still filled with water; the other broken down in the centre, no doubt by some besieging enemy, to cut off the supply to the city."

The new system to supply the place of the cesspools is a *combined*, while the old is principally a *separate*, system of house-drainage; but the new system is equally available for such separate drainage.

As regards the success of this system the reports say experiments have been tried in so large a number of houses, under such varied and, in many cases, disadvantageous circumstances, that no doubts whatsoever can remain in the minds of competent and disinterested persons as to the efficient self-cleansing action of well-adjusted tubular drains and sewers, even without any additional supplies of water.

Mr. Lovick said:—

"A great number of small 4-inch tubular drains have been laid down in the several districts, some for considerable periods. They have been found to keep themselves clear by the ordinary soil and drainage waters of the houses. I have no doubt that pipes of this kind will keep themselves clear by the ordinary discharge of house-drainage; assuming, of course, a supply of water, pipes of good form, and materials properly laid, and with fair usage."

"One of the earliest illustrations of the tubular system," it is stated in a Report of the Board of Health, "was given in the improved drainage of a block of houses in the cloisters of Westminster,

Original from HARVARD UNIVERSITY

which had been the seat of a severe epidemic fever. The cesspools and the old drains were filled up, and an entire system of tubular drainage and sewerage substituted for the service of that block of houses.

"The Dean of Westminster, in a letter on the state of this drainage, says, 'I beg to report to the Commissioners that the success of the entire new pipe-drainage laid down in St. Peter's College during the last twelve months has been complete. I consider this experiment on drainage and sewage of about fifteen houses to afford a triumphant proof of the efficacy of draining by pipes, and of the facility of *dispensing entirely with cesspools and brick sewers.*' Up to this time they have acted, and continue to act, perfectly.

"Mr. Morris, a surveyor attached to the Metropolitan Sewers Commission, gives the following account of the action of trial works of improved house-drainage :—

"'I have introduced the new 4-inch tubular house-drains into some houses for the trustees of the parish of Poplar, with water-closets, and have received no just cause of complaint. In every instance where I have applied it, I found the system answer extremely well, if a sufficient quantity of water has been used.

"'The answer of the householders as to the effect of the new drainage has invariably been that they and their families have been better in health; that they were formerly annoyed with smells and effluvia, from which they are now quite free.

"'Since the new drainage has been laid down there has been only occasion to go on the ground to examine it once for the whole year, and that was from the inefficiency of the water service. It was found that rags had been thrown down and had got into the pipe; and further, that very little water had been used, so that the stoppage was the fault of the tenant, not of the system.'"

Mr. Gotto, the engineer, having stated that in a plan for the improvement of Goulston-street, Whitechapel, not only was the removal of all cesspools contemplated, but also the substitution of water-closet apparatus, gave the following estimate of *the cost*, provided the pipes were made and the work done by contract under the Commissioners of Sewers :—

Water-closet Apparatus, &c.

	£	s.	d.
Emptying, &c., cesspool	0	12	0
Digging, &c., for 8-feet pipe drain, at 4d.	0	2	8
Making good to walls and floor of water-closet over drain, at 3d.	0	2	0
8 feet run of 4-inch pipe, at 3d.	0	2	0
Laying ditto, at 2d.	0	1	4
Extra for junction	0	0	4
Fixing ditto	0	0	2
Water-closet apparatus, with stool cock	0	10	0
Fixing ditto	0	2	0
Contingencies (10 per cent.)	0	3	6
	1	16	0

	£	s.	d.
Brought forward	1	16	0
The yard sink and drain would cost	0	11	2
Kitchen sink and drain	0	15	7½
So that the cost of *back* draining one house, including water-closet, would be	3	2	9½

The *front* tubular drainage of a similar house (with fifteen yards of carriage-way to be paved) would cost 6*l.* 2*s.* 7½*d.*; or the drainage would cost, according to the old system, 11*l.* 13*s.* 11*d.*

"The engineering witnesses who have given their special attention to the subject," state the Board of Health, in commenting on the information I have just cited, "affirm that upon the improved system of combined works the expense of the apparatus in substitution of cesspools would *not greatly exceed one-half the expense* of cleaning the cesspools."

The engineers have calculated — stating the difficulty of coming to a nice calculation — that the present system of cesspools entailed an average expenditure, for cleansing and repairs, of 4*d.* a week on each householder; and that by the new system it would be but 1¾*d.* The Board of Health's calculations, however, are, I regret to say, always dubious.

The subjoined scale of the difference in cost was prepared at the instance of the Board.

Mr. Grant took four blocks of houses for examination, and the results are given as a guide to what would be the general expenditure if the change took place :—

"In one block of 44 houses—

The length of drains by back drainage was 1544 feet.

Cost (exclusive of pans, traps, and water in both cases) of back drainage, 83*l.* 12*s.*, or 1*l.* 18*s.* per house.

Cost of separate tubular drainage, 467*l.* 9*s.* 6*d.*, or 10*l.* 12*s.* 6*d.* per house.

Cost of separate brick drains, 910*l.* 19*s.*, or 20*l.* 14*s.* 1*d.* per house.

"In another block of 23 houses—

The length of back drains was 783 feet.

Of separate drains, 1437 feet.

The cost of back tubular drains, 45*l.* 12*s.* 6*d.*, or 1*l.* 19*s.* 8*d.* per house.

Of separate tubular drains, 131*l.* 13*s.* 6*d.*, or 5*l.* 14*s.* 6*d.* per house.

Of separate brick drains, 305*l.* 7*s.*, or 13*l.* 5*s.* 6*d.* per house.

"In another block of 46 houses—

The length of back drainage, 1143 feet.

Ditto by separate ditto, 1892 feet.

The cost of back tubular drainage, 66*l.* 5*s.* 2*d.*, or 1*l.* 8*s.* 9¾*d.* per house.

Ditto of separate ditto ditto, 178*l.* 19*s.* 8*d.*, or 3*l.* 17*s.* 10*d.* per house.

Ditto of separate brick ditto, 390*l.* 4*s.*, or 8*l.* 9*s.* 8*d.* per house.

"In a fourth block of 46 houses—
The length of back drains, 985 feet.
Ditto of separate ditto, 2913 feet.
Cost of back tubular drainage, 66*l.* 8*s.* 2*d.*, or 1*l.* 8*s.* 10½*d.* per house.
Ditto of separate ditto ditto, 262*l.* 11*s.* 7*d.*, or 5*l.* 14*s.* 2*d.* per house.
Ditto of separate brick ditto, 614*l.* 16*s.* 3*d.*, or 13*l.* 7*s.* 3¾*d.* per house."

I have mentioned the diversity of opinion as to the best form, and even material, for a sewer; and there is the same diversity as to the material, &c., for house and gully or street-drainage, more especially in the *pipes* of the larger volume. The pipe-drainage of any description is far less in favour than it was. One reason is that it does not promote *subsoil drainage;* another is the difficulty of repairs if the joints or fittings of pipes require mending; and then the combination of the noxious gases is most offensive in its exhalations, and difficult to overcome.

I was informed by a nightman, used to the cleansing of drains and to night-work generally, that when there was any escape from one of the tubular pipes the stench was more intense than any he had ever before experienced from any drains on the old system.

Of the London Street-Drains.

We have as yet dealt only with the means of removing the liquid refuse from the houses of the metropolis. This, as was pointed out at the commencement of the present subject, consists principally of the 19,000,000,000 gallons of water that are annually supplied to the London residences by mechanical means. But there still remain the 5,000,000,000 gallons of surface or rain-water to be carried off from the 1760 miles of streets, and the roofs and yards of the 300,000 houses which now form the British metropolis. If this immense volume of liquid were not immediately removed from our thoroughfares as fast as it fell, many of our streets would not only be transformed into canals at certain periods of the year, but perhaps at all times (except during drought) they would be, if not impassable, at least unpleasant and unhealthy, from the puddles or small pools of stagnant water that would be continually rotting them. Were such the case, the roads and streets that we now pride ourselves so highly upon would have their foundations soddened. "If the surface of a road be not kept clean so as to admit of its becoming dry between showers of rain," said Lord Congleton, the great road authority, "it will be rapidly worn away." Indeed the immediate removal of rain-water, so as to prevent its percolating through the surface of the road, and thereby impairing the foundation, appears to be one of the main essentials of road-making.

The means of removing this surface water, especially from the streets of a city where the rain falls at least every other day throughout the year, and reaches an aggregate depth of 24 feet in the course of the twelvemonth, is a matter of considerable moment. In Paris, and indeed almost all of the French towns, a channel is formed in the middle of each thoroughfare, and down this the water from the streets and houses is continually coursing, to the imminent peril of all pedestrians, for the wheels of every vehicle distribute, as it goes, a muddy shower on either side of the way.

We, however, have not only removed the channels from the middle to the sides of our streets, but instituted a distinct system of drainage for the conveyance of the wet refuse of our houses to the sewers—so that there are no longer (excepting in a very small portion of the suburbs) open sewers, meandering through our highways; the consequence is, the surface-water being carried off from our thoroughfares almost as fast as it falls, our streets are generally dry and clean. That there are exceptions to this rule, which are a glaring disgrace to us, it must be candidly admitted; but we must at the same time allow, when we think of the vast extent of the roadways of the metropolis (1760 miles!— nearly one-half the radius of the earth itself), the deluge of water that anuually descends upon every inch of the ground which we call London (38,000,000,000 gallons!—a quantity which is almost sufficient for the formation of an American lake), and the vast amount of traffic, over the greater part of the capital—the 13,000 vehicles that daily cross London Bridge, the 11,000 conveyances that traverse Cheapside in the course of twelve hours, the 7700 that go through Temple Bar, and the 6900 that ascend and descend Holborn Hill between nine in the morning and nine at night, the 1500 omnibuses and the 3000 cabriolets that are continually hurrying from one part of the town to another, and the 10,000 private carriage, job, and cart horses that incessantly *perviate* the metropolis—when we reflect, I say, on this vast amount of traffic—this deluge of rain—and the wilderness of streets, it cannot but be allowed that the cleansing and draining of the London thoroughfares is most admirably conducted.

The mode of street drainage is by means of what is called a gully-hole and a gully-drain.

*The Gully-hole** is the opening from the surface of the street (and is seen generally on each side of the way), into which all the fluid refuse of the public thoroughfares runs on its course to the sewer.

The Gully-drain is a drain generally of earthenware piping, curving from the side of the street to an opening in the top or side of the sewer, and is the means of communication between the sewer and the gully-hole.

The gully-hole is indicated by an iron grate being fitted into the surface of the side of a footpath, where the road slopes gradually from its centre to the edge of the footpath, and down this grate the water runs into the channel contrived

* *Gully* here is a corruption of the word *Gullet*, or throat; the Norman is *gueile* (Lat. *gula*), and the French, *goulet;* from this the word *gully* appears to be directly derived. A *gully*-drain is literally a *gullet*-drain, that is, a drain serving the purposes of a gullet or channel for liquids, and a gully-hole the mouth, orifice, or opening to the *gullet* or gully-drain.

for it in the construction of the streets. These gully-grates, the observant pedestrian—if there be a man in this hive of London who, without professional attraction to the matter, regards for a few minutes the peculiarities of the street (apart from the houses) which he is traversing—an observant pedestrian, I say, would be struck at the constantly-recurring grates in a given space in some streets, and their paucity in others. In Drury-lane there is no gully-grate, as you walk down from Holborn to where Drury-lane becomes Wych-street; whilst in some streets, not a tenth of the length of Drury-lane, there may be three, four, five, or six grates. The reason is this:—There is no sewer running down Drury-lane; a contiguous sewer, however, runs down Great Wyld-street, draining, where there are drains, the hundred courts and nooks of the poor, between Drury-lane and Lincoln's-inn-fields, as well as the more open places leading down towards the proximity of Temple Bar. This Great Wyld-street sewer, moreover, in its course to Fleet Bridge, is made available for the drainage (very grievously deficient, according to some of the reports of the Board of Health) of Clare-market. Grates would of course be required in such a place as Drury-lane, only the street is thought to be sufficiently on the descent to convey the surface-water to the grate in Wych-street.

The parts in which the gully-grates will be found the most numerous are where the main streets are most intersected by other main streets, or by smaller off-streets, and indeed wherever the streets, of whatever size, continually intersect each other, as they do off nearly all the great street-thoroughfares in the City. Although the sewers may not be according to the plan of the streets, the gully-grates must nevertheless be found at the street intersections, whether the nearest point to the sewer or not, or else the water would not be quickly carried off, and would form a nuisance.

I am informed, on good authority, both as regards the City and Metropolitan Commissions, that the average distance of the gully-grates is thirty yards one from another, including both sides of the way. Their number does not depend upon population, but simply on the local characteristics of the highways; for of course the rain falls into all the streets in proportion to their size, whether populous or half-empty localities. As, however, the more distant roads have not such an approximation of grates, and the law which requires their formation is by no means—and perhaps, without unnecessary interference, cannot be—very definite, I am informed that it may fairly be represented, that, of the 1760 miles of London public ways, more than two-thirds, "or" remarked one informant, "say 1200 miles, are grated on *each* side of the street or road, at distances of sixty yards." This would give 59 gully-holes in every one of the 1200 miles of street said to be so supplied. Hence the total number throughout the metropolis will be 70,800.

The gully-drain, which is the street-drain, always presents now a sloping curve, describing, more or less, part of a circle. This drain starts, so to speak, from the side of the street, while its course to the sewer, in order to economize space, is made by any most appropriate curve, to include the reception of as great a quantity of wet street-refuse as possible; for if the gully-drains were formed in a direct, or even a not-very-indirect line, from the street sides to the sewers, they would not only be more costly, more numerous, but would, in fact, as I was told, "choke the under-ground" of London, for now the subterranean capital is so complicated with gas, water, and drain-pipes, that such a system as will allow room for each is indispensable. The new system is, moreover, more economical. In the City the gully-drains are nearly all of nine-inch diameter in tubular pipeage. In the metropolitan jurisdiction they are the same, but not to the same extent, some being only six inches.

Fifty, or even thirty years ago, the old street channels for gully drainage were costly constructions, for they were made so as to suit sewers which were cleansed by the street being taken "up," and the offensive deposit, thick and even indurated as it often was in those days, drawn to the surface. Some few were three and even four feet square; some two feet six inches wide, and three or four feet high; all of brick. I am assured that of the extent or cost of these old contrivances no accounts have been preserved, but that they were more than twice as costly as the present method.

In all the reports I have seen, metropolitan or city—the statements of the flushermen being to the same purport—there are complaints as to the uses to which the gully-holes are put in many parts, every kind of refuse admissible through the bars of the grate being stealthily emptied down them. The paviours, if they have an opportunity, sweep their surplus grout into the gullies, and so do the scavagers with their refuse occasionally, though this is generally done in the less-frequented parts, to get rid of the "slop," which is valueless.

In a report, published in 1851, Mr. Haywood points out the prevalence of the practice of using the gully-gratings as dustbins! A sewer under Billingsgate accumulated in a few months many cart-loads, composed almost wholly of fish-shells; and 114 cart-loads of fish-shells, cinders, and rubbish were removed from the sewers in the vicinity of Middlesex-street (Petticoat-lane); these had accumulated in about twelve months. "Reconstructing the gullies," he says, "so as to intercept improper substances (which has been recently done at Billingsgate), might prevent this material reaching the sewers, but it would still have to be removed from the gullies, and would thus still cause perpetual expense. Indeed, I feel convinced that nothing but making public example by convicting and punishing some offenders, under clause 69 of 'The City of London Sewers' Act,' will stop the practice, so universal in the poorer localities, of using the gullies as dustbins."

The Gully-holes are now trapped—with very few exceptions, one report states, while another report intimates that gully-trapping has no exception at all. The trap is resorted to so that the effluvium from

HARVARD UNIVERSITY

a gully-drain may not infect the air of the public ways; but among engineers and medical sanitary inquirers, there is much difference of opinion as to whether the system of trapping is desirable or not. The general opinion seems to be, however, that all gullies should be trapped.

Of the City gully-traps, Mr. Haywood, in a report for the year 1851, says, as regards the period of their introduction:—

"About seventeen years ago your then surveyor (Mr. Kelsey) applied the first traps to sewer gullies, and from that date to the present the trapping of gullies has been adopted as a principle, and the city of London is still, I believe, the only metropolitan area in which the gullies are all trapped. The traps first constructed have since been (as all first inventions or adaptations ever have or will be) improved upon, and are rapidly being displaced by those of more improved construction.

"Now, of the incompatible conditions required of gully-traps, of the difficulty of obtaining such mechanical appliances so effective and perfect as can *theoretically* be devised, but yet of the extreme desirability of obtaining them as perfect as modern science could produce, your honourable court has, at least, for as long as I have had the honour of holding office under you, been fully alive to; no prejudice has opposed impediment to the introduction of novelties; your court has been always open to inventors, and, at the present time, there are sixteen different traps or modes of trapping gullies under trial within your jurisdiction.

"Nor has the provision of the means of excluding effluvium from the atmosphere been your only care; but the cleanliness of the sewers, and the prevention of accumulation of decomposing refuse, both by regulated cleansings, and by constructing the sewage upon the most improved principles, have also been your aim and that of your officers; and I do not hesitate to assert, that the offensiveness of the escape from the gullies has been of late years much diminished by the care bestowed upon the condition of the sewers.

"374 gullies have been retrapped in the City upon improved principles during the last year."

The gully-traps are on the principle of self-acting valves, but it is stated in several reports, that these valves often remain permanently open, partly from the street refuse (especially if mixed with the débris from new or removed buildings) not being sufficiently liquified to pass through them, and partly from the hinges getting rusted, and so becoming fixed.

Of the Length of the London Sewers and Drains.

There is no official account precisely defining the length of the London sewerage; but the information acquired on the subject leaves no doubt as to the accuracy of the following facts.

About 900 miles of sewers of the metropolis may be said to have been surveyed; and it is known that from 100 to 150 miles more constitute a portion of the metropolitan sewerage; this, too, independently of that of the City, which is 50 miles. Altogether I am assured that the sewers of the urban part of London, included within the 58 square miles before mentioned, measure 1100 miles.

The classes of sewers comprised in this long extent are pretty equally apportioned, each a third, or 366 miles, of the first, second, and third classes respectively. Of this extent about 200 miles are still, in the year 1852, *open* sewers!—to say nothing of the great open sewer, the Thames. The open sewers are found principally in the Surrey districts, in Brixton, Lewisham, Tooting, and places at the like distance from the more central parts of the Commissioners' jurisdiction. These open sewers, however, are disappearing, and it is intended that in time no such places shall exist; as it is, some miles of them are inclosed yearly. The open sewers in what may be considered more of the heart of the metropolis are a portion of the Fleet-ditch in Clerkenwell, and places in Lambeth and Bermondsey, or about 20 miles in the interior to 180 miles in the exterior portion of the capital. These are national disgraces.

The 1100 miles above-mentioned, however, include only the sewers, comprising neither the house nor gully-drains. According to the present laws, all newly-built houses must be drained into the sewers; and in 1850 there were 5000 applications from the western districts alone to the Commissioners, for the promotion of the drainage of that number of old and new houses into the sewers, the old houses having been previously drained into cesspools.

I am assured, on good authority, that fully one-half of the houses in the metropolis are at the present time drained into the sewers. In one street, about a century old, containing in the portion surveyed for an official purpose, on the two sides of the way, 76 houses, the number was found to be equally divided—half the drainage being into sewers and half into cesspools. The number of houses in the metropolis proper, of 115 square miles area, is 307,722. The majority, as far as is officially known, are now drained into the public sewers, or into private or branch sewers communicating with the larger public receptacles, so that—allowing 200,000 houses to be included in the 58 square miles of the urban sewerage, and admitting that some wretched dwelling-places are not drained at all—it is reasonable to assume that at least 100,000 houses within this area are drained into the sewers.

The average length of the house-drains is, I learn from the best sources, 50 feet per house. The builder of a new house is now required by law to drain it, at the proprietor's cost, 100 feet, if necessary, to a sewer. In some instances, in detached houses, where the owners object to the cesspool system, a house drain has been carried 230 feet to a sewer, and sometimes even farther; but in narrow or moderately wide streets, from 18 to 26 feet across, and in alleys and narrow places (in case there is sewerage) the house drains may be but from 12 to 20 feet. Both these

Original from HARVARD UNIVERSITY

lengths of drainage are exceptions, and there is no question that the average length may be put at 50 feet. In some squares, for example, the sewer runs along the centre, so that the house-drains here are in excess of the 50 feet average.

The length of the house-drainage of the more central part of London, assuming 100,000 houses to be drained into the sewers, and each of such drains to be on the average 50 feet long, is, then, 5,000,000 feet, or about 2840 miles.

But there are still the street or gully-drains for the surface-water to be estimated. In the Holborn and Finsbury division alone, the length of the "main covered sewers" is said to be 83 miles; the length of "smaller sewers" to carry off the surface-water from the streets 16 miles; the length of drains leading from houses to the main sewers, 264.

Now, if there be 16 miles of gully-drains to 83 miles of main covered sewers, and the same proportion hold good throughout the 58 square miles over which the sewers extend, it follows that there would be about 200 miles of gully-drains to the gross 1100 miles of sewers.

But this is only an approximate result. The length and character of the gully-drains I find to vary very considerably. If the streets where the gully-grates are found have no sewer in a line with the thoroughfare, still the water must be drained off and conveyed to the nearest sewer, of any class, large or small, and consequently at much greater length than if there were a sewer running down the street. Neither is the number of the gully-holes any sure criterion of the measurement of the gully-drains, for where the intersections are, and consequently the gully-holes frequent, a number, sometimes amounting to ten, are made to empty their contents into the same gully-drain. Neither do the returns of yearly expenditure, presented to Parliament by the Metropolitan Court of Sewers, supply information. But even if the exact length, and the exact price paid for the formation of that length, were given, it would supply but *the year's* outlay as regards the additions or repairs that had been made to the gully-drains, and certainly not furnish us with the original cost of the whole.

One experienced informant told me—but let me premise that I heard from all the gentlemen whom I consulted, a statement that they could only compute by analogy with other facts bearing upon the subject—was confident, that taking only 1200 miles of public way as gully-drained, that extent might be considered as the length of the gully-drains themselves. Even calculating such drains to run from each side of the public way, which is generally the case, I am told that, considering the economy of underground space which is now necessary, the length of 1200 miles is as fair an estimate for gully-drainage (apart from other drainage) as for the length of the streets so gullied.

Hence we have, for the gross extent of the whole sewers and drains of the metropolis, the following result,—

	Miles.
Main covered sewers	1100
House-drains	2840
Gully-drains for surface-water of streets	1200
Total length of the sewers and drains of the metropolis . .	5140

The island of Great Britain, I may observe, is, at its extreme points, 550 miles from north to south, and 290 from east to west. It would, therefore, appear that the main sewers of the capital are just double the length of the whole island, from the English Channel to John-o'-Groats, and nearly three times longer than the greatest width of the country. But this is the extent of the sewerage alone. The drainage of London is about equal in length to the diameter of the earth itself!

Of the Cost of Constructing the Sewers and Drains of the Metropolis.

The money actually expended in constructing the 1100 miles of sewers and 4000 miles of drains, even if we were only to date from Jan. 1, 1800, is not and never can be known. They have been built at intervals, as the metropolis, so to speak, *grew*. They were built also in many sizes and forms, and at many variations of price, according to the depth from the surface, the good or bad management, or the greater or lesser extent of jobbery or "patronage" in the several independent commissions. Accounts were either not presented in "the good old times," or not preserved.

Had the 1100 miles of sewers to be constructed anew, they would be, according to the present prices paid by the Commissioners—not including digging or such extraneous labour, but the cost of the sewer only—as follows:—

366 miles of sewers of the first class, or 1,932,480 feet, at 15*s.* per foot	£1,449,360
366 miles, or 1,932,480 feet of the second class, at 11*s.* per foot .	1,062,864
Same length of third class, at 9*s.* per foot	869,616
Total cost of the sewers of the metropolis	£3,381,840

As this is a lower charge than was paid for the construction of more than three-fourths of the sewers, we may fairly assume that their cost amounted to from three millions and a half to four millions of pounds sterling.

The majority of the house-drains running into the sewers are brick, and seldom less than 9 inches square; sometimes, in the old brick drains, they are some inches larger, and in the very old drains, and in some 100 years old, wooden planks were often used instead of a brick or stone construction, for the sake of reducing cost, and replaced when rotted. The wood, in many cases, soon decayed, and since 1847 no wooden sewers have been allowed to be formed, nor any old ones to be repaired with new wood; the work must be of stone or brick, if not pipeage. About two-thirds

Original from HARVARD UNIVERSITY

of the drains running from the houses to the sewers are brick; the remaining third tubular, or earthenware pipes. The cost, if now to be formed, would be somewhat as follows:—

1893½ miles of brick drains, 5*s.* per foot, as average of sizes . .	£2,499,200
945¾ feet of tubular drains, average of sizes 2*s.* 6*d.* . . .	624,800
Total cost of the house-drains of London	£3,124,000

The cost of the street or gully drains have still to be estimated.

The present cost of the 9-inch gully-pipe drains is about 3*s.* 6*d.* a foot; of the 6-inch, 2*s.* 6*d.* Of the proportionate lengths of these two classes of street-drains I have not been able to gain any account, for, I believe, it has never been ascertained in any way approaching to a total return. Taking 1200 miles, however, as quite within the full length of the gully-drains, and calculating at the low average of 3*s.* the foot for the whole, the total cost of the street-drains of the metropolis would be 950,400*l.*, or, I am assured, one might say a million sterling, and this, even if all were done at the present low prices; the original cost would, of course, have been much greater.

Hence, according to the above calculations, we have the following

Gross Estimate of the Cost of the Sewers and Drains of the Metropolis.

	£
1100 miles of main covered sewers	3,500,000
2840 miles of house-drains . .	3,000,000
1200 miles of gully or street drains	1,000,000
5140 miles of sewers and drainage =	7,500,000

Of the Uses of Sewers as a Means of Subsoil Drainage.

There is one other purpose toward which a sewer is available—a purpose, too, which I do not remember to have seen specified in the Metropolitan Reports.

"The first, and perhaps most important purpose of sewers, as respects health," says the Report of Messrs. Walker, Cubitt, and Brunel (1848), "is, *as under-drains to the surrounding earth.* They answer this purpose so effectually and quietly, and have done it so long, that their importance in this respect is overlooked. In the Sanitary Commissioners' Reports we do not find it once noticed, and the recommendation of the substitution of stone or earthenware pipes for the larger brick sewers, seems to show, that any provision for the *under-drainage* was thought unnecessary, although such a provision is in our opinion most important.

"Under the artificial ground, the collection of ages, which in the City of London, as in most ancient towns, forms the upper surface, is a considerable thickness of clean gravel, and under the gravel is the London clay. The present houses are founded chiefly on the artificial or 'made ground,' while the sewers are made through the gravel; and it is known practically, that however charged with water the gravel of a district may be, the springs for a considerable distance round are drawn down by making a sewer, and the wells that had water within a few feet of the surface have again to be sunk below the bottom of the sewer to reach the water. Every interstice between the stones of the gravel acts as an under-drain to conduct the water to the sewer, through the sides of which it finds its way, even if mortar be used in the construction.

"Hence the salubrity of a gravel foundation, if the water be drawn out of it by sewers or other means, as is the case with the City and with Westminster. A proof of this principle was afforded by the result of a reference to physicians and engineers in 1838, to inquire into the state of drainage and smells in and near Buckingham Palace, as to which there had been complaints, though none so heavy as Mr. Phillips now makes, when he says, 'that the drainage of Buckingham Palace is extremely defective, and that its precincts are reeking with filth and pestilential odours from the absence of proper sewerage!'"

The Report then shows the pains that were taken to ensure dryness in the Palace. Pits were dug in the garden 14 feet below the surface, and 3½ feet below high-water mark in the river, and they were found dry to the bottom. The kitchens and yard of the palace are, however, only 18 inches above Trinity high-water mark in the Thames, and therefore 18 inches below a very high tide. The physician, Sir James Clarke, and the engineers, Messrs. Simpson and Walker, in a separate Report, spoke in terms of commendation of the drainage of the Palace in 1838, as promotive of dryness. Since that time a connecting chain has been made from the Palace drains into the canal in St. James's-park, to prevent the wet from rising as formerly during heavy rains. "The Palace," it is stated in the Report of the three engineers, "should not be classed with the low part of Pimlico, where the drainage is, we believe, very defective, and to which, for anything we know to the contrary, the character given by Mr. Phillips may be applicable."

Unfortunately, however, for this array of opinions of high authority, and despite the advantages of a gravel bed for the substratum of the palatial sewerage, the drainage and sewerage about Buckingham Palace is more frequently than that of any other public place under repair, and is always requiring attention. It was only a few days ago, before the court left Windsor Castle for London, that men were employed night and day, on the drains and cesspoolage channels, to make, as one of them described it to me—and such working-men's descriptions are often forcible—"the place *decent.* I was hardly ever," he added, "in such a set of stinks as I've been in the sewers and underground parts of the palace."

OF THE CITY SEWERAGE.

As yet I have spoken only of the sewers of London* "without the City;" but the sewers within the City, though connected, for the general public drainage and sewerage of the capital, with the works under the control of the Metropolitan Commissioners, are in a distinct and strictly defined jurisdiction, superintended by City Commissioners, and managed by City officers, and consequently demand a special notice.

The account of the City sewers, however, may be given with a comparative brevity, for the modes of their construction, as well as their general management, do not differ from what I have described as pertaining to the extra-civic metropolis. There are, nevertheless, a few distinctions which it is proper to point out.

The City sewers are the oldest in the capital, for the very plain reason that the City itself, in its site, if not now in its public and private buildings, is the oldest part of London, as regards the abode of a congregated body of people.

The ages (so to speak) of these sewers, vary, for the most part, according to the dates of the City's rebuilding after the Great Fire, and according to the dates of the many alterations, improvements, removal or rebuilding of new streets, markets, &c., which have been effected since that period. Before the Great Fire of 1666, all drainage seems, with a few exceptions, to have been fortuitous, unconnected, and superficial.

The *first* public sewer built after this important epoch in the history of London was in Ludgate-street and hill. This was the laudable work of the Dean and Chapter of St. Paul's, and was constructed at the instance, it is said, and after the plans, of Sir Christopher Wren. There is, perhaps, no official or documentary proof of this, for the proclamations from the King in council, the Acts of Parliament, and the resolutions of the Corporation of the City of London at that important period, are so vague and so contradictory, and were so frequently altered or abrogated, and so frequently disregarded, that it is more impossible than difficult to get at the truth. Of the fact which I have just mentioned, however, there need be no doubt; nor that the *second* public City sewer was in Fleet-street, commenced in 1668, the second year after the fire.

There are, nevertheless, older sewers than this, but the dates of their construction are not known; we have proof merely that they existed in old London, or as it was described by an anonymous writer (quoted, if I remember rightly, in Maitland's "History of London"), London "*ante ignem*"—London before the fire. These sewers, or rather portions of sewers, are severally near Newgate, St. Bartholomew's Hospital sewer, and that of the Irongate by the Tower.

The sewer, however, which may be pointed out as the most remarkable is that of Little Moorgate, London-wall. It is formed of red tiles; and from such being its materials, and from the circumstance of some Roman coins having been found near it, it is supposed by some to be of Roman construction, and of course coeval with that people's possession of the country. This sewer has a flat bottom, upright sides, and a circular arch at its top; it is about 5 feet by 3 feet. The other older sewers present much about the same form; and an Act in the reign of Charles II. directs that sewers shall be so built, but that the bottom shall have a circular curve.

I am informed by a City gentleman—one taking an interest in such matters—that this sewer has troubled the repose of a few civic antiquaries,

* Of the derivation of the word *Sewer* there have been many conjectures, but no approximation to the truth. One of the earliest instances I have met with of any detailed mention of sewers, is in an address delivered by a "Coroner," whose name does not appear, to "a jury of sewers." This address was delivered somewhere between the years 1660 and 1670. The coroner having first spoken of the importance of "Navigation and Drayning" (draining), then came to the question of sewers.

"Sewars," he said, "are to be accounted your grand Issuers of Water, from whence I conceive they carry their name (*Sewars quasi Issuers*). I shall take his opinion who delivers them to be Currents of Water, kept in on both sides with banks, and, in some sense, they may be called a certain kind of a little or small river. But as for the derivation of the word Sewar, from two of our English words, *Sea* and *Were*, or, as others will have it, *Sea* and *Ward*, give me leave, now I have mentioned it, to—leave it to your judgments.

"However, this word *Sewar* is very famous amongst us, both for giving the title of the Commission of Sewars itself, and for being the ordinary name of most of your common water-courses, for Drayning, and therefore, I presume, there are none of you of these juries but both know—

"1. What Sewars signify, and also, in particular,

"2. What they are; and of a thing so generally known, and of such general use."

The Rev. Dr. Lemon, who gave the world a work on "English Etymology," from the Greek and Latin, and from the Saxon and Norman, was regarded as a high authority during the latter part of the last century, when his quarto first appeared. The following is his account, under the head "Sewers"—

"Skinn. rejects Minsh's. deriv. of 'olim scriptum fuisse *seward* à sea-ward, quod versus mare factæ sunt: longè verisimilius à Fr. Gall. *eauier;* sentina; *incile,* supple. aquarum:'—then why did not the Dr. trace this Fr. Gall. *eauier?* if he had, he would have found it distorted ab 'Υδωρ, *aqua; sewers* being a species of *aqueduct:*—Lye, in his Add., gives another deriv., viz. 'ab Iceland. *sua, colare;* ut existimo; ad quod referre vellem *sewer; cloaca;* per *sordes* urbis ejiciuntur:'—the very word *sordes* gives me a hint that *sewer* may be derived à 'Σαιρω, *vel* Σαροω, *verro:* nempe quia *sordes,* quæ *everruntur* è domo, in unum locum *accumulantur;* R. Σωρος, *cumulus:* Voss.'—*a collection of sweepings, slop, dirt, &c.*"

But these are the follies of learning. Had our lexicographers known that the vulgar were, as Dr. Latham says, "the conservators of the Saxon language" with us, they would have sought information from the word "shore," which the uneducated, and, consequently, unperverted, invariably use in the place of the more polite "sewer"—the common *sewer* is always termed by them "the common *shore.*" Now the word *shore,* in Saxon, is written *score* and *scor* (for $c = h$), and means not only a bank, the land immediately next to the sea, but a *score,* a tally—for they are both substantives, made from the verb *sceran* (p. *scear, scær,* pp. *scoren, gescoren*), to *shear,* cut off, *share,* divide; and hence they meant, in the one case, the division of the land from the sea; and in the other, a division cut in a piece of wood, with a view to counting. The substantive *scar* has the same origin; as well as the verb to *score,* to cut, to gash. The Scandinavian cognates for the Saxon *scor* may be cited as proofs of what is here asserted. They are, Icel., *skor,* a notch; Swed., *skdra,* a notch; and Dan., *skaar* and *skure,* a notch, an incision. It would seem, therefore, that the word *shore,* in the sense of *sewer* (Dan., *skure;* Anglice, *shure,* for $k = h$), originally meant merely a *score* or incision made in the ground, a *ditch* sunk with the view of carrying off the refuse-water, a watercourse, and consequently a drain. A sewer is now a covered ditch, or channel for refuse water.

some thinking that it was a Roman sewer, while others scouted such a notion, arguing that the Romans were not in the habit of doing their work by halves; and that if they had sewered London, great and enduring remains would have been discovered, for their main sewer would have been a solid construction, and directed to the Thames, as was and is the Cloaca Maxima, in the Eternal City, to the Tiber. Others have said that the sewer in question was merely built of Roman materials, perhaps first discovered about the time, having originally formed a reservoir, tank, or even a bath, and were keenly appropriated by some economical or scheming builder or City official.

"That the Britons," says Tacitus in his "Life of Agricola," "who led a roaming life, and were easily incited to war, might contract a love for peace, by being accustomed to a pleasanter mode of life, Agricola assisted them to build houses, temples, and market-places. By praising the diligent and upbraiding the idle, he excited such emulation among the Britons, that, after they had erected all those necessary buildings in their towns, they built others for pleasure and ornament, as porticoes, galleries, *baths*, and banqueting-houses."

The sewers of the city of London are, then, a comparatively modern work. Indeed, three-fourths of them may be called modern. The earlier sewers were—as I have described under the general head—ditches, which in time were arched over, but only gradually and partially, as suited the convenience or the profit of the owners of property alongside those open channels, some of which thus presented the appearance of a series of small uncouth-looking bridges. When these bridges had to be connected so as to form the summit of a continuous sewer, they presented every variety of arch, both at their outer and under sides; those too near the surface had to be lowered. Some of these sewers, however, were in the first instances connected, despite difference of size and irregularity of form. The result may be judged from the account I have given of the strange construction of some of the Westminster sewers, under the head of "subterranean survey."

How modern the City sewers are may best be estimated from the following table of what may be called the dates of their construction. The periods are given decennially as to the progress of the formation of *new* sewers:—

	Feet.		Feet.
1707 to 1717	2,805	1777 to 1787	8,693
1717 „ 1727	2,110	1787 „ 1797	3,118
1727 „ 1737	2,763	1797 „ 1807	5,116

1827 to 1837	39,072 feet.
1837 to 1847	88,363 „
	127,435

Thus the length made in the 20 years previous to 1847 was more than double all that was made during the preceding 120 years; while in the ten years from 1837 to 1847, the addition to the lineal extent of sewerage was very nearly equal to all that had been made in 130 years previously.

This addition of 127,435 feet, or rather more than 24 miles, seems but a small matter when "London" is thought of; but the reader must be reminded that only a small portion (comparatively) of the metropolis is here spoken of, and the entire length of the City sewerage, at the close of 1847, was but 44 miles; so that the additions I have specified as having been made since 1837, were more than one-half of the whole. The *re*-constructions are not included in the metage I have given, for, as the new sewers generally occupied the same site as the old, they did not add to the length of the whole.

The total length of the City sewerage was, on the 31st December, 1851, no less than 49 miles; while the entire public way was at the same recent period, 51 miles (containing about 1000 separate and distinct streets, lanes, courts, alleys, &c., &c.); and I am assured that in another year or so, not a furlong of the whole City will be unsewered.

"The more ancient sewers usually have upright walls, a flat or slightly-curved invert, and a semicircular or gothic arch. The form of such as have been built apparently more than 20 years ago, is that of two semicircles, of which the upper has a greater radius, connected by sloping side walls; those of recent construction are egg-shaped. The main lines are not unfrequently elliptic; in the case of the Fleet, and other ancient affluents of the Thames, the forms and dimensions vary considerably. Instances occur of sewers built entirely of stone; but the material is almost invariably brick, most commonly 9 inches in substance; the larger sewers 14, and sometimes 18 inches.

The falls or inclinations in the course of the City sewerage vary greatly, as much as from 1 in 240 to 1 in 24, or, in the first case, from a fall of 22 feet, in the latter, of course, to ten times such fall, or 220 feet per mile. There are, moreover, a few cases in which the inclination is as small as 1 in 960; others where it is as high as 1 in 14. This irregularity is to be accounted for, partly by the want of system in the old times, and partly from the natural levels of the ground. The want of system and the indifference shown to providing a proper fall, even where it was not difficult, was more excusable a few years back than it would be at the present time, for when some of these sewers were built, the drainage of the house-refuse into them was not contemplated.

The number of houses drained into the City sewers is, as precisely as such a matter can be ascertained, 11,209; the number drained into the cesspools is 5030. This shows a preponderance of drainage into the sewers of 6179. The length of the house-drains in the City, at an average of 50 feet to each house, may be estimated at upwards of 106 miles. These City drains are included in the general computation of the metropolis.

The gully-drains in the City are more frequent than in other parts of the metropolis, owing to the

Digitized by Google
Original from HARVARD UNIVERSITY

continual intersection of streets, &c., and perhaps from a closer care of the sewerage and all matters connected with it. The general average of the gully-drains I have shown to be 59 for every mile of street. I am assured that in the City the street-drains may be safely estimated at 65 to the mile. Estimating the streets gullied within the City, then, at an average of 50 miles, or about a mile more than the sewers, the number of gully-drains is 3250, and the length of them about 50 miles; but these, like the house-drains, have been already included in the metropolitan enumeration.

The actual sum expended yearly upon the construction, and repairs, and improvements of the City sewers cannot be cited as a distinct item, because the Court makes the return of the aggregate annual expenditure, as regards pavement, cleansing, and the matters specified as the general expenditure under the Court of Commissioners of the City Sewers. The cost, however, of the construction of sewers comprised within the civic boundaries is included in the general metropolitan estimate before given.

Of the Outlets, Ramifications, etc., of the Sewers.

In this enumeration I speak only of the *public* outlets into the river, controlled and regulated by public officers.

The orifices or mouths of the sewers where they discharge themselves into the Thames, beginning from their eastern, and following them seriatim to their western extremity, are as follows:—

Limehouse Hole.	Bridge-street, Westminster.
Irongate Wharf.	Pimlico.
Ratcliffe Cross.	Cubitt's (also in Pimlico).
Fox-lane, Shadwell.	Chelsea Bridge.
London Dock.	Fulham Bridge.
St. Katharine's Dock.	Hammersmith Bridge.
The eleven City outlets, which I shall specify hereafter.	Sandford Bridge (into a sort of creek of the Thames), or near the four bridges.
Essex-street, Strand.	Twickenham.
Norfolk-street, Strand.	Hampton.
Durham Hill (or Adelphi).	In all, 32.
Northumberland-street.	
Scotland-yard.	

It might only weary the reader to enumerate the outlets on the Surrey side of the Thames, which are 28 in number, so that the public sewer outlets of the whole metropolis are 60 in all.

The public sewer outlets from the City of London into the Thames are, as I have said, eleven in number, or rather they are usually represented as eleven, though in reality there are twelve such orifices—the "Upper" and "Eastern" Custom-House Sewers (which are distinct) being computed as one. These outlets, generally speaking the most ancient in the whole metropolis, are—

London Bridge.	Tower Dock.
Ancient Walbrook.	Pool Quay.
Paul's Wharf.	Custom House.
The Fleet-street Sewer at Blackfriars Bridge.	New Walbrook.
(I mention these four first, because they are the largest outlets).	Dowgate Dock.
	Hamburg Wharf.
	Puddle Dock.

Until recently, there was also Whitefriars Docks, but this is now attached to the Fleet Sewer outlet.

The Fleet Sewer is the oldest in London. No portion of the ditch or river composing it is now uncovered within the jurisdiction of the City; but until a little more than eleven years ago a portion of it, north of Holborn, was uncovered, and had been uncovered for years. Indeed, as I have before intimated, barges and small craft were employed on the Fleet River, and the City determined to "encourage its navigation." Even the "polite" Earl of Chesterfield, a century ago (for his lordship was born in 1694, and died in 1773), when asked by a Frenchman in Paris, if there was in London a river to compare to the Seine? replied that there certainly was, and it was called Fleet Ditch! This is now the sewer; but it was not a covered sewer until 1765, when the Corporation ordered it to be built over.

The next oldest sewer outlet is that at London Bridge, and London antiquaries are not agreed as to whether it or the Fleet is the oldest.

The Fleet Sewer at Blackfriars Bridge is 18 feet high; between Tudor-street and Fleet Bridge (about the foot of Ludgate-hill), 14 feet 3 inches high; at Holborn Bridge, 13 feet; and in its continuation in the long-unfinished Victoria-street, 12 feet 3 inches. In all these localities it is 12 feet wide.

The New London Bridge Sewer, built or rebuilt, wholly or partly, in 1830, is 10 feet by 8 at its outlet; decreasing to the south end of King William-street, where it is 9 feet by 7; while it is 8 feet by 7 in Moorgate-street.

Paul's Wharf sewer is 7 feet 6 inches by 5 feet 6 inches near the outlet.

With the one exception of the Fleet River, none of the City sewer outlets are covered, the Fleet outlet being covered even at low water. The issue from the others runs in open channels upon the shore.

Mr. Haywood (February 12, 1850), in a report of the City Sewer Transactions and Works, observes,—"During the year (1849) the outlet sewers at Billingsgate and Whitefriars, two of the outlets of main sewers which discharged at the line of the River Wall, have been diverted (times of storm excepted); there remain, therefore, but eleven main outlets within the jurisdiction of this commission, which discharge their waters at the line of the River Wall.

"As a temporary measure, it is expedient to convey the sewage of the whole of the outlets within the City by covered culverts, below low-water mark; this subject has been under the consideration both of this Commission and the Navigation Committee."

Whether the covered culvert is better than the open run, is a matter disputed among engineers (as are very many other matters connected with sewerage), and one into which I need not enter.

Mr. Haywood says further :—"The Fleet sewer already discharges its average flow, by a culvert, below low-water mark ; with one exception only, I believe, none of the numerous outlets, which, for a length of many miles, discharge at intervals into the Thames at the line of the River Wall, both within and without your jurisdiction, discharge by culverts in a similar manner."

These eleven outlets are far from being the whole number which give their contents into "the silver bosom of the Thames," along the bank-line of the City jurisdiction. There are (including the 11) 182 outlets; but these are not under the control (unless in cases of alteration, nuisance, &c.) of the Court of Sewers. They are the outlets from the drainage of the wharfs, public buildings, or manufactories (such as gas-works, &c.) on the banks of the river; and the right to form such outlets having been obtained from the Navigation Committee, who, under the Lord Mayor, are conservators of the Thames, the care of them is regarded as a private matter, and therefore does not require further notice in this work. The officers of the City Court of Sewers observe these outlets in their rounds of inspection, but interfere only on application from any party concerned, unless a nuisance be in existence.

To convey a more definite notion of the extent and ramified sweep of the sewers, I will now describe (for the first time in print) some of the chief *Sewer Ramifications*, and then show the proportionate or average number of public ways, of inhabited houses, and of the population to each great main sewer, distinguishing, in this instance, those as *great main sewers* which have an outlet into the Thames.

The reader should peruse the following accounts with the assistance of a map of the environs, for, thus aided, he will be better able to form a definite notion of the curiously-mixed and blended extent of the sewerage already spoken of.

First, then, as to the ramifications of the great and ancient Fleet outlet. From its mouth, so to speak, near Blackfriars Bridge, its course is not parallel with any public way, but, running somewhat obliquely, it crosses below Tudor-street into Bridge-street, Blackfriars, then occupies the centre of Farringdon-street, and that street's prolongation or intended prolongation into the New Victoria-street (the houses in this locality having been pulled down long ago, and the spot being now popularly known as "the ruins"), and continues until the City portion of the Fleet Sewer meets the Metropolitan jurisdiction between Saffron and Mutton hills, the junction, so to call it, being "under the houses"* (a common phrase among flushermen). A little farther on it connects itself with an open part of the Fleet Ditch, running at the back of Turnmill-street, Clerkenwell. In its City course, the sewer receives the issue from 150 public ways (including streets, alleys, courts, lanes, &c.), which are emptied into it from the second, third, or smaller class sewers, from Ludgate-hill and its proximate streets, the St. Paul's locality, Fleet-street and its adjacent communications in public ways, with a series of sewers running down from parts of Smithfield, &c. The *greatest* accession of sewage, however, which the Fleet receives from *one* issue, is a few yards beyond where the City has merged into the Metropolitan jurisdiction; this accession is from a first-class sewer, known as "the Whitecross-street sewer," because running from that street, and carrying into the Fleet the contributions of 60 crowded streets.

After the junction of the covered City sewer with the uncovered ditch in Clerkenwell, the Fleet-river sewer (again covered) skirts round Cold Bath Fields Prison (the Middlesex House of Correction), runs through Clerkenwell-green into the Bagnigge Wells-road, so on to Battle-bridge and King's-cross; then along the Old Saint Pancras-road, and thence to the King's-road (a name now almost extinct), where the St. Pancras Workhouse stands close by the turnpike-gate. Along Upper College-street (Camden-town) is then the direction of this great sewer, and running *under* the canal at the higher part of Camden-town, near the bridge by the terminus of the Great North Western Railway, it branches into the highways and thoroughfares of Kentish-town, of Highgate, and of Hampstead, respectively, and then, at what one informant described as "the outside" of those places, receives the open ditches, which form the further sewerage, under the control of the Commissioners, who cause them to be cleansed regularly.

In order to show more consecutively the direction, from place to place, in straight, devious, or angular course, of this the most remarkable sewer of the world, considering the extent of the drainage into it, I have refrained from giving beyond the Whitecross-street connection with the Fleet, an account of the number of streets sewered into this old civic stream. I now proceed to supply the deficiency.

From a large outlet at Clerkenwell-green (a very thickly-built neighbourhood) flows the connected sewage of 100 streets. At Maiden-lane, beyond King's-cross, a district which is now being built upon for the purposes of the Great Northern Railway, the sewage of 10 streets is poured into it. In the course of this sewer along Camden-town, it receives the issue of some 20 branches, or 40 streets, &c. About 15 other issues are received before the open ditches of Kentish-town, Highgate, and Hampstead are encountered.

It is not, however, merely the sewage collected in the precincts of the City proper, which is "outletted" (as I heard a flusherman call it) into the Thames. Other districts are drained into the large City outlets nearing the river. "Many of

* This outlet is known to the flushermen, &c., as "below the backs of houses," from its devious course *under the houses* without pursuing any direct line parallel with the open part of the streets.

HARVARD UNIVERSITY

your works," says Mr. Haywood, the City surveyer, in a report addressed to the City Commissioners, Oct. 23, 1849," have been beneficially felt by districts some miles distant from the City. Twenty-nine outlets have been provided by you for the sewage of the County of Middlesex; the high land of and about Hampstead, drains through the Fleet sewer; Holloway and a portion of Islington can now be drained by the London Bridge sewer; Norton Folgate and the densely-populated districts adjacent are also relieved by it."

On the other hand, the Irongate sewer (one of the most important), which has its outlet in the Tower Hamlets, drains a portion of the City.

The reader must bear in mind, also, that were he to traverse the Fleet sewer in the direction described—for all the men I conversed with on the subject, if asked to show the course of sewerage with which they were familiar, began *from* the outlet into the Thames—the reader, I say, must remember that he would be advancing all the way *against* the stream, in a direction in which he would find the sewage flowing onward to its mouth, while his course would be towards its sources.

On the left-hand side (for the account before given refers only to the right-hand side) proceeding in the same direction, after passing the underground precincts of the City proper, there is another addition near Saffron-hill, of the sewage of 30 streets; then at Gray's-inn-road is added the sewage of 100 streets; New-road (at King's-cross), 20 more streets; from the whole of Somers-town, a populous locality, the sewerage concentrating all the busy and crowded places round about "the Brill," &c., the sewage of 120 streets is received; and at Pratt-street, Camden-town, 12 other streets.

Thus into this sewage-current, directed to one final outlet, are drained the refuse of 517 streets, including, of course, a variety of minor thoroughfares, courts, alleys, &c., &c., as in the neighbourhoods of Gray's-inn-road, in Clerkenwell, Somers-town, &c. Some of these tributaries to the efflux of the sewage are "barrel-drains," but perform the function of sewers along small courts, where there is "no thoroughfare" either *upon* or *below* the surface.

The London Bridge sewer runs up Kihg William-street to Moorgate-street, along Finsbury-square into the City-road, diverging near the Wharf-road, which it crosses *under* the canal near the Wenlock basin, and thence along the Lower-road, Islington, by Cock-lane, through Highbury-vale; after this, at the extremity of Holloway, the open ditches, as in the former instance, carry on the conveyance of sewage from the outer suburbs.

The King's Scholars' Pond Sewer—which seems to have given the Commissioners more trouble than any other, in its connection with Buckingham Palace, St. James's Park, and the new Houses of Parliament—runs from Chelsea-bridge past Cubitt's workshops, and along the King's-road to Eaton-square, the whole of which is drained into it; then "turning round," as one man described it, it approaches Buckingham Palace, which, with its grounds, as well as a portion of St. James's and the Green parks, is drained into this sewer; then branching away for the reception of the sewage from the houses and gardens of Chelsea, it drains Sloane-street, and, crossing the Knightsbridge-road, runs through or across Hyde-park to the Swan at Bayswater, whence its course is by the Westbourne District and under the canal, along Paddington, until it attains the open country, or rather the grounds, in that quarter, which have been very extensively and are now still being built over, and where new sewers are constructed simultaneously with new streets.

Thus in the "reach," as I heard it happily enough designated, of each of these great sewers, the reader will see from a map the extent of the subterranean metropolis traversed, alike along crowded streets ringing with the sounds of traffic, among palatial and aristocratic domains, and along the parks which adorn London, as well as winding their ramifying course among the courts, alleys, and teeming streets, the resorts of misery, poverty, and vice.

Estimating, then, the number of sewers from the number of their river outlets, and regarding all the rest as the branches, or tributaries, to each of these superior streams, we have, adopting the area before specified as being drained by the metropolitan sewers, viz., 58 square miles, the following results:—

Each of the 60 sewers having an outlet into the Thames drains 618 statute acres.

And assuming the number of houses included within these 58 square miles to be 200,000, and the population to amount to 1,500,000, or two-thirds of the houses and people included in the Registrar-General's Metropolis, we may say that each of the 60 sewers would carry into the Thames the refuse from 25,000 individuals and 3333 inhabited houses. This, however, is partly prevented by the cesspoolage system, which supplies receptacles for a proportion of the refuse that, were London to be rebuilt according to the provisions of the present Building and Sanitary Acts, would *all* be carried, without any interception, into the river Thames by the media of the sewers.

In my account of cesspoolage I shall endeavour to show the extent of fæcal refuse, &c., contained in places not communicating with the sewers, and to be removed by the labour of men and horses, as well as the amount of fæcal refuse carried into the sewerage.

Of the Qualities, etc., of the Sewage.

The question of the value, the uses, and the best means of collecting for use, the great mass of the sewage of the metropolis, seems to have become complicated by the statements which have been of late years put forth by rival projectors and rival companies. In our smaller country towns, the neighbourhood of many being remarkable for fertility and for a green beauty of meadow-land and pasturage, the refuse of the towns, whether sewage or cesspoolage (if not washed into a

Digitized by Google Original from HARVARD UNIVERSITY

current, stream, or river), is purchased by the farmers, and carted by them to spread upon the land.

By *sewage*, I mean the contents of the *sewerage*, or of the series of sewers; which neither at present nor, I believe, at any former period, has been applied to any useful or profitable purpose by the metropolitan authorities. The readiest mode to get rid of it, without any care about ultimate consequences, has always been resorted to, and that mode has been to convey it into the Thames, and leave the rest to the current of the stream. But the Thames has its ebbs as well as its flow, and the consequence is the sewage is *never* got rid of.

The most eminent of our engineers have agreed that it is a very important consideration how this sewage should be not only innocuously but profitably disposed of; and if not profitably, in an immediate money return, to those who may be considered its owners (the municipal authorities of the kingdom), at least profitably in a national point of view, by its use in the restoration or enrichment of the fertility of the soil, and the consequent increase of the food of man and beast.

Sir George Staunton has pronounced some of the tea-growing parts of China to be as blooming as an English nobleman's flower-garden. Every jot of manure, human ordure, and all else, is minutely collected, even by the poorest.

I have already given a popular account of the composition of the metropolitan sewage, &c. (under the head of Wet Refuse), and I now give its scientific analysis.

In some districts the sewage is more or less liquid —in what proportion has not been ascertained— and I give, in the first place, an analysis of the sewage of the King's Scholars' Pond Sewer, Westminster, the result having been laid before a Committee of the House of Commons. As the contents of the great majority of sewers *must* be the same, because resulting from the same natural or universally domestic causes (as in the refuse of cookery, washing, surface-water, &c.), the analysis of the sewage of the King's Scholars' Pond Sewer may be accepted as one of sewer-matter generally.

Evidence was given before the committee as to the proportion of "land-drainage *water*" to what was really *manure*, in the matter derived from the sewer in question. A produce of 140 grains of manure was derived from a gallon of sewer-water. Messrs. Brande and Cooper, the analyzers, also state that one gallon (10 lbs. ?) of the liquid portion of the sewage, evaporated to dryness, gave 85·3 grains of solid matter, 74·8 grains of which was again soluble, and contained—

Ammonia	3·29
Sulphuric acid	0·62
Phosphate of lime	0·29
Lime	6·25
Chlorine	10·00

"and potass and soda, with a large quantity of soluble and vegetable matter, and 10·54 insoluble."

This insoluble portion consisted of

Phosphate of lime	2·32
Carbonate of lime	1·94
Silica	6·28
	10·54

The deposit from another gallon weighed 55 grains, of which 21·22 were combustible, being composed of animal matter "rich in nitrogen," some vegetable matter, and a quantity of fat. Of this matter 33·75 grains consisted of

Phosphate of lime	6·81
Oxide of iron	2·01
Carbonate of lime	1·75
Sulphate of lime	1·53
Earthy matter and sand	21·65
	33·75

Other Reports and other evidence show that what is described as "earthy matter and sand" is the mac, mud, and the mortar or concrete used in pavement, washed from the surface of the streets into the sewers by heavy rains; otherwise for the most part the proper load of the scavager's cart.

Further analyses might be adduced, but with merely such variation in the result as is inevitable from the state of the weather when the sewage is drawn forth for examination; whether the day on which this is done happens to be dry or wet *.

It has been ascertained, but the exact proportion is not, and perhaps cannot be, given, that the extent of covered to uncovered surface in the district drained by the King's Scholars' Pond Sewer was as 3 to 1, while that of the Ranelagh Sewer, not far distant, was as 1 to 3, at the time of the inquiry (1848).

"It could not be expected, therefore," says the Report, "that the Ranelagh Sewer (which, moreover, is open to the admission of the tide at its mouth), in the quantity or quality of the manure produced, could bear any proportion to the King's Scholars' Pond Sewer."

Mr. Smith, of Deanston, stated in evidence, that the average quantity of rain falling into King's Scholars' Pond Sewer was 139,934,586 cubic feet in a year, and he assumes 6,000,000 tons as the amount of average minimum quantity of drainage (yearly), yielding 4 cwt. of solid matter in each 100 tons = 1 in 500.

* The following is the analysis of a gallon of sewage, also dried to evaporation, by Professor Miller:—

Ammonia	3·26
Phosphoric acid	0·44
Potash	1·02
Silica	0·54
Lime	7·54
Magnesia	1·87
Common salt	13·66
Sulphuric acid	7·04
Carbonic acid	4·41
Combustible matter, containing 0·34 nitrogen	5·80
Traces of oxide of iron.	
Making in solution	45·58
Matters in suspension, consisting of combustible matters, sand, lime, and oxide of iron	44·50

Dr. Granville said, on the same inquiry, that he should be sorry to receive on his land 500 tons of diluted sewer water (such as that from the uncovered Ranelagh Sewer) for 1 ton of really fertilizing sewage, such as that to be derived from the King's Scholars' Pond Sewer.

I could easily multiply these analyses, and give further parliamentary or official statements, but, as the results are the same, I will merely give some extracts from the evidence of Dr. Arthur Hassall, as to the microscopic constituents of sewage-water :—

"I have examined," he said, "the sewer-water of several of the principal sewers of London. I found in it, amongst many other things, much decomposing vegetable matter, portions of the husks and the hairs of the down of wheat, the cells of the potato, cabbage, and other vegetables, while I detected but few forms of animal life, those encountered for the most part being a kind of worm or anælid, and a certain species of animalcule of the genus monas."

"How do you account," the Doctor was asked, "for the comparative absence of animal life in the water of most sewers?" "It is, doubtless, to be attributed," he replied, "in a great measure, to the large quantity of sulphuretted hydrogen contained in sewer-water, and which is continually being evolved by the decomposing substances included in it."

"Have you any evidence to show that sewer-water does contain sulphuretted hydrogen in such large quantity as to be prejudicial and even fatal to animal life?" "With a view of determining this question, I made the following experiments :— A given quantity of Thames water, known to contain living infusoria, was added to an equal quantity of sewer-water; examined a few minutes afterwards, the animalculæ were found to be either dead or deprived of locomotive power and in a dying state. A small fish, placed in a wine glass of sewer-water, immediately gave signs of distress, and, after struggling violently, floated on its side, and would have perished in a few seconds, had it not been removed and placed in fresh water. A bird placed in a glass bell-jar, into which the gas evolved by the sewer-water was allowed to pass, after struggling a good deal, and showing other symptoms of the action of the gas, suddenly fell on its side, and, although immediately removed into fresh air, was found to be dead. These experiments were made, in the first instance, with the sewer water of the Friar-street sewer (near the Blackfriars-road); they were afterwards repeated with the water of six other sewers on the Middlesex side, and with the same result, as respects the animalculæ and fish, but not the bird; this, although evidently much affected by the noxious emanations of the sewer-water, yet survived the experiment."

"Would you infer from these experiments that sewer-water, as contained in the Thames near to London, is prejudicial to health?" "I would, most decidedly; and regard the Thames in the neighbourhood of the metropolis as nothing less than diluted sewer-water."

"You have just stated that you found sewer-water to contain much vegetable matter, and but few forms of animal life; the vegetable matter you recognised, I presume, by the character of the cells composing the several vegetable tissues?" "Yes, as also by the action of iodine on the starch of the vegetable matter."

"In what way do you suppose these various vegetable cells, the husks of wheat, &c., reach the sewers?" "They doubtless proceed from the fœcal matter contained in sewage, and not in general from the ordinary refuse of the kitchen, which usually finds its way into the dust-bin."

"Sewer-water, then, although containing but few forms of animal life, yet contains, in large quantities, the food upon which most animalculæ feed?" "Yes; and it is this circumstance which explains the vast abundance of infusorial life in the water of the Thames within a few miles of London."

The same gentleman (a fellow of the Linnæan Society, and the author of "A History of the British Fresh-water Algæ," or water-weeds considered popularly), in answer to the following inquiries in connection with this subject, also said :—

"What species of infusoria represent the *highest* degree of impurity in water?" "The several species of the genera *Oxytricha* and *Paramecium*."

"What species is most abundant in the Thames from Kew Bridge to Woolwich?" "The *Paramecium Chrysalis* of Ehrenberg; this occurs in all seasons of the year, and in all conditions of the river, in vast and incalculable numbers; so much so, that a quart bottle of Thames water, obtained in any condition of the tide, is sure to be found, on examination with the microscope, to contain these creatures in great quantity."

"Do you find that the infusorium of which you have spoken varies in number in the different parts of the river between Kew Bridge and Woolwich?" "I find that it is most abundant in the neighbourhood of the bridges." [Where the outlet of the sewers is common.]

"Then the order of impurity of Thames water, in your view, would be the order in which it approaches the centre of London?" "Yes."

"You find then, in Thames water, about the bridges, things decidedly connected with the *sewer water*, as vegetable and animal matter in a state of decomposition?" "I do; about the bridges, and in the neighbourhood of London, there is very little living vegetable matter on which animalculæ could live; the only source of supply which they have is *the organic matter contained in sewer-water*, and which is to be regarded as the food of these creatures. Where infusoria abound, under circumstances *not* connected with sewage, vegetable matter in a living condition is certain to be met with."

Respecting the *uses of the sewage*, I may add the following brief observations. Without wishing in any way to prejudice the question (indeed the reader will bear in mind that I have all along spoken reprovingly of the waste of sewage), I am

bound to say that the opinions I heard during my inquiry from gentlemen scientifically and, in some instances, practically familiar with the subject, concurred in the conclusion that the *sewage* of the metropolis cannot, with all the applications of scientific skill and apparatus, be made either sufficiently portable or efficacious for the purposes of manure to assure a proper pecuniary return. In this matter, perhaps, speculators have not traced a sufficient distinction between the liquid manure of the sewers and the "*poudrette*," or dry manure, manufactured from the more solid excrementitious matter of the cesspools, not only in Paris, but, until lately, even in London, where the business was chiefly in the hands of Frenchmen. The staple of the French "*poudrette*" is *not* "*sewage*," that is, the outpourings of the sewers—for this is carried into the Seine, and washed away with little inconvenience, as the tide hardly affects that river in Paris; but it is altogether "*cesspoolage*," that is, the deposit of the cesspools, collected in fixed and moveable utensils, regulated by the "universal" police of Paris, and conveyed by Government labourers to the Voirées, which are huge reservoirs of night-soil at Montfauçon, about five miles, and in the Forest of Bondy, about ten miles, from the centre of Paris. The London-made manure also was all of cesspoolage; the contents of the nightman's cart being "shot" in the manufacturer's yard; and when so manufactured was, I believe, without exception, sent to the sugar-growing colonies, the farmers in the provinces pronouncing it "too hot" for the ground. The same complaint, I may observe, has been made of the French manufactured cesspool manure. I heard, on the other hand, opinions from scientific and practical gentlemen, that the sewer-water of London was so diluted, it was not profitably serviceable for the irrigation of land. All, however, agreed that the sewage of the metropolis ought not to be wasted, as it was certain that perseverance in experiment (and perhaps a large outlay) were certain to make sewage of value.

The following results, which the Board of Health have just issued in a Report, containing "Minutes of Information attested on the Application of Sewer-water and Town Manures to Agricultural Production," supply the latest information on this subject. The Report says first, that "to be told that the average yield of a county is 30 bushels of wheat per acre, or that the average weight of the turnip crop is 15 tons per acre, means very little, and there is little to be learned from such intelligence; but if it is shown that a certain farm under the usual mode of culture yielded certain weights per acre, and that the same land, by improved applications of the same manure, by the use of machinery, and by *employing double the number of hands, at increased wages*, is made to yield *fourfold* the weight of crop and of *better quality* than was previously obtained, a lesson is set before us worth learning."

It then proceeds to cite the following statements, on the authority of the Hon. Dudley Fortescue, as to the efficiency of sewage-water as a liquid manure applied to land.

"The first farm we visited was that of Craigentinney, situated about one mile and a half south-east of Edinburgh, of which 260 Scotch acres" (a Scotch acre is one-fourth more than any English acre) "receive a considerable proportion of such sewerage as, under an imperfect system of house-drainage, is at present derived from half the city. The meadows of which it chiefly consists have been put under irrigation at various times, the most recent addition being nearly 50 acres laid out in the course of last year and the year previous, which, lying above the level of the rest, are irrigated by means of a steam-engine. The meadows first laid out are watered by contour channels following the inequalities of the ground, after the fashion commonly adopted in Devonshire; but in the more recent parts the ground is disposed in 'panes' of half an acre, served by their respective feeders, a plan which, though somewhat more expensive at the outset, is found preferable in practice. The whole 260 acres take about 44 days to irrigate; the men charged with the duty of shifting the water from one pane to another give to each plot about two hours' irrigation at a time; and the engine serves its 50 acres in ten days, working day and night, and employing one man at the engine and another to shift the water. The produce of the meadows is sold by auction on the ground, 'rouped,' as it is termed, to the cow-feeders of Edinburgh, the purchaser cutting and carrying off all he can during the course of the letting, which extends from about the middle of April to October, when the meadows are shut up, but the irrigation is continued through the winter. The lettings average somewhat over 20*l.* the acre; the highest last year having brought 31*l.*, and the lowest 9*l.*; these last were of very limited extent, on land recently denuded in laying out the ground, and consequently much below its natural level of productiveness. There are four cuttings in the year, and the collective weight of grass cut in parts was stated at the extraordinary amount of 80 tons the imperial acre. The only cost of maintaining these meadows, except those to which the water is pumped by the engine, consists in the employment of two hands to turn on and off the water, and in the expense of clearing out the channels, which was contracted for last year at 29*l.*, and the value of the refuse obtained was considered fully equal to that sum, being applied in manuring parts of the land for a crop of turnips, which with only this dressing in addition to irrigation with the sewage-water presented the most luxuriant appearance. The crop, from present indications, was estimated at from 30 to 40 tons the acre, and was expected to realize 15*s.* the ton sold on the land. From calculations made on the spot we estimated the produce of the meadows during the eight months of cutting at the keep of ten cows per acre, exclusive of the distillery refuse they consume in addition, at a cost of 1*s.* to 1*s.* 6*d.* per head per week. The sea-meadows present a particularly striking example of the

Original from HARVARD UNIVERSITY

effects of the irrigation; these, comprising between 20 and 30 acres skirting the shores between Leith and Musselburgh, were laid down in 1826 at a cost of about 700*l.*; the land consisted formerly of a bare sandy tract, yielding almost absolutely nothing; it is now covered with luxuriant vegetation extending close down to high-water mark, and lets at an average of 20*l.* per acre at least. From the above statement it will be seen how enormously profitable has been the application in this case of town refuse in the liquid form; and I have no hesitation in stating that, great as its advantages have been, they might be extended four or five fold by greater dilution of the fluid. Four or five times the extent of land might, I believe, be brought into equally productive cultivation under an improved system of drainage in the city, and a more abundant use of water. Besides these Craigentinney meadows, there are others on this and on the west side of Edinburgh, which we did not visit, similarly laid out, and I believe realizing still larger profits, from their closer proximity to the town, and their lying within the toll-gates."*

Such, then, are said to be the results of a practical application of sewer-water. The preliminary remark of the Board of Health, however, applies somewhat to the statement above given; for we are not told what the *same land* produced before the liquid manure was applied; nor are we informed as to the peculiar condition and quantity of the land near Craigentinney, and how it differs from the land near London.

The other returns are of liquid manures, of which sewer-water formed no part, and, therefore, require no special notice of them. The following observations are, however, worthy of attention:—

"The cases above detailed furnish some measure of the possible results attainable in cultivation, especially corroborated as they are by others which did not on this occasion come under our personal observation, but one of which I may mention, having recently examined into it, that of Mr. Dickinson, at Willesden, who estimates his yield of Italian rye-grass at from 80 to 100 tons an acre, and gets 8 or 10 cuttings, according to the season; and as there is no peculiar advantage of soil or climate (the former ranging from almost pure sands to cold and tenacious clays, and the latter being inferior to that of a large proportion of England) to prevent the same system being almost universally adopted, they give some idea of the degree to which the productiveness of land may be raised by a judicious appliance of the means within our reach. When it is considered that such results may, in the vicinity of towns and villages, be most effectually brought about by the instant removal of all those matters which, when allowed to remain in them, are among the most fruitful sources of social degradation, disease, and death, one cannot but earnestly desire the furtherance of such measures as will ensure this double result of purifying the town and enriching the country; and as the facts I have stated came at the same time under the notice of the gentleman I mentioned above, under whose able superintendence the arrangements for the water-supply and drainage of several towns are now in course of execution, I trust it will not be long before this most advantageous mode of disposing of the refuse of towns may be brought into practical operation in various parts of the country.

"I have, &c.,

"D. F. Fortescue.

"General Board of Health."

Of the New Plan of Sewerage.

This branch of the subject hardly forms part of my present inquiry, but, having pointed out the defects of the sewers, it seems but reasonable and right to say a few words on the measures determined upon for their improvement. It is only necessary for me, however, to indicate the principal characteristics of the new, or rather intended, mode of sewerage, as the work may be said to have been but commenced, or hardly commenced in earnest, the Report of Mr. Frank Forster (the engineer) bearing the date of Jan. 30, 1851.

In the carrying out of the engineer's plan—which from its magnitude, and, in all human probability, from its cost, when completed, would be *national* in other countries, but is here only *metropolitan*—in the carrying out of this scheme, I say, two remarkable changes will be found. The one is the employment of the power of steam in sewerage; the other is the diversion of the sewage from the current of the Thames. The ultimate uses of this sewage, agriculturally or otherwise, form no part of the present consideration.

I should, however, first enumerate the general principles on which the best authorities have agreed that the London sewers should be constructed so as to ensure a proper disposal of the sewage, for these principles are said to be at the basis of Mr. Forster's plan.

I condense under the following heads the substance of a mass of Reports, Committee Meetings, Suggestions, Plans, &c.:—

1. The channels, or pipeage, or other means of conveying away house-refuse, should be so made that the removal will be *immediate*, more especially of any refuse or filth capable of suspension in water, since its immediate carrying off, it is said, would leave no time for the generation of miasma.

2. Means should be provided for such disposal of sewage as would prevent its tainting any stream, well, or pool, or, by its stagnation or obstruction, in any way poisoning the atmosphere. And, as a natural and legitimate result, it should be *so collected that it could be applied to the cultivation of the land* at the most economical rate.

* The following note appears in Mr. Fortescue's statement:—"In some trial works near the metropolis sewer water was applied to land, on the condition that the value of half the extra crop should be taken as payment. The dressings were only single dressings. The officer making the valuation reported, that there was at the least one sack of wheat and one load of straw per acre extra from its application on one breadth of land; in another, full one quarter of wheat more, and one load of straw extra per acre. The reports of the effects of sewer-water in increasing the yield of oats as well as of wheat were equally good. It is stated by Captain Vetch that in South America irrigation is used with great advantage for wheat."

3. In the providing works of deposit or storage in low districts, or "of discharge where the natural outlets are free," such works should be provided as would not subject any place, or any man's property, to the risk of inundation, or any other evil consequence; while in the construction of the drainage of the substratum, the works should be at such a depth below the foundation of all buildings that tenements should not be exposed to that continued damage from exhalation and dampness which leads to the dry rot in timber, and to an immature decay of materials and a general unhealthiness.

There are other points insisted upon in many Reports to which I need but allude, such as

(a.) The channels containing sewage should be of enduring and impermeable material, so as to prevent all soakage.

(b.) There should be throughout the channels of the subterranean metropolis a fall or inclination which would suffice to prevent the accumulation of any sewage deposit, with its deleterious influence and ultimate costliness.

(c.) Similar provisions should be used were it but to prevent the creation of the noxious gases which now permeate many houses (especially in the quarters inhabited by the poor) and escape into many streets, courts, and alleys, for until improvements are effected the pent-up sewage and the saturated brickwork of the sewers and older drains must generate such gases.

(d.) No tidal stream should ever receive a flow of sewage, because then the cause of evil is never absent, for the filth comes back with the tide; and as the Thames water constitutes the grand fount of metropolitan consumption, the water companies, with very trifling exceptions, give us back much of our own excrement, mixed with every conceivable, and sometimes noxious, nastiness, with which we may brew, cook, and wash—and drink, if we can. Filtering remedies but a portion of the evil.

Now it would appear that not one of these requirements, the necessity of which is unquestioned and unquestionable, is fully carried out by the present system of sewerage, and hence the need of some new plan in which the defects may be remedied, and the proper principles carried out.

The instructions given by the Court were to the following effect:—

A. The Thames should be kept free from sewage whatever the state of the tide.

B. There should be intercepting drains to carry off the sewage (so keeping the Thames unsoiled by it) wherever practicable.

C. The sewage should be raised by artificial means into a main channel for removal.

D. The intercepting sewers should be so constructed as to secure the largest amount of effective drainage without artificial appliances.

In preparing his plan, Mr. Forster had the advice and assistance of Mr. Haywood, of the City Court of Sewers.

The metropolis is divided into two portions—"the northern portion of the metropolis," or rather that portion of the metropolis which is on the north or Middlesex bank of the Thames; and the southern portion, or that which is on the south or Surrey side of the river.

The northern portion is in the new plan considered to "divide itself into two separate areas," and to these two areas different modes of sewerage are to be applied:

"1. The interception of the drainage of that district, which, from its elevation above the level of the outlet, is capable of having its sewage and rainfall carried off by gravitation.

"2. The interception of the drainage of that district, which, from its low lying position, will require its sewage, and in most localities its rainfall, to be lifted by steam-power to a proper level for discharge."

The first district runs from Holsden-green (beyond the better-known Kensall-green) in the west, to the Tower Hamlets in the east. Its form is irregular, but not very much so, merely narrowing from Westbourn-green to its western extremity, the country then becoming rural or woodland. Its highest reaches to the north are to Highgate and Stamford-hill. The nearest approach to the south is to a portion of the Strand, between Charing-cross and Drury-lane. Care has evidently been taken to skirt this district, so to speak, by the canals and the railroads. This division of the northern portion is described as "the district for natural drainage."

The area of this division is about 25¼ square miles.

The second division meets the first at the highway separating Kensington-gardens from Bayswater; and runs on, bordering the river, all the way to the West India Dock. Its shape is irregular, but, abating the roundness, presents somewhat of that sort of figure seen in the instrument known as a dumb-bell, the narrowest or hand-part being that between Charing-cross and Drury-lane, skirting the river as its southern bound. At its eastern end this second district widens abruptly, taking in Victoria-park, Stratford, and Bromley.

The area of this division of the northern portion is 16¼ square miles.

There are, moreover, two small tracts, comprising the southern part of the Isle of Dogs, and a narrow slip on the west side of the river Lea, which are intended to allow the rainfall to run into the Thames and the Lea respectively.

The area of the two is 1¾ square mile.

The area to be drained by natural outfall comprises, then, 25¼ square miles as regards rainfall, and the same extent as regards sewage; while the area to the drainage of which steam power is to be applied comprises 14¼ square miles of rainfall, and 16¼ square miles of sewage; the two united areas of rainfall and sewage respectively being 39¼ and 41¼ square miles.

The length of the great "high-level sewerage" will be, as regards the main sewer, 19 miles and 106 yards; that of the "low-level sewerage," 14 miles and 1501 yards.

I will now describe the course of each of these constructions.

Original from HARVARD UNIVERSITY

On the eastern bank of the Lea the sewage of both districts is to be concentrated. The high-level sewer will commence and *cross* the Lea near the "Four Mills." It is then to proceed "in a westerly direction under the East and West India Dock Railway and the Blackwall Extension Railway, beneath the Regent's-canal, to the east end of the Bethnal-green-road, at the crossing of the Cambridge-heath-road, at which point it will be joined by the proposed northern division of the Hackney-brook, which drains an extensive district up to the watershed line north of London, including Hackney, Stoke Newington and Holloway, and part of Highgate and Hampstead; from thence the main sewer proceeds along the Bethnal-green-road, Church-street, Old-street, Wilderness-row (where a short branch from Coppice-row will join) to Brook-street-hill; from thence to Little Saffron-hill, where a distance of about 100 yards is proposed to be carried by an aqueduct over the Fleet-valley; thence along Liquorpond-street, at the end of which it will receive a branch from, Piccadilly, on the south side, and a diversion of the Fleet-river, on the north side; thence along Theobald's-road, Bloomsbury- square, Hart-street, New Oxford-street, to Rathbone-place (where it will receive a diversion of the Regent-street sewer from Park-crescent), along Oxford-street, and extending thence across Regent-circus to South Molton-lane (where it will intercept the King's Scholars' Pond sewer), continuing still along Oxford-street to Bayswater-place, Grand Junction-road, Uxbridge-road, where it is joined by the Ranelagh sewer, the sewage of which it is capable of receiving, and at this point it terminates."

It is difficult to convey to a reader, especially to a reader who may not be familiar with the localities of London generally, any adequate notion of the largeness, speaking merely of extent, of this undertaking. Even a map conveys no sufficient idea of it.

Perhaps I may best be able to suggest to a reader's mind a knowledge of this largeness, when I state that in the district I have just described, which is but *one* portion (although the greatest) of the sewerage of but *one* side of the Thames, more than half a million of persons, and nearly 100,000 houses are, so to speak, to be sewered.

The low-level tract sewerage, also, concentrates on the Lea, "near to Four Mill's distillery, taking the north-western bank of the Limehouse Cut, at which point it receives the branch intended to intercept the sewage of the Isle of Dogs; thence continuing along the bank of Limehouse Cut, through a portion of the Commercial-road, Brook-street, and beneath the Sun Tavern Fields, into High-street, or Upper Shadwell; thence along Ratcliffe-highway and Upper East Smithfield, across Tower-hill, through Little and Great Tower-streets, Eastcheap, Cannon-street, Little and Great St. Thomas Apostle, Trinity-lane, Old Fish-street, and Little Knight Rider-street; thence beneath houses in Wardrobe-terrace, and on the eastern side of St. Andrew's-hill, along Earl-street to Blackfriars-road. From Blackfriars Bridge it is proposed to construct the sewer along the river shore to the junction of the Victoria-street sewer at Percy-wharf; which sewer between Percy-wharf and Shaftesbury-terrace, Pimlico, becomes thus an integral portion of the intercepting line; at Bridge-street, Westminster, a branch from the Victoria-street sewer is intended to proceed along Abingdon and Millbank-streets, as far as and for the purpose of taking up the King's Scholars' Pond and other sewers at their outlets into the Thames. From Shaftesbury-terrace the Victoria-street sewer is proposed to be extended through Eaton-square and along the King's-road, Chelsea, to Park-walk, intercepting all the sewers along its line, and terminating at a point where the drainage of Kensington may be brought into it without pumping."

The lines of sewerage thus described are, then, all to the *west* of the Lea, and all, whether from the shore of the Thames, or the northern reaches in Highgate and Hampstead, converging to a pumping station or sewage-concentration, on the *east* bank of the Lea, in West Ham. By this new plan, then, the high-level sewer is to *cross* the Lea, but that arrangement is impossible as respects the second district described, which is *below* the level of the Lea, so that its course is to be *beneath* that river, a little below where it is crossed by the high-level line. To dispose of the sewage, therefore, conveyed from the low-level tract, there will be a sewer of a "depth of *forty-seven* feet *below*" the invert of the high-level sewer. This sewer, then, at the depth of 47 feet, will run to the point of concentration containing the low-level sewage.

At this point of the works, in order that the sewage may be collected, so as to be disposed of ultimately in one mass, it has to be *lifted* from the low to the high-level sewer. The invert of the high-level sewer will at the lifting or pumping station be 20 feet *above* the ordnance datum, while that of the low-level sewer will be 27 feet *below* the same standard. Thus a great body of metropolitan sewage, comprising among other districts the refuse of the whole City of London, must be lifted no less than 47 feet, in order to be got rid of along with what has been carried to the same focus by its natural flow.

The lifting is to be effected by means of steam, and the pumping power required has been computed at 1100-horse power. To supply this great mechanical and scientific force, there are to be provided two engines, each of 550-horse power, with a third engine of equal capacity, to be available in case of accident, or while either of the other engines might require repairs of some duration.

The northern sewage of London (or that of the Middlesex bank of the Thames, covered by that division of the capital) having been thus brought to a sort of central reservoir, or meeting point, will be conveyed in two parallel lines of sewerage to the bank of the river Roding, being the eastern extremity of Gallion's Reach (which is below Woolwich Reach), in the Thames. The Roding flows into the Thames at Barking Creek mouth. The length of this line will be four miles.

"At this point," it is stated in the Report,

Original from HARVARD UNIVERSITY

"the level of the inverts of the parallel sewers will be eight feet below high-water mark, and here it is intended to collect the sewage into a reservoir during the flood-tide, and discharge the same with the ebb-tide immediately after high-water; and, as it is estimated that the reservoir will be completely emptied during the first three hours of the ebb, it may be safely anticipated that no portion of the sewage will be returned, with the flood-tide, to within the bounds of the metropolis."

The whole of the sewage and rainfall, then, will be thus diverted to *one* destination, instead of being issued into the river through a multiplicity of outlets in every part of the northern shore where the population is dense, and will be carried into the Thames at Barking Creek, unless, as I have intimated, a market be found for the sewage; when it may be disposed of as is most advantageous. The only exceptions to this carrying off will be upon the occurrence of long-continued and heavy rains or violent storms, when the surplus water will be carried off by some of the present outlets into the river; but even on such occasions, the *first scour* or cleansings of the sewerage will be conveyed to the main outlet at the river Roding.

The inclination which has been assigned to the whole of the lines of sewers I have described, is, with some unimportant exceptions, 4 feet per mile, or 1 in 1320. These new sewers are, or rather will be, calculated to carry off a fall of rain, equal to ¼ inch in 24 hours, in addition to the average daily flow of sewage.

Mr. Forster concludes his Report:—"I am only able to submit approximately that I estimate the cost of the whole of the lines of sewers, the pumping engines, and station, the reservoir, tidal gates, and other apparatus, at one million and eighty thousand pounds (1,080,000*l*.). This estimate does not include the sums required for the purchase of land and houses, which may be needed for the site of the pumping engine-house, or compensation for certain portions of the lines of sewers."

As regards the improvements in the sewerage on the south side of the Thames (the great fever district of the metropolis, and consequently the most important of all, and where the drainage is of the worst kind), I can be very brief, as nothing has been positively determined.

A somewhat similar system will be adopted on the south side of the Thames, where it is proposed to form one main intercepting sewer; but, owing to the physical configuration of this part of the town, none of the water will flow away entirely by gravitation. There will be a pumping station on the banks of the Ravensbourne, to raise the water about 25 feet; and a second pumping station to raise the water from the continued sewer in the reservoir, in Woolwich Marsh, which is to receive it during the intervals of the tides. The waters are to be discharged into the river at the last-named point. The main sewer on the south side will be of nearly equally colossal proportions; for its total length is proposed to be about 13 miles 3 furlongs, including the main trunk drain of about 2 miles long, and the respective branches. The area to be relieved is about proportionate to the length of the drain; but the steam power employed will be proportionally greater upon the southern than upon the northern side.

There are divers opinions, of course, as to the practicability and ultimate good working of this plan; speculations into which it is not necessary for me to enter. Mr. Forster has, moreover, resigned his office, adding another to the many changes among the engineers, surveyors, and other employés under the Metropolitan Commission; a fact little creditable to the management of the Commissioners, who, with one exception, may be looked upon as irresponsible.

Of the Management of the Sewers and the Late Commissions.

The Corporation of the City of London may be regarded as the first Commission of Sewers in the exercise of authority over such places as regards the removal of the filth of towns. In time, but at what time there is no account, the business was consigned to the management of a committee, as are now the markets of the City (Markets Committee), and even what may be called the management of the Thames (Navigation Committee). It is not at all necessary that the members of these committees should understand anything about the matters upon which they have to determine. A staff of officers, clerks, secretaries, solicitors, and surveyors, save the members the trouble of thought or inquiry; they have merely to vote and determine. It was stated in evidence before a Select Committee of the House of Commons on the subject of the Thames steamers, that at that period the Chairman of the *Navigation* Committee was a bread and biscuit baker, but "a very-firm-minded man." In time, but again I can find no note of the precise date, the *Committee* became a *Court* of Sewers, and so it remains to the present time. Commissions of sewers have been issued by the Crown since the 25th year of the reign of Henry VIII., except during the era of the Commonwealth, when there seems to have been no attention paid to the matter.

As the metropolis increased rapidly in size since the close of the last century, the public sewers of course increased in proportion, and so did Commissions of Sewers in the newly-built districts. Up to 1847 these Commissions or Court of Sewers were *eight* in number, the metropolis being divided into that number of districts.

The districts were as follows:—

1. The City.
2. The Tower Hamlets.
3. St. Katherine.
4. Poplar and Blackwall.
5. Holborn and Finsbury.
6. Westminster and part of Middlesex.
7. Surrey and Kent.
8. Greenwich.

Each of these eight Commissions had its own Act of Parliament; its own distinct, often irregular

Original from HARVARD UNIVERSITY

and generally uncontrolled plan of management; each had its own officers; and each had its own patronage. Each district court—with almost unlimited powers of taxation—pursued its own plans of sewerage, little regardful of the plans of its neighbour Commission. This wretched system—the great recommendation of which, to its promoters and supporters, seems to have been patronage—has given us a sewerage unconnected and varying to the present day in almost every district; varying in the dimensions, form, and inclination of the structures.

The eight commission districts, I may observe, had each their sub-districts, though the general control was in the hands of the particular Court or Board of Commissioners for the entire locality. These subdivisions were chiefly for the facilities of rate-collecting, and were usually "western," "eastern," and "central."

The consequence of this immethodical system has been that, until the surveys and works now in progress are completed, the precise character, and even the precise length, of the sewers must be unknown, though a sufficient approximation may be deduced in the interim.

To show the conflicting character of the sewerage, I may here observe that in some of the old sewers have been found walls and arches crumbling to pieces. Some old sewers were found to be not only of ample proportions, but to contain subterranean chambers, not to say halls, filled with filth, into which no man could venture. While in a sewer in the newly-built district of St. John's-wood, Mr. Morton, the Clerk of Works, could only advance stooping half double, could not turn round when he had completed his examination, but had most painfully—for a long time feeling the effects—to back out along the sewer, stooping, or doubled up, as he entered it. Why the sewer was constructed in this manner is not stated, but the work appears, inferentially, to have been *scamped*, which, had there been a proper supervision, could hardly have been done with a modern public sewer, down a thoroughfare of some length (the Woronzow-road).

But the conflicting and disjointed system of sewerage was not the sole evil of the various Commissions. The mismanagement and jobbery, not to say peculation, of the public moneys, appear to have been enormous. For instance, in the "Accountant's Report" (February, 1848), prepared by Mr. W. H. Grey, 48, Lincoln's-inn-fields, I find the following statements relative to the *Book-keeping* of the several Commissions:—

"The *Westminster* plan is full of unnecessary repetition. It is deficient in those real general accounts which concentrate the information most needed by the Commissioners, and it contains fictions which are very inconsistent with any sound system of book-keeping.

"The ledger of the Westminster Commission does not give a true account of the actual receipt and expenditure of each district.

"The *Holborn and Finsbury* books are still more defective than those of the Westminster Commission. . . . . . There are the same kind of *fictions*. . . . . . But the extraordinary defect in these books consists in the utter want of system throughout them, by keeping one-sided accounts only, in the ledger, with respect to the different sewers in each district, showing only the amount *expended* on each.

"The *Tower Hamlets* books have been kept on a regular system, though by no means one conveying much general information."

"With respect to the *Surrey and Kent* accounts," says Mr. Grey, "the books produced are the most incomplete and unsatisfactory that ever came under my observation. The ledger is always thought to be a *sine quâ non* in book-keeping; but here it has been dispensed with altogether, for that which is so marked is no ledger at all."

Under these circumstances, the Report continues, "It cannot be wondered at that debts should have been incurred, or that they should have swollen to the amount of 54,000*l.*, carrying a yearly interest of 2360*l.*, besides annuities granted to the amount of 1125*l.* a year.

"The *Poplar and Greenwich* accounts (I quote the official Report), confined as they are to mere cash books, offer no subjects for remark. . . . . . .

"No books of account have been produced with respect to the *St. Katherine's* Commission."

On the 16th December, 1847, the new Commissioners ordered all the books to be sent to the office in Greek-street; but it was not until the 21st February, 1848, that all the minute-books were produced. There were no indexes for many years even to the proceedings of the Courts; and the account-books of one of the local Courts, if they might be so called, were in such a state that the book called "ledger" had for several years been cast up in pencil only.

This refers to what may be characterised, with more or less propriety, as *mismanagement* or *neglect;* though in such mismanagement it is hardly possible to escape *one* inference. I now come to what are direct imputations of *Jobbery*, and where *that* is flourishing or easy, no system can be other than vicious.

In a paper "printed for use of Commissioners" (Sept. 7, 1848), entitled "Draft Report on the Surrey Accounts," emanating from a "General Purposes' Committee," I find the following, concerning the parliamentary expenses of obtaining an Act which it was "found necessary to repeal." The cost was, altogether, upwards of 1800*l.*, which of course had to be defrayed out of the taxes.

"This Act," says the Report, "authorized an almost unlimited borrowing of money; and *immediately upon its passing*, in July, 1847, notices were issued for works estimated to amount to 100,000*l.*; and others, we understand, were projected for early execution to the amount of 300,000*l.* . . . . . Considering the general character of the works executed, and from them judging of those projected, it may confidently be averred that the *whole sum* of 300,000*l.*, the progressive expenditure of which was stayed by the 'supersedeas' of the old Commission, would have been *expended in waste.*" [The *Italics* are not those of the Reports.]

The Report continues, "It is to be observed that each of the district surveyors would have participated in the sum of 15,000*l.* percentage on the expenditure for the extension of the Surrey works. Thus the surveyors, with their percentages on the works executed, and the clerk, by the fees on contracts, &c., had *a direct interest in a large expenditure.*"

Instances of the same dishonest kind might be multiplied to almost any extent.

After the above evidences of the incompetency and dishonesty of the several district Commissions —and the Reports from which they are copied contain many more examples of a similar and even worse description—it is not to be wondered at that in the year 1847 the district courts were, with the exception of the City, superseded by the authority of the Crown, and formed into one body, the present Metropolitan Commission of Sewers, of the constitution and powers of which I shall now proceed to speak.

Of the Powers and Authority of the present Commissions of Sewers.

In 1847 the eight separate Commissions of Sewers were abolished, and the whole condensed, by the Government, into *one* Commission, with the exception of the City, which seems to supply an exception in most public matters.

The Act does not fix the number of the Commissioners. To the Metropolitan Commissioners, five City Commissioners are added (the Lord Mayor for the year being one *ex officio*); these have a right to act as members of the Metropolitan Board, but their powers in this capacity are loosely defined by the Act, and they rarely attend, or perhaps never attend, unless the business in some way or other affects their distinct jurisdiction.

The Commissioners (of whom twelve form a quorum) are unpaid, with the exception of the chairman, Mr. E. Lawes, a barrister, who has 1000*l.* a year. They are appointed for the term of two years, revocable at pleasure.

The authority of the City Commission, as distinct from the Metropolitan, for there are two separate Acts, seems to be more strongly defined than that of the others, but the principle is the same throughout. The Metropolitan Act bears date September 4, 1848; and the City Act, September 5, 1848.

The Metropolitan Commissioners have the control over "the sewers, drains, watercourses, weirs, dams, banks, defences, gratings, pipes, conduits, culverts, sinks, vaults, cesspools, rivers, reservoirs, engines, sluices, penstocks, and other works and apparatus for the collection and discharge of rain-water, surplus land or spring-water, waste water, or filth, or fluid, or semi-fluid refuse of all descriptions, and for the protection of land from floods or inundation within the limits of the Commission." Ample as these powers seem to be, the Commissioners' authority does not extend over the Thames, which is in the jurisdiction of the Lord Mayor and Corporation of the City of London; and it appears childish to give men control over "rivers," and to empower them to take measures "for the protection of land from floods or inundation," while over the great metropolitan stream itself, from Yantlet Creek, below Gravesend, to Oxford, they have no power whatever.

The Commissioners (City as well as Metropolitan) are empowered to enforce proper house-drainage wherever needed; to regulate the building of new houses, in respect of water-closets, cesspools, &c.; to order any street, staircase, or passage not effectually cleansed to be effectually cleansed; to remedy all nuisances having insanitary tendencies; to erect *public* water-closets and urinals, free from any charge to the public; to order houses and rooms to be whitewashed; to erect places for depositing the bodies of poor persons deceased until interment; and to regulate the cleanliness, ventilation, and even accommodation of low lodging-houses.

The jurisdiction of the Metropolitan Commissioners of Sewers extends over "all such places or parts in the counties of Middlesex, Surrey, Essex, and Kent, or any of them *not more than twelve miles distant in a straight line from St. Paul's Cathedral, in the City of London,* but not being within the City of London or the liberties thereof."

This, it must be confessed, is an exceedingly broad definition of the extent of the jurisdiction of the *Metropolitan* Commission, giving the Commissioners an extraordinary amount of *latitude.*

In our days there are many Londons. There is the London (or the metropolitan apportionment of the capital) as defined by the Registrar-General. This, as we have seen, has an area of 115 square miles, and therefore may be said to comprise as nearly as possible all those places which are rather more than *five miles* distant from the Post Office.

There is the *Metropolis* as defined by the Post-Office functionaries, or the limits assigned to what is termed the "*London* District Post." This London District Post seems, however, to have three different metropolises:—First, there is the Central Metropolis, throughout which there is an hourly delivery of letters after mid-day, and which deliveries are said to be confined to "*London.*" Then there is the six-delivery *Metropolis*, or that throughout which the letters are despatched and received six times per day; this is said to extend to such of the "environs" as are included within a circle of *three miles* from the General Post Office. Then there is the *six-mile Metropolis* with special privileges. And lastly, the *twelve-mile Metropolis*, which, being the extreme range of the *London* District Post, may be said to constitute the metropolis of the General Post Office.

There is, again, the metropolis of the Metropolitan Commissioners of Police, before the region of rural police and country and parish constables is attained; a jurisdiction which covers 96 square miles, as I have shown at pp. 163-166 of the present volume, and reaches—generally speaking—to such places as are included within a circle of *five miles and a half* from the General Post Office.

There is, moreover, the metropolis, as defined by the Hackney-Carriage Act, which comprises all such places as are within *five miles* of the General Post Office.

And further, there is the Metropolis of the London City Mission, which extends to *eight miles* from the Post Office, and the Metropolis, again, of the London Ragged Schools, which reaches to about *three miles* from the Post Office.

This, however, is not all, for there are divers districts for the registration and exercise of votes, parliamentary, or municipal; there are ecclesiastical and educational districts; there is a thorough complication of parochial, extra-parochial, and chartered districts; there is a world of subdivisions and of sub-subdivisions, so ramified here and so closely blended there, and often with such preposterous and arbitrary distinctions, that to describe them would occupy more than a whole Number.

My present business, however, is the extent of the jurisdiction of the Metropolitan Commissioners of Sewers, or rather to ascertain the boundaries of that *metropolis* over which the Metropolitan Commissioners are allowed to have sway.

The many discrepancies and differences I have explained make it difficult to *define* any district for the London sewerage; and in the Reports, &c., which are presented to Parliament, or prepared by public bodies, little or no care seems to be taken to observe any distinctiveness in this respect.

For instance: The jurisdiction of the Metropolitan Commission of Sewers, which is said to extend to all such places as are not more than 12 miles distant in a straight line from St. Paul's Cathedral, in the City of London, comprises an area of 452 square miles; the metropolis, that of the Registrar-General, presenting a radius of 6 miles (with a fractional addition), contains 115 square miles; yet in official documents 58 square miles, or a circle of about 4½ miles radius, are given as the extent of the *metropolis* sewered by the Metropolitan Commission. By what calculations this 58 miles are arrived at, whether it has been the *arbitrium* of the authorities to consider the sewers, &c., as occupying *the half* of the area of the Registrar-General's metropolis, or what other reason has induced the computation, I am unable to say.

The boundaries of the several metropolises may be indicated as follows:—

The *Three-Mile Circle* includes Camberwell; skirts Peckham; seems to divide Deptford (irregularly); touches the West India Dock; includes portions of Limehouse, Stepney, Bromley, Stratford-le-Bow, and about the half of Victoria-park, Hackney. It likewise comprises a part of Lower Clapton, Dalston, and a portion of Stoke Newington; and closely touching upon or containing small portions of Lower Holloway, and Kentish-town, sweeps through the Regent's and Hyde parks, includes a moiety of Chelsea, and crossing the river at the Red-house, Battersea, completes the circle. This is the six-delivery district of the General Post Office.

In this three-mile district are chiefly condensed the population, commerce, and wealth of the greatest and richest city in the world.

The *Six-Mile Circle* runs from Streatham (on the south); just excludes Sydenham; contains within its exterior line Lewisham, Greenwich, and a part of Woolwich; also, wholly or partially, East Ham, Laytonstone, Walthamstow, Tottenham, Hornsey, Highgate, Hampstead, Kensall-green, Hammersmith, Fulham, Wandsworth, and Upper Tooting. The portion without the three-mile circle, and within the six, is the *suburban* portion or the immediate environs of the metropolis, and still presents rural and woodland beauties in different localities. This may be termed the metropolis of the Registrar-General and Commissioners of Metropolitan Police.

The *Twelve-Mile Circle*, or the extent of the jurisdiction of the *Metropolitan* Commissioners of Sewers, as well as the "*London* District Post," includes Croydon, Wickham, Paul's Cray, Foot's Cray, North Cray, and Bexley; crosses the river at the Erith-reach; proceeds across the Rainham-marshes; comprises Dagenham; skirts Romford; includes Henhault-forest and the greater portion of Epping-forest; touches Waltham-abbey and Cheshunt; comprehends Enfield and Chipping-Barnet; runs through Elstre and Stanmore; comprehends Harrow-on-the-Hill, Norwood, and Hounslow; embraces Twickenham and Teddington; seems to divide somewhat equally the domains of Bushey-park and of Hampton-court Palace; then, crossing the river about midway between Thames Ditton and Kingston, the boundary line passes between Cheam and Ewell, and completes the circuit.

Over this large district, then, the jurisdiction of the Metropolitan Commissioners of Sewers is said to extend, and one of the outlets of the *London* sewers has already been spoken of as being situate at Hampton. The district yielding the amount of sewage which is assumed as being the gross wet house-refuse of the metropolis is, as we have seen, taken at 58 square miles, and is comprised within a circle of about 4½ miles radius; this reaches only to Brixton, Dulwich, Greenwich, East India Docks, Layton, Highgate, Hampstead, Bayswater, Kensington, Brompton, and Battersea. The actual jurisdiction of the Commissioners is, then, nearly eight times larger than the portion to which the estimated amount of the sewage of the metropolis refers.

The metropolitan district is still distinguished by the old divisions of the Tower Hamlets, Poplar and Blackwall, Holborn and Finsbury, Westminster, &c.; but many of these divisions are now incorporated into one district; of which there would appear to be but four at present; or five, inclusive of the City.

These are as follows:—

1. Fulham and Hammersmith, Counter's Creek and Ranelagh districts.

2. Westminster (Eastern and Western), Regent-street, and Holborn.

3. Finsbury, Tower Hamlets, Poplar, and Blackwall.

4. Districts south of the Thames, Eastern and Western.

5. City.

The practical part or working of the Commis-

sion of Sewers is much less complicated at present than it was in the times of the independent districts and independent commissions.

The orders for all work to be done emanate from the court in Greek-street, but the several surveyors, &c. (whose salaries, numbers, &c., are given below), can and do order on their responsibility any repair of a temporary character which is evidently pressing, and report it at the next court day. The Court meets weekly and monthly, and what may be styled the heavier portion of the business, as regards expenditure on great works, is more usually transacted at the monthly meetings, when the attendance is generally fuller; but the Court can, and sometimes does, meet much more frequently, and sometimes has adjourned from day to day.

Any private individual or any public body may make a communication or suggestion to the Court of Sewers, which, if it be in accordance with their functions, is taken into consideration at the next accruing court day, or as soon after as convenient. The Court in these cases either comes to a decision of adoption or rejection of any proposition, or refers it to one of their engineers or surveyors for a report, or to a committee of the Commissioners, appointed by the Court; if the proposition be professional, as to defects, or alleged and recommended improvements in the local sewers, &c., it is referred to a professional gentleman for his opinion; if it be more general, as to the extension of sewerage to some new undertaking or meditated undertaking in the way of building new markets, streets, or any places, large and public; or in applications for the use and appropriation by enterprising men of sewage manure, it is referred to a committee.

On receiving such reports the Court makes an order according to its discretion. If the work to be done be extensive, it is entrusted to the chief engineer, and perhaps to a principal surveyor acting in accordance with him; if the work be more local, it is consigned to a surveyor. One or other of these officers provides, or causes to be prepared, a plan and a description of the work to be done, and instructs the clerk of the works to procure estimates of the cost at which a contractor will undertake to execute this work, or, as it is often called by the labouring class, to "complete the *job*" (a word at one time singularly applicable). The estimates are sent by the competing builders, architects, general speculators, or by any one wishing to contract, to the court house (without the intervention of any person, officially or otherwise) and they are submitted to the Board by their clerk. The lowest contract, as the sum total of the work, is most generally adopted, and when a contract has been accepted, the matter seems settled and done with, as regards the management of the Commissioners; for the contractor at once becomes responsible for the fulfilment of his contract, and may and does employ whom he pleases *and at what rates he pleases*, without fear of any control or interference from the Court. The work, however, is superintended by the surveyors, to ensure its execution according to the provisions of the agreement. The contractor is paid by direct order of the Court.

The surveyors and clerks of works are mostly limited as to their labours to the several districts; but the superior officers are employed in all parts, and so, if necessary, are the subordinate officers when the work requires an extra staff.

According to the Returns, the following functionaries appear to be connected with the undermentioned districts:—

Fulham, Hammersmith, Counter's Creek, and Ranelagh.
1 Surveyor.
3 Clerks of the Works.
1 Inspector of Flushing.

Eastern and Western Divisions of Westminster and Regent-street.
1 Surveyor, who has also the Holborn division to attend to.
2 Clerks of the Works.
6 Flap and Sluice keepers.

Holborn.
2 Clerks of the Works.
1 Inspector of Flushing.

Finsbury.
1 Clerk of the Works.
1 Inspector of Flushing.

Tower Hamlets, and Poplar and Blackwall.
1 Surveyor, who has also the Finsbury division included in his district.
2 Clerks of the Works.
2 Inspectors of Flushing.

South of the Thames.
Western Districts.
1 Surveyor.
2 Clerks of the Works.
2 Inspectors of Flushing.

Eastern Districts.
1 Surveyor.
2 Clerks of the Works.
2 Inspectors of Flushing.

What may be called the working staff of the Metropolitan Commissioners consists of the following functionaries, receiving the following salaries:—

	£	s.
Chairman, with a yearly salary of	1,000	0
Secretary, with a yearly salary of (besides an allowance of £100, in lieu of apartments)	800	0
Clerk of minutes	350	0
Two clerks of do., (each with a salary of £150)	300	0
One do., with a salary of	120	0
One do. do.	105	0
One do. do.	95	0
One do. do.	90	0
Accountant do.	350	0
Accountant's clerk do.	150	0
Do do.	80	0
Clerk of surveyors' and contractors' accounts	200	0
Do. do.	125	0
Do. do.	110	0
Clerk of rates	250	0
Another do.	180	0
Do. do.	110	0
Do. do.	90	0
Engineer	1,000	0
For travelling expenses	200	0
Surveyor for Fulham and Hammersmith, Counter's Creek, and Ranelagh districts	350	0
Clerk of works (Hammersmith)	150	0
Do. (Counter's Creek)	150	0
Do. (Ranelagh)	150	0
Inspector of flushing	80	0
Surveyor of eastern and western divisions of Westminster, and of Regent-st. and Holborn divisions	300	0
Two clerks of works (eastern and western and Regent-street), with a salary of £300 each	600	0
Two do. (Holborn), with a salary of £100 each	200	0
Inspector of flushing	80	0
Surveyor of Finsbury, Tower Hamlets, and Poplar and Blackwall	300	0
Clerk of works (Finsbury)	150	0
Inspector of flushing	40	0
Two clerks of works (Tower Hamlets, and Poplar and Blackwall), with a salary of £150 each	300	0
Two inspectors of flushings with a salary of £80 each	160	0
One marsh bailiff	65	0

	£	s.
Surveyor of the western districts south of the Thames	300	0
Do., eastern do.	250	0
Clerk of works (eastern portion)	164	0
Two inspectors of flushing, £80 each............	160	0
One wallreeve ..	22	6
Clerk of works (western portion)	164	0
Do. do.	150	0
Two inspectors of flushing, with a salary of £80 each............	160	0
Two engineer's clerks, with a salary of £150 each............	300	0
One do.	150	0
One do.	100	0
One do.	80	0
One by-law clerk	150	0
Twenty-two flap and sluice keepers	892	12
Surveyor (of the surveying and drawing staff) ..	280	0
Drawing clerk ..	150	0
Two do., with a salary of £130 each	260	0
Five do., with a salary of £105 each	525	0
One do...........	50	0
Six surveyors, with a salary of £100 each	600	0
Six chainmen, 18s. a week each	280	0
Office-keeper and crier (general service)	120	0
Bailiff, &c.	100	0
Strong-room keeper	80	0
One messenger ..	70	0
Two do., £40 each	80	0
Three errand-boys, £32 each..	96	0
Housekeeper	150	0
Yearly total	£13,874	0

This is called a "reduced" staff, and the reduction of salaries is certainly very considerable.

If we consider the yearly emoluments of tradesmen in businesses requiring no great extent of education or general intelligence, the salaries of the surveyors, clerk of the works, &c., must appear very far from extravagant; and when we consider their responsibility and what may be called their removability, some of the salaries may be pronounced mean; for I think it must be generally admitted by all, except the narrow-minded, who look merely at the immediate outlay as the be-all and the end-all of every expenditure, that if the surveyors, clerks of works, inspectors of flushing, &c., be the best men who could be procured (as they ought to be), or at any rate be thorough masters of their craft, they are rather underpaid than overpaid.

The above statement may be analysed in the following manner:—

	£	s.	£
Chairman			1,000
Secretary and 7 clerks .	1860	0	
Accountant and 5 clerks .	1015	0	
Clerk of rates and 3 clerks	630	0	
			3,505
Engineer and 5 clerks .	1830	0	
7 surveyors, of surveying and drawing staff, with 6 chainmen and 9 drawing clerks	2125	0	
5 district surveyors .	1500	0	
12 clerks of works .	2278	0	
9 inspectors of flushing	720	0	
22 flap and sluice keepers	892	12	
Bailiff, marsh-bailliff, and wallreeve	187	8	
			9,533
Office keeper, strong-room keeper, and housekeeper .	350	0	
3 messengers and 3 errand-boys	246	0	
			596
			£14,634

The cost of rent, taxes, stationery, and office incidentals, is now 4440*l.*, which makes the total yearly outlay amount to upwards of 19,000*l.* The annual cost of the staff in the secretary's department is said to have been reduced from 3962*l.* 4*s.* to 3605*l.*; in the engineers' department from 16,437*l.* 3*s.* to 8973*l.* 16*s.* In the general service there has been an increase from 606*l.* 16*s.* to 696*l.*

A deputation who waited lately upon Lord John Russell is said to have declared the expenses of the Commissioners' office to be at the rate of from 25 to 30 per cent. on the amount of rate collected. The sum collected in the year 1850 averaged 89,341*l.* The cost of management in that year was 23,465*l.*; this, it will be seen, is 26 per cent of the gross income.

The annual statement of the receipts and expenditure under the Commission for the year 1851 has just been published, but not *officially*; from this it appears that in February, 1851—

	£	s.	d.
The balance of cash in hand was	5,750	9	11
The total receipts during the year have amounted to . .	129,000	0	9
Making together . . .	134,750	10	8

The expenditure, as returned under the general head, is—

	£	s.	d.
For work . . . . . (This item includes the cost of supervision and compensation for damages.)	£95,539	19	3
The cost of surveys has been	6,332	19	9
Management . . .	16,430	9	2
Loans	10,442	10	2
Contingencies . . .	2,749	1	1
Total payments . . .	131,494	19	5
Balance in hand . .	£3,355	11	8

As an instance of the mismanagement of the sewers work of the metropolis, it is but right that the subjoined document should be published.

I need not offer any comment on the following "Return to an Address of the Honourable the House of Commons, dated 28th July, 1851," except that I was told early in January, on good authority, that the matter was now worse than it was when reported as follows:—

"*Privy Gardens, Whitehall Yard, Scotland Yard, &c., Public Sewer.*

"With reference to the two orders of the Commissioners of Her Majesty's Woods, &c., I have the honour to state that, since the 15th of November (when I last sent in a memorandum), I have frequently visited the several Crown buildings affected by the building of the main public sewer

Original from HARVARD UNIVERSITY

for draining Westminster; viz., the Earl of Malmsbury's, the Exchequer Bill Office, the United Service Museum, Lord Liverpool's, Mr. Vertue's, Mr. Alderman Thompson's, and Messrs. Dalgleish's.

"All these buildings have been more or less damaged by the construction of the sewer; the Exchequer Bill Office, the United Service Museum, and Mr. Vertue's, in a manner that, in my opinion, can *never be effectually repaired.*

"At Lord Malmsbury's, the party wall next to the Exchequer Bill Office has *moved*, as shown by some cracks in the staircase; but for this house it may not be necessary to require more to be done than stopping and painting.

"At the Exchequer Bill Office, the old Gothic groins have been cracked in several places, and several settlements have taken place in the walls over and near to where the sewer passes under the building. The shores are still standing against this building, but it would now be better to remove them; the cracks in the groins and walls *can never be repaired* to render the building so substantial as it was before. The cracks in the basement still from month to month show a very slight movement; those in the staircase and roof also appear to increase. As respects this building, I would submit to the Commissioners of Woods that it *would not be advisable to permit the surveyors of the Commissioners of Sewers to enter and make only a surface repair of plaster and paint*; but I would suggest that a careful survey be made by surveyors appointed respectively by the Board of Woods and the Commissioners of Sewers, and that a thorough repair of the building be made (so far as it is susceptible of repair), under the Board of Woods; the Commissioners of Sewers paying such proportion of the cost thereof as may fairly be deemed to have been occasioned by their proceedings.

"At the United Service Museum, the settlements on the side next the sewer appear to me very serious.

"The house occupied by Lord Liverpool, as also Mr. Vertue's house, of which his Lordship is Crown lessee, were both affected, the former to some extent, but not seriously; of the latter, the west front sunk, and pulled over the whole house with it; but as respects these two houses the interference of the Board is, I believe, unnecessary, Mr. Hardwicke (one of the Sewer Commissioners) having, as architect for Lord Liverpool, caused both to be repaired.

"A like repair has also been made in the kitchen offices of Mr. Alderman Thompson's house, where alone any cracks appeared.

"At Messrs. Dalgleish and Taylor's, very serious injury has been done to both their buildings and their trade. The Commissioners of Sewers have a steam-engine still at work on those premises, and have not yet concluded their operations there. Some of the sheds which entirely fell down they have rebuilt; and others, which appear in a very defective if not dangerous state, it is understood they propose to repair or rebuild; but as eventually Messrs. Dalgleish and Taylor will have a very heavy claim against them for interference with business, and as the extent of damage to the buildings which has been done, or may hereafter arise, cannot at present be fully ascertained, it would probably be advisable to postpone this part of the subject, giving notice, however, to the Commissionors of Sewers that it must hereafter come under consideration.

(Signed) "JAMES PENNETHORNE.

"10th May, 1851."

"*Sewer, Whitehall Yard, &c.*

"Under the order of the Commissioners of Her Majesty's Woods, &c., of yesterday's date, endorsed on a letter from Mr. Tonna, I have inspected the United Service Institution in Whitehall Yard, and find most of the cracks have moved.

"The movement, though slight, and not showing immediate danger, is more than I had anticipated would occur within so short a period when I reported on the 10th instant. It tends to confirm the opinion therein given, and shows the necessity for immediate precaution, and for a thorough repair.

(Signed) "JAMES PENNETHORNE.

"16th May, 1851.

"CHARLES GORE, } Commissioners of Her Majesty's Woods, Forests, Land Revenues, Works, and Buildings.

"Office of Woods, &c.

"5th August, 1851."

OF THE SEWERS RATE.

HAVING shown the expenditure of the Commission of Sewers, we now come to consider its income.

The funds available for the sewerage and drainage of the several towns throughout the kingdom, are raised by means of a particular property tax, termed the Sewers Rate. This forms part of what are designated the *Local* Taxes of England and Wales.

Local taxes are of two classes:—

I. Rates raised upon property in *defined* districts, as parishes, jurisdictions, counties, &c.

II. Tolls, dues, and fees charged for particular services on particular occasions, as turnpike tolls, harbour dues, &c., &c.

The rates or sums raised upon the property lying within a certain circumscribed locality, admit of being subdivided into two orders—

1. The rates of *independent* districts, or those which, being required for a particular district (as the parish or some equivalent territorial limit), are not only levied within the bounds of that district, but expended for the purposes of it alone; as is the case with the poor rate.

2. The rates of *aggregate* districts, or those which, though required to be expended for the purposes of a given district (such as the county), are raised in detail in the several inferior districts (such as the various parishes) which compose the larger one, and which contribute the sums thus levied to one common fund; such is the case with the county rate.

Original from HARVARD UNIVERSITY

But the rates of independent districts may be further distinguished into two orders, viz.—

i. Those which are levied on the same classes of persons, the same kinds of property, and the same principles of valuation as the poor rate; such are the highway rate, the lighting and watching, and the militia rate among the independent rates; and the police, borough, and county rates among the aggregate rates.

ii. Those which are *not* levied on the same basis as the poor rate. The church and sewers rates are familiar instances of this peculiarity.

The sewers rate, then, is a local tax required for an *independent* rather than an *aggregate* district, and is *not* levied upon the basis of the poor law.

The assessment of the poor rate, for instance, includes tithes of every kind, that of the sewers rate extends to such tithes only as are in the hands of laymen. Again, the sewers rate embraces some incorporeal hereditaments to which the poor rate does not extend; but stock in trade, which of late years has been specially exempted from the poor rate, was never subject to the sewers rate.

A sewers rate, however, was known as early as the sixth year of Henry VI. (1427), though "commissions" were not instituted till the time of Henry VIII. The Act which now regulates the collection of the funds required for the cleansing, building, repairs, and improvements of the sewers, is 4 and 5 Vict. (1841). This statute gives the "Courts" or "Commissions" of Sewers, power "to tax in the gross" in each parish, &c., all lands, &c., within the jurisdiction of such courts, for the requirements of the public sewerage. This impost is not periodically levied, nor at any stated or even regularly recurring term, but "as occasion requires:" perhaps once in two or three years. It is (with some exceptions, which require no notice) what is commonly called "a landlord's tax" in the metropolis, that is, the sewers-rate collector must be paid by the occupier of the premises, who, on the production of the collector's receipt, can deduct the amount from his rent. If this arrangement were meant to convey a notion to the public that the sewers tax was a tax on property—on the capitalist who owns, and not on the tenant who merely occupies—it is a shallow device, for every one must know that the more sewers rate a tenant pays *for* his landlord, the more rent he must pay *to* him.

The sewers rate is levied according to the rateable value put upon property by the surveyors and assessors appointed by the Commissioners, who may make the rate "by such ways and means, and in such manner and form, as to them may seem most convenient." It seems a question yet to be determined whether or not there is a right of appeal against the sewers rate, but the general opinion is that there is *no appeal*. The rate can be mortgaged by the Commissioners if an advance of money is considered desirable. The maximum of 1*s.* in the pound on the net annual value of the property was fixed by the Act. The Commissioners have also the power to levy a "special rate" on any district not connected with the general system of sewerage, but which it has been resolved should be so connected; also an "improvement rate." at a maximum of 10 per cent. on the rack rent, "in respect of works they may judge to be of private benefit," a provision which has called forth some comments.

The metropolitan sewers rate is now collected in nine districts.

There are at present 42 Commissions or Courts of Sewers throughout England and Wales.

The only return which has yet been prepared of the annual amount assessed and collected under the authority of the Metropolitan Commission of Sewers, is one presented to the House of Commons in 1843. It includes the sum assessed in four of the eight districts within the jurisdiction of the Metropolitan Commissioners from 1831 to 1840 inclusive.

Districts.	Total in the 10 years.	Annual Average.
	£	£
Westminster . .	235,397	23,539$\frac{7}{10}$
Holborn and Finsbury	123,317	12,331$\frac{7}{10}$
Tower Hamlets . .	82,468	8,246$\frac{8}{10}$
From East Moulsey, in Surrey, to Ravensbourne, in Kent .	175,137	17,513$\frac{7}{10}$
	616,319	61,631$\frac{9}{10}$

The following amounts were returned to Parliament as that expended in two other of the metropolitan districts in the year 1833:—

In the City	£17,718$\frac{2}{10}$
Poplar district	2,746$\frac{9}{10}$
	£20,465$\frac{1}{10}$
Annual average of the four above-mentioned districts . . .	61,631$\frac{9}{10}$
Yearly total	£82,097

The two districts excluded from the above total are the minor ones of St. Katherine and Greenwich, so that altogether the gross sum levied within the jurisdiction of the Metropolitan Commissioners must have been between 85,000*l.* and 90,000*l.*

The annual amount of the local rates in England and Wales is, according to a work on the subject ("The Local Taxes of the United Kingdom"), published "under the direction of the Poor Law Commissioners" in 1846, 8,801,838*l.* * In this large sum only the average annual outlay on the six districts of the sewers of the metropolis is included (82,097*l.*), and it is stated that not even an approximate average could be arrived at as regards the expenditure on sewers in the country districts. Such absence of statistical knowledge,—and it is a want continually observable—is little creditable to the legislative, executive, and administrative powers of the State.

I shall now proceed to show, from the best data at my command, the present outlay on the metropolitan sewers.

* The following statement may, according to the work above alluded to, be presented as an approximate

According to the present law, the Commissioners are required to submit to Parliament yearly returns of the money collected on account of, and expended in, the sewerage of the metropolis.

I need only state, that in the latest and, indeed, the sole returns upon the subject, the rates in 1845-6-7, under the former separate commissions, were 1*d.* and 2*d.* in the pound on land, and from 3*d.* (Ranelagh and Westminster) to 1*s.* 10*d.* (Greenwich) on houses.

The rates made under the combined and consolidated Commissions, from 30th Nov., 1847, to 8th Oct., 1849, were all 6*d.*, excepting the Western division of Westminster sewers, which were 3*d.*, and a part of the Surrey and Kent district, 8*d.*

The rates under the present Metropolitan Commission, from 8th October, 1849, to 31st July, 1851, are all 6*d.*, with a similar exception in Surrey and Kent. The following are the only further returns bearing immediately on the subject:—

RETURN OF THE PERCENTAGE ON THE TOTAL RATEABLE ANNUAL VALUE OF THE PROPERTY ASSESSED, to which the Rates collected under the separate COMMISSIONS, between January, 1845, and November, 1847, amounted; SIMILAR RETURN as to the combined and consolidated COMMISSIONS, from November, 1847, to October, 1849; and as to the present COMMISSION, from October, 1849, to July 31, 1851.

——	Total Rateable Annual Value of the Districts on November 30, 1847, and October 8, 1849, and July 31, 1851, respectively.	Average Amount collected for One Year.	Amount of the Percentage of the Rates collected on the Rateable Annual Value.
	£ s. d.	£ s. d.	£ s. d.
Under the old separate Commissions of Sewers, between January, 1845, and November 30, 1847	6,683,896 0 0	81,738 11 0	1 4 5 or $2\frac{3}{4}d$. ·72 in the pound per annum.
Under the combined and consolidated Commissions, from November 30, 1847, to October 8, 1849 (including first Metropolitan Commission)	7,128,111 0 0	67,707 16 3	0 18 $11\frac{3}{4}$ or $2\frac{1}{4}d$. ·11 in the pound per annum.
Under the present Metropolitan Commission of Sewers, from October 8, 1849, to July 21, 1851	8,135,090* 0 0 8,820,325† 0 0	89,341 16 0	1 1 11 or $2\frac{1}{2}d$. ·52 in the pound per annum. 1 0 3 or $2\frac{1}{4}d$. ·72 in the pound per annum.

* Rental of the districts now rated.
† Rental of the districts within the active jurisdiction in which expenses have been incurred, and which are about to be rated.

AUGUST, 1851.

THOMAS COGGIN,
Clerk of Rates and Collections.

return of the present annual amount of the local rates in England and Wales.

I. RATES.

A. RATES OF INDEPENDENT DISTRICTS.

1. *On the basis of the poor rate.*

The poor rate, including the purposes of—	
The workhouse building rate / The survey and valuation rate / Relief of the poor	£4,976,093
Other objects	567,567
Contributions to county and borough rates (see below).	
Jail fees rate / Constables rate	unknown
Highway rates	1,312,812
Lighting and watching rate	unknown
Militia rate	not needed
2. *Not on the basis of the poor rate.*	
Church rates	506,819
Sewers rate—	
General sewers tax—	
In the metropolis	82,097
In the rest of the country	unknown
Drainage and inclosure rates / Inclosure rate / Regulated pasture rate	unknown
B. RATES OF AGGREGATE DISTRICTS.	
County rates / Hundred rate / Borough rates — Contributed from the poor rate.	1,336,457
Total rates of England and Wales	£8,801,834

The amount of the taxation in the shape of tolls, dues, and fees is as follows:—

II. TOLLS, DUES, AND FEES.

Turnpike tolls		£1,348,085
Borough tolls and dues	£172,911	
City of London	205,100	
		378,011
Light dues		257,776
Port dues		554,645
Church dues and fees / Marriage fees / Registration fees		unknown
Justiciary fees—		
Clerks of the Peace	£11,057	
Justices' clerks	57,668	
		68,725
Total tolls, dues, and fees of England and Wales		£2,607,241

The subjoined, then adds the same work, founded on the preceding details, may be regarded as exhibiting an approximate estimate of the present amount of the local taxes in England and Wales, *being, however, obviously below the actual total.*

Rates	£8,801,838	
Tolls, dues, and fees	2,607,241	
		£11,409,079

"The annual amount of the local taxation of England and Wales may at the present time be stated, in round numbers, at not less than £12,000,000;" or we may say that the local taxation of the country is one-fourth of the amount of the general taxation.

RETURN OF THE COST OF MANAGEMENT PER ANNUM ON THE TOTAL RATEABLE ANNUAL VALUE OF THE DISTRICTS.

YEARS.	Total Rateable Annual Value of the Districts.			Cost of Management per Annum.			Rate per Cent. per Annum of Cost of Management on the Rateable Annual Value of the Districts.		
	£	s.	d.	£	s.	d.	£	s.	d.
1845	6,320,331	0	0	18,591	4	3	0	5	10½
1846	6,423,909	0	0	18,097	5	1	0	5	7½
1847	6,683,896	0	0	24,371	16	9	0	7	3½
1848	6,783,111	0	0	20,008	7	10	0	5	10¾
1849	8,077,591	0	0	20,005	7	6	0	4	11½
1850	8,791,967	0	0	23,465	18	7	0	5	4

G. S. HATTON,
Accountant.

August 7, 1851.

Of the Cleansing of the Sewers—Ventilation.

There are two modes of purifying the sewers; the one consists in removing the foul air, the other in removing the solid deposits. I shall deal first with that mode of purification which consists in the mechanical removal or chemical decomposition of the noxious gases engendered within the sewers.

This is what is termed the Ventilation of the Sewers, and forms a very important branch of the inquiry into the character and working of the underground refuse-channels, for it relates to the risk of explosions and the consequent risk of destruction to men's lives; while, if the sewer be ill-ventilated, the surrounding atmosphere is often prejudicially affected by the escape of impure air from the subterranean channels.

A survey as to the ventilation, &c., of the sewers was made by Mr. Hawkins, Assistant-Surveyor, and Mr. Jenkins, Clerk of the Works. Four examinations took place of sewers; of those in Bloomsbury; those from Tottenham-court-road to Norfolk-street, Strand; from the Guard-room in Buckingham Palace to the Horseferry-road, Millbank; and in Grosvenor-square and the streets adjacent. There were difficulties attending the experiment. From Castle-street to Museum-street there was a drop of 4 feet in the levels, so that the examiners had to advance on their hands and knees, and it was difficult to make observations. In some places in Westminster also the water and silt were knee deep, and the lamps (three were used) splashed all over. In Bloomsbury the sewers gave no token of the presence of any gas, but in the other places its presence was very perceptible, especially in a sewer on the west side of Grosvenor-square, a very low one, in which the gas was ignited within the wire shade of one of the lamps, but without producing any effect beyond that of immediately extinguishing the light. There was also during the route, in the neighbourhood of Sir Henry Meux's brewery and of an adjoining distillery in Vine-street, a considerable quantity of steam in the sewer, but it had no material effect upon the light.

The examiners came to the conclusion that where there was any liability to an explosion from the presence of carburetted hydrogen, or other causes, the Improved Davy Lamp afforded an almost certain protection.

The attention of the Commissioners seems to have been chiefly given of late, as regards ventilation and indeed general improvement, to the sewers on the Surrey side of the metropolis. Among these a new sewer along Friar-street, running from the Blackfriars to the Southwark-bridge-road, is one of the most noticeable.

Friar-street is one of the smaller off thoroughfares, the character of which is, perhaps, little suspected by those who pass along the open Blackfriars-road. As you turn out of that road to the left hand, advancing from the bridge, almost opposite the Magdalen Hospital, is Friar-street. On its left hand, as you proceed along it, are gas-works, and the factories, or work places, of tradesmen in the soap-boiling, tallow-melting, cat and other gut manufacturing, bone-boiling, and other noisome callings. On the right hand are a series of short and often neatly-built streets, but the majority of them have the look of unmistakable squalor or poverty, though *not* of the poverty of the industrious. Across Flint-street, Green-street, and other ways, few of them horse thoroughfares, hang, on a fair day, lines of washed clothes to dry. Yellow-looking chemises and petticoats are affixed alongside men's trowsers and waistcoats; coarse-featured and brazen-looking women, with necks and faces reddened, as if with brick-dust, from exposure to the weather, stand at their doors and beckon to the passers by. Perhaps in no part of the metropolis is there a more marked manifestation of moral obsceneness on the one hand, and physical obsceneness on the other. With the low prostitution of this locality is mixed the low and the bold crime of the metropolis. Some of the off-shoots from Friar-street communicate with places of as nefarious a character. Hackett, whom his newspaper admirers seem to wish to elevate into the fame of a second Jack Sheppard, resided in this quarter. The gang who were last winter repulsed in their burglarious attack on Mr. Holford's villa in the Regent's-park favoured the same locality, and were arrested in their old haunts. Public-houses may

be seen here and there—houses, perhaps, not greatly discouraged by the police—which are at once the rendezvous and the trap of offenders, for to and from such resorts they can be readily traced. And all over this place of moral degradation extends the stench of offensive manufactures and ill-ventilated sewers. Certainly there is now an improvement, but it is still bad enough.

A Report of the 21st September, 1848, shows that a new sewer, 1500 feet in length, had been "put in along Friar-street, with a fall of 15 inches from the level of the sewer in Blackfriars-road to Suffolk-street. The sewer," states the Report, "with which it communicates at its upper end in the Blackfriars-road contains nearly 2 feet in depth of soil; it in consequence has silted up to that level with semi-fluid black filth, principally from the factories, of the most poisonous and sickening description, forming an *elongated cesspool* 1500 feet in length, the filth at its lower end being upwards of 3 feet in depth. Since the building of this sewer, the foul matter so discharged into it has been in a state of decomposition, constantly giving off pestilential and poisonous gases, which have spread into and filled the adjoining sewers; thence they are being drawn into the houses by the house-drains, and into the streets by the street-drains, to such a fearful extent as to infect the whole atmosphere of the neighbourhood, and so to cause the very offensive odour so generally complained of there. Sulphuretted hydrogen is present in these sewers in large quantities, as metals, silver and copper, are attacked and blackened by it; and the smell from it is so sickening as to be almost unbearable."

On the question of how best to deal with sewers such as the Friar-street, Messrs. John Roe and John Phillips (surveyors) and Mr. Henry Austin (consulting engineer) have agreed in the following opinion:—

"The most simple and convenient method would be by placing large strong fires in shafts directly over the crown of the sewers. The expense of each furnace, with the inclosure around it, will be about 20*l*. The fires would be fed almost constantly, by which little smoke would be generated. The heat to be produced from these fires would rarefy the air so much as to create rapidly ascending currents in the shafts, and strong draughts through the sewers, the foul air in which would then be drawn to the fires and there consumed; and as it was being destroyed fresh air would be drawn in at all the existing inlets of house and street drains, pushing forward and supplying the place of the foul air."

Concerning the explosions of, or deaths in, the sewers from the impure gases, there is, I believe, no statistical account. The most remarkable catastrophe of this kind was the death of five persons in a sewer in Pimlico, in October, 1849; of these, three were regular sewer-men, and the others were a policeman and Mr. Wells, a surgeon, who went into the sewer in the hopes of giving assistance. Mr. Phillips, the then chief surveyor of the Commission of Sewers, stated that the cause of these deaths in the sewers was entirely an exceptional case, and the gas which had caused the accident inquired into was not a sewer gas. "There is often," he said, "a great escape of gas from the mains, which found its way into the sewers. The gas, however, which has done the mischief in the present instance would not explode."

Dr. Ure's opinion was, that the deceased men died from asphixia, caused by inhaling sulphuretted hydrogen and carbonic acid gas in mixture with prussic vapour, and that these noxious emanations were derived from the refuse lime of gas-works thrown in with other rubbish to make up the road above the sewer. Other scientific gentlemen attributed the five deaths to the action of sulphuretted hydrogen gas, or, according to Dr. Lyon Playfair, to be chemically correct, hydro-sulphate of ammonia. The coroner (Mr. Bedford), in summing up, said that Mr. Phillips wished it to be supposed that gas lime was the cause of the foul gas; and Dr. Ure said that gas lime had to do with the calamity. But Dr. Miller, Mr. Richard Phillips, Mr. Campbell, and Dr. Playfair, more especially the latter, were perfectly sure that lime had nothing to do with it. The verdict was the following:—"We find that Daniel Pert, Thomas Gee, and John Attwood died from the inhalation of noxious gas generated in a neglected and unventilated sewer in Kenilworth-street. And we find that Henry Wells and John Walsh met their deaths from the same cause, in their laudable endeavours to save the lives of the first three sufferers. The jury unanimously consider the commissioners and officers of the Metropolitan Sewers are much to blame for having neglected to avail themselves of the unusual advantages offered, from the local situation of the Grosvenor-canal, for the purpose of flushing the sewers in this district."

Of "Flushing" and "Plonging," and other Modes of Washing the Sewers.

The next step in our inquiry—and that which at present concerns us more than any other—is the mode of removing the solid deposits from the sewers, as well as the condition of the workmen connected with that particular branch of labour. The sewers are the means by which a larger proportion of the wet refuse of the metropolis is removed from our houses, and we have now to consider the means by which the more solid part of this refuse is removed from the sewers themselves. The latter operation is quite as essential to health and cleanliness as the former; for to allow the filth to collect in the channels which are intended to remove it, and there to remain decomposing and vitiating the atmosphere of the metropolis, is manifestly as bad as not to remove it at all; and since the more solid portions of the sewage *will* collect and form hard deposits at the bottom of each duct, it becomes necessary that some means should be devised for the periodical purgation of the sewers themselves.

There have been two modes of effecting this object. The one has been the *carting* away of the more solid refuse, and the other the *washing* of it away, or, as it is termed, *flushing* in the case

of the *covered* sewers, and *plonging* in the case of the *open* ones. Under both systems, whether the refuse be carted or flushed away, the hard deposit has to be first loosened by manual labourers—the difference consisting principally in the means of after-removal.

The first of these systems—viz., the cartage method—was that which prevailed in the metropolis till the year 1847. I shall therefore give a brief description of this mode of cleansing the sewers before proceeding to treat of the now more general mode of "flushing."

Under the old system, the clearing away of the deposit was a "nightman's" work, differing little, except in being more toilsome, offensive to the public, and difficult. A hole was made from the street down into the sewer where the deposit was thickest, and the deposit was raised by means of a tub, filled below, drawn up to the street, and emptied into a cart, or spread in mounds in the road to be shovelled into some vehicle. A nightman told me that this mode of work was sometimes a great injury to his trade, because "when it was begun on a night many of the householders sleeping in the neighbourhood used to say to themselves, or to their missusses, as they turned in their beds, 'It's them ere cussed cesspools again! I wish they was done away with.' An' all the time, sir, the cesspools was as hinnocent and as sweet as a hangel."

This clumsy and filthy process is now but occasionally resorted to. A man who had superintended a labour of this kind in a narrow, but busy thoroughfare in Southwark, told me that these sewer labourers were the worst abused men in London. No one had a good word for them.

But there have been other modes of removing the indurated sewage, besides that of cartage; and which, though not exactly flushing, certainly consisted in allowing the deposit to be washed away. Some of these contrivances were curious enough.

I learn from a Report printed in 1849, that the King's Scholars' Pond Sewer, in the city of Westminster, running near the Abbey, contained a continuous bed of deposit, of soil, sand, and filth, from 10 to 30 inches in depth, and this for a mile and a half next the river—the first mile yielding more than 6000 loads of matter. This sewer was to be cleansed.

"We first used a machine," says Mr. J. Lysander Hale, "in the form of a plough and harrow combined; a horse dragged it through the deposit in the sewer; one man attended the horse, and another guided the plough. The work done by this machine, in cutting a channel through the soil and causing the water to move through it quickly, was effectual to remove the deposit; but as the sewer is a tidal sewer, and its sole entrance for a horse being its outlet, the machine could only be used for a small part of any day. Sometimes with a strong breeze up the river, the tide would not recede sufficiently to permit the horse to get in at all (and it did not appear advisable to incur the expense of 50*l.* to build a sideway entrance for the animal), so that under these circumstances we were obliged to discontinue the use of the horse and plough; which, under other circumstances, would have been very effective." From this time, I understand, the sewers of London have remained unploughed by means of horse labour.

But the plough was not altogether abandoned, and as horse-power was not found very easily applicable, water-power was resorted to. The plough and harrow were attached to a barge, which was introduced into the sewer. The sluice gates were kept shut until the ebb of the tide made the difference of level between the contents of the sewer and the surface of the Thames equal to some eight feet. "The gates were then suddenly opened, and the rapid and deep current of water following, was then sufficient to bring the barge and plough down the sewer with a force equal to five or six horse-power."

This last-mentioned method was also soon abandoned. We now come to the more approved plan of "flushing."

"The term '*flushing* sewers' implies," says Mr. Haywood, in his Report, "cleansing by the application of *bodies* of water in the sewers; this is periodically effected, varying in intervals according to the necessities of the sewerage or other circumstances."

The flushing system has a two-fold object, viz., to remove old deposits and prevent the accumulation of new. When the deposit is not allowed to accumulate and harden, "flushing consists," says Mr. Haywood, "simply in heading back and letting off *flush at once*" (hence the origin of the term) "that which has been delivered into the sewers in a certain number of hours by the various houses draining into them, diluted with large quantities of water specially employed for the purpose."

Though the operation of "flushing" is one of modern introduction, as regards the metropolis—one, indeed, which may be said to have originated in the modern demand for improved sanitary regulations—it has been practised in some country parts since the days of Henry VIII.

Flushing was practised also by those able engineers, the ancient Romans. One of the grand architectural remains of that people, the best showing their system of flushing, is in the Amphitheatre at Nismes, in France. The site of the ruined amphitheatre presents a large elliptical area, 114,251 superficial feet comprising its extent. Around the arena ran a large sewer 3 feet 6 inches in width, and 4 feet 9 inches in height. With this sewer, elliptical in shape, 348 pipes communicated, carrying into it the rain-fall and the refuse caused by the resort of 23,000 persons, for the seats alone contained that number. "The system of flushing, practised here," says Mr. Cresy, "with such advantage, deserves to be noticed, there being means of driving through this elliptical sewer a volume of water at pleasure, with such force that no solid matter could by any possibility remain within any of the drains or sewers. An aqueduct, 2 feet 8 inches in width, and 6 feet in height, brought this water from the reservoirs of Nismes, not only to fill but to purge

the whole of these sewers; after traversing the arena, it deviated a little to the south-west, where it was carried out at the sixth arcade, east of the southern entrance. Man-holes and steps to descend into this capacious vaulted aqueduct were introduced in several places; and there can be no doubt that by directing for some hours such a stream of water through it, the greatest cleanliness was preserved throughout all the sewers of the building."

The flushing of sewers appears to have been introduced into the metropolis by Mr. John Roe in the year 1847, but did not come into general use till some years later. There used to be a partial flushing of the London sewers twelve years ago. The mode of flushing as at present practised is as follows:—

In the first instance the inspector examines and reports the condition of the sewer, and receives and issues his orders accordingly. When the sewer is ordered to be flushed—and there is no periodical or regular observance of time in the operation—the men enter the sewers and rake up the deposit, loosening it everywhere, so as to render the whole easy to be swept along by the power of the volume of water. The sewers generally are, in their widest part, provided with grooves, or, as the men style them, "framings." Into these framings are fitted, or permanently attached, what I heard described as "penstocks," but which are spoken of in some of the reports as "traps," "gates," or "sluice gates." They are made both of wood and iron. By a series of bolts and adjustments, the penstocks can be fixed ready for use when the tide is highest in the sewer, and the volume of water the greatest. They then, of course, are in the nature of dams, the water having accumulated in consequence of the stoppage. The deposit having been loosened, the bolts are withdrawn, when the gates suddenly fly back, and the accumulated water and stirred-up sewage sweeps along impetuously, while the men retreat into some side recesses adapted for the purpose. The same is done with each penstock until the matter is swept through the outlet. The men always follow the course of this sewage-current when the sewer is of sufficient capacity to enable them to do so, throwing or pushing forward any more solid matter with their shovels.

"To flush we generally go and draw a slide up and let a flush of water down," said one man to me, "and then we have iron rakers to loosen the stuff. We have got another way that we do it as well; one man stands here, when the flush of water 's coming down, with a large board; then he lets the water rise to the top of this board, and then there's two or three of us on ahead, with shovels, loosening the stuff—then he ups with this board and lets a good heavy flush of water come down. Precious hard work it is, I can assure you. I've had many a wet shirt. We stand up to our fork in the water, right to the top of our jack-boots, and sometimes over them." "Ah, I should think you often get over the top of yours, for you come home with your stockings wet enough, goodness knows," exclaimed his wife, who was present. "When there 's a good flush of water coming down," he resumed, "we 're obligated to put our heads fast up against the crown of the sewer, and bear upon our shovels, so that we may not be carried away, and taken bang into the Thames. You see there's nothing for us to lay hold on. Why, there was one chap went and lifted a slide right up, when he ought to have had it up only 9 or 10 inches at the furthest, and he nearly swamped three of us. If we should be taken off our legs there's a heavy fall—about 3 feet—just before you comes to the mouth of the sewer, and if we was to get there, the water is so rapid nothing could save us. When we goes to work we nails our lanterns up to the crown of the sewer. When the slide is lifted up the rush is very great, and takes all before it. It roars away like a wild beast. We 're always obliged to work according to tide, both above and below ground. When we have got no water in the sewer we shovels the dirt up into a bank on both sides, so that when the flush of water comes down the loosened dirt is all carried away by it. After flushing, the bottom of the sewer is as clean as this floor, but in a couple of months the soil is a foot to 15 inches deep, and middling hard."

"Flushing-gates," an engineer has reported, "are chiefly of use in sewers badly constructed and without falls, but containing plenty of water; and they are of very little use where the gate has to be shut 24 hours and longer, before a head of water has accumulated; but where intermittent flushing is practised, strong smells are often caused *solely* by the stagnation of the water or sewage while accumulating behind the gate."

The most general mode of flushing at present adopted is not to keep in the water, &c., which has flowed into the sewer from the streets and houses, as well as the tide of the river, but to convey the flushing water from the plugs of the water companies into the kennels, and so into the sewers. I find in one of the Reports acknowledgments of the liberal supplies granted for flushing by the several companies. The water of the Surrey Canal has been placed, for the same object, at the disposal of the Sewer Commissioners.

It is impossible to "flush" at all where a sewer has a "dead-end;" that is, where there is a "block," as in the case of the Kenilworth-street sewer, Pimlico, in which five persons lost their lives in 1848.

There is no difference in the system of flushing in the Metropolitan and City jurisdictions, except that for the greater facilities of the process, the City provides water-tanks in Newgate-market, where the heads of three sewers meet, and where the accumulation of animal garbage, and the fierceness and numbers of the rats attracted thereby, were at one time frightful; at Leadenhall-market, and elsewhere, such tanks were also provided to the number of ten, the largest being the Newgate-market tank, which is a brick cistern of 8000 gallons capacity. Of these tanks, however, only four are now kept filled, for this collection of water is found unnecessary, the regular

Original from HARVARD UNIVERSITY

system of flushing answering the purpose without them; and I understand that in a little time there will be no tanks at all. The tank is filled, when required, by a water company, and the penstocks being opened, the water rushes into the sewers with great force. There is also another point peculiar to the City—in it all the sewers are flushed regularly twice a week; in the metropolitan sewers, only when the inspector pronounces flushing to be required. The City plan appears the best to prevent the accumulation of deposit.

There still remains to be described the system of "*plonging*," or mode of cleansing the open sewers, as contradistinguished from "*flushing*," or the cleansing of the covered sewers.

"When we go plonging," one man said, "we has long poles with a piece of wood at the end of them, and we stirs up the mud at the bottom of the ditches while the tide's a going down. We has got slides at the end of the ditches, and we pulls these up and lets out the water, mud, and all, into the Thames." "Yes, for the people to drink," said a companion drily. "We're in the water a great deal," continued the man. "We can't walk along the sides of all of 'em."

The difference of cost between the old method of removal and the new, that is to say, between carting and flushing, is very extraordinary.

This cartage work was done chiefly by contract and according to a Report of the surveyors to the Commissioners (Aug. 31, 1848), the usual cost for such work (almost always done during the night) was 7*s.* the cubic yard; that is, 7*s.* for the removal of a cubic yard of sewage by manual labour and horse and cart. In February, 1849 (the date of another Report on the subject), the cost of removing a cubic yard by the operation of flushing, was but 8*d.* This gives the following result, but in what particular time, instance, or locality, is not mentioned:—

79,483 cubic yards of deposit removed by the contract flushing system, at 8*d.* per cubic yard	£2,649
Same quantity by the old system of casting and cartage, 7*s.* per cubic yard .	27,819
Difference . . .	£25,170

"It appears, therefore," says Mr. Lovick, "that by the adoption of the contract flushing system, a saving has been effected within the comparatively short period of its operation over the filthy and clumsy system formerly practised, of 25,170*l.*, showing the cost of this system to be ten and a half times greater than the cost of flushing by contract."

An official Report states: "When the accumulations of years had to be removed from the sewers, the rate of cost per lineal mile has varied from about 40*l.* to 58*l.*, or from 6*d.* to 8*d.* per lineal yard. The works in these cases (excepting those in the City) have not exceeded nine lineal miles."

"On an average of weeks," says Mr. Lovick, in his Report on flushing operations, a few months after the introduction of the contract system, in Sept., 1848, "under present arrangements, about 62 miles of sewers are passed through each week, and deposit prevented from accumulating in them by periodic (weekly) flushing. The average cost per lineal mile per week is about 2*l.* 10*s.*

"The nature of the agreements with the contractors or gangers are now for the prevention of accumulations of deposit in a district. For this purpose the large districts are subdivided, each subdivision being let to one man. In the Westminster district there are four, in the Holborn and Finsbury two, in the Surrey and Kent, seven subdivisions.

"The Tower Hamlets and Poplar districts are each let to one man.

"In the Tower Hamlets it will be perceived that a reduction of 8*l.* has been effected for the performance of precisely the same work as that heretofore performed; the rates of charge standing thus:—

"Under the day-work system 23*l.* per week.
" contract " 15*l.* "

"In those portions specially contracted for, the work has been let by the lineal measure of the sewer, in preference to the amount of deposit removed.

"In the Surrey and Kent districts the open ditches have been cleansed thrice as often as formerly.

"A large proportion of the deposit removed is from the open ditches; in these the accumulations are rapid and continuous, caused chiefly by their being the receptacles for the ashes and refuse of the houses, the refuse of manufactories, and the sweepings of the roads.

"In the covered sewers one of the chief sources of accumulation is the detritus and mud from the streets, swept into the sewers.

"The accumulations from these sources will not, I think, be over-estimated at two-thirds of the whole amount of deposit removed.

"The contracts in operation, February, 1849, with the districts which they embrace, are as follows:—

"TABLE No. I.

Districts.	Sewers let for Prevention of Accumulations of Deposit.	Average Rate of Work performed in Sewers passed through each Week.	Contract Charge per Week.		
	Lineal Feet.	Lineal Feet.	£	*s.*	*d.*
Westminster	485,795	150,615	40	0	0
Holborn & Finsbury	355,085	118,000	23	0	0

Hence there would appear to have been a saving of 25*l.* 12*s.* effected. But by what means was this brought about? It is the old story, I regret to say—a reduction of the wages of the labouring men. But this, indeed, is the invariable effect of the contract system. The wages of the flushermen previous to Sept., 1848, were 24*s.* to 27*s.* a week; under the present system they are 21*s.* to 22*s.* Here is a reduction of 4*s.* per week per man, at the least; and as there were about 150 hands employed at this period, it follows that the gross weekly saving must have been equal to 30*l.*, so that, according to the above account, there would have been about 5*l.* left for the contractors or middlemen. It is unworthy of *gentlemen* to make a parade of economy obtained by such ignoble means.

The engineers, however, speak of flushing as what is popularly understood as but "a make-shift"—as a system imperfect in itself, but advantageously resorted to because obviating the evils of a worse system still.

"With respect to these operations," says Mr. Lovick, in a Report on the subject, in February, 1849, "I may be permitted to state that, although I do not approve of the flushing as an ultimate system, or as a system to be adopted in the future permanent works of sewerage, or that its use should be contemplated with regulated sizes of sewers, regulated supplies of water, and proper falls, it appears to be the most efficacious and economical for the purpose to which it is adapted of any yet introduced."

A gentleman who was at one time connected professionally with the management of the public sewerage, said to me,—

"Mr. John Roe commenced the general system of flushing sewers in London in 1847. It is, however, but a clumsy expedient, and quite incompatible with a perfect system of sewerage. It has, nevertheless, been usefully applied as an auxiliary to the existing system, though the cost is frightful."

OF THE WORKING FLUSHERMEN.

WHEN the system of sewer cleansing first became general, as I have detailed, the number of flushermen employed, I am assured, on good authority, was about 500. The sewers were, when this process was first resorted to, full of deposit, often what might be called "coagulated" deposit, which could not be affected except by constantly repeated efforts. There are now only about 100 flushermen, for the more regularly flushing is repeated, the easier becomes the operation.

Until about 18 months ago, the flushermen were employed directly by the Court of Sewers, and were paid ("in Mr. Roe's time," one man said, with a sigh) from 24*s.* to 27*s.* a week; now the work is *all done by contract.* There are some six or seven contractors, all builders, who undertake or are responsible for the whole work of flushing in the metropolitan districts (I do not speak of the City), and they pay the working flushermen 21*s.* a week, and the gangers 22*s.* This wage is always paid in money, without drawbacks, and without the intervention of any other middleman than the contractor middleman. The flushermen have no perquisites except what they may chance to find in a sewer. Their time of labour is 6½ hours daily.

The state of the tide, however, sometimes, as a matter of course, compels the flushermen to work at every hour of the day and night. At all times they carry lights, common oil lamps, with cotton wicks; only the inspectors carry Davy's safety-lamp. I met no man who could assign any reason for this distinction, except that "the Davy" gave "such a bad light."

The flushermen wear, when at work, strong blue overcoats, waterproofed (but not so much as used to be the case, the men then complaining of the perspiration induced by them), buttoned close over the chest, and descending almost to the knees, where it is met by huge leather boots, covering a part of the thigh, such as are worn by the fishermen on many of our coasts. Their hats are fan-tailed, like the dustmen's. The flushermen are well-conducted men generally, and, for the most part, fine stalwart good-looking specimens of the English labourer; were they not known or believed to be temperate, they would not be employed. They have, as a body, no benefit or sick clubs, but a third of them, I was told, or perhaps nearly a third, were members of general benefit societies. I found several intelligent men among them. They are engaged by the contractors, upon whom they call to solicit work.

"Since Mr. Roe's time," and Mr. Roe is evidently the popular man among the flushermen, or somewhat less than four years ago, the flushermen have had to provide their own dresses, and even their own shovels to stir up the deposit. To contractors, the comforts or health of the labouring men must necessarily be a secondary consideration to the realization of a profit. New men can always be found; safe investments cannot.

The wages of the flushermen therefore have been not only decreased, but their expenses increased. A pair of flushing-boots, covering a part of the thigh, similar to those worn by sea-side fishermen, costs 30*s.* as a low price, and a flusherman wears out three pairs in two years. Boot stockings cost 2*s.* 6*d.* The jacket worn by the men at their work in the sewers, in the shape of a pilot-jacket, but fitting less loosely, is 7*s.* 6*d.*; a blue smock, of coarse common cloth (generally), worn over the dress, costs 2*s.* 6*d.*; a shovel is 2*s.* 6*d.* "Ay, sir," said one man, who was greatly dissatisfied with this change, "they'll make soldiers find their own regimentals next; and, may be, their own guns, a'cause they can always get rucks of men for soldiers or labourers. I know there's plenty

would work for less than we get, but what of that? There always is. There 's hundreds would do the work for half what the surveyors and inspectors gets; but it 's all right among the nobs."

Nor is the labour of the flushermen at all times so easy or of such circumscribed hours as I have stated it to be in the regular way of flushing. When small branch-sewers have to be flushed, the deposit must first be loosened, or the water, instead of sweeping it away, would flow over it, and in many of these sewers (most frequent in the Tower Hamlets) the height is not more than 3 feet. Some of the flushermen are tall, bulky, strong fellows, and cannot stand upright in less than from 5 feet 8 inches to 6 feet, and in loosening the deposit in low narrow sewers, "we go to work," said one of them, "on our bellies, like frogs, with a rake between our legs. I 've been blinded by steam in such sewers near Whitechapel Church from the brewhouses; I couldn't see for steam; it was a regular London fog. You must get out again into a main sewer on your belly; that's what makes it harder about the togs, they get worn so."

The division of labour among the flushermen appears to be as follows:—

The *Inspector*, whose duty it is to go round the several sewers and see which require to be flushed.

The *Ganger*, or head of the working gang, who receives his orders from the inspector, and directs the men accordingly.

The *Lock-keeper*, or man who goes round to the sewers which are about to be flushed, and fixes the "penstocks" for retaining the water.

The *Gang*, which consists of from three to four men, who loosen the deposit from the bottom of the sewer. Among these there is generally a "for'ard man," whose duty it is to remove the penstocks.

The ganger gets 1*s.* a week over and above the wages of the men.

TABLE SHOWING THE DISTRICTS UNDER THE MANAGEMENT OF THE COMMISSIONERS OF SEWERS; ALSO THE NUMBER AND SALARIES OF THE CLERKS OF THE WORKS, ASSISTANT CLERKS OF THE WORKS, AND INSPECTORS OF FLUSHING, PAID BY THE COMMISSIONERS, AND THE NUMBER AND WAGES PAID TO THE FLUSHERMEN BY THE GENERAL CONTRACTORS.

Total cost of flushing the sewers . . . . . . £12,000 per annum.

* These officers are paid only during the period of service, and are chiefly engaged on special works.

The corresponding officers for London are under the City Commissioners.

*** The above division of districts is the one adopted by the Commissioners of Sewers, but the districts of the Flushermen are more numerous than those above given, being as follows:—

District		Ganger.		Flushermen.	
Fulham and Hammersmith	employing	1	and	6	1st District of Commissioners.
Counter's Creek and Ranelagh Districts	,,	1	,,	7	1st District of Commissioners.
Westminster (Western Division)	,,	1	,,	10	2nd District of Commissioners.
Ditto (Eastern Division)	,,	1	,,	12	2nd District of Commissioners.
Holborn Division	,,	1	,,	8	2nd District of Commissioners.
Finsbury Division	,,	1	,,	9	3rd District of Commissioners.
Tower Hamlets Levels	,,	1	,,	10	3rd District of Commissioners.
Poplar and Blackwall	,,	1	,,	8	3rd District of Commissioners.
Districts south of the Thames	,,	2	,,	22	4th District of Commissioners.
City	,,	1	,,	9	

Holborn and Finsbury districts are under one contractor, and so are the two divisions of Westminster. The same men who flush Holborn flush the Finsbury district also, 17 being the average number employed; but the Finsbury district requires rather more men than the Holborn; and the same men who work on the western division of Westminster flush also the eastern, the number of flushers in the western district being more, on account of its being the larger division.

The inspector receives 80*l.* per annum.

The table on p. 429 shows the number of clerks of the works, inspectors of flushing, flap and sluice keepers, gangers, and flushermen employed in the several districts throughout the metropolis, as well as the salaries and wages of each and the whole.

None of the flushermen can be said to have been "brought up to the business," for boys are never employed in the sewers. Neither had the labourers been confined in their youth to any branch of trade in particular, which would appear to be consonant to such employment. There are now among the flushermen men who have been accustomed to "all sorts of ground work:" tailors, pot-boys, painters, one jeweller (some time ago there was also one gentleman), and shoemakers. "You see, sir," said one informant, "many of such like mechanics can't live above ground, so they tries to get their bread underneath it. There used to be a great many pensioners flushermen, which weren't right," said one man, "when so many honest working men haven't a penny, and don't know which way to turn theirselves; but pensioners have often good friends and good interest. I don't hear any complaints that way now."

Among the flushermen are some ten or twelve men who have been engaged in sewer-work of one kind or another between 20 and 30 years. The cholera, I heard from several quarters, did not (in 1848) attack any of the flushermen. The answer to an inquiry on the subject generally was, "Not one that I know of."

"It is a somewhat singular circumstance," says Mr. Haywood, the City Surveyor, in his Report, dated February, 1850, "*that none of the men employed in the City sewers in flushing and cleansing, have been attacked with, or have died of, cholera during the past year; this was also the case in* 1832–3. I do not state this to prove that the atmosphere of the sewers is not unhealthy—I by no means believe an impure atmosphere is healthy—but I state the naked fact, as it appears to me a somewhat singular circumstance, and leave it to pathologists to argue upon."

"I don't think flushing work disagrees with my husband," said a flusherman's wife to me, "for he eats about as much again at that work as he did at the other." "The smell underground is sometimes very bad," said the man, "but then we generally take a drop of rum first, and something to eat. It wouldn't do to go into it on an empty stomach, 'cause it would get into our inside. But in some sewers there 's scarcely any smell at all. *Most of the men are healthy who are engaged in it; and when the cholera was about many used to ask us how it was we escaped.*"

The following statement contains the history of an individual flusherman:—

"I was brought up to the sea," he said, "and served on board a man-of-war, the *Racer*, a 16-gun brig, laying off Cuba, in the West Indies, and thereaway, watching the slavers. I served seven years. We were paid off in '43 at Portsmouth, and a friend got me into the *shores*. It was a great change from the open sea to a close *shore*—great; and I didn't like it at all at first. But it suits a married man, as I am now, with a family, much better than being a seaman, for a man aboard a ship can hardly do his children justice in their schooling and such like. Well, I didn't much admire going down the man-hole at first—the 'man-hole' is a sort of iron trap-door that you unlock and pull up; it leads to a lot of steps, and so you get into the *shore*—but one soon gets accustomed to anything. I 've been at flushing and *shore* work now since '43, all but eleven weeks, which was before I got engaged.

"We work in gangs from three to five men." [Here I had an account of the process of flushing, such as I have given.] "I 've been carried off my feet sometimes in the flush of a *shore*. Why, to-day," (a very rainy and windy day, Feb. 4,) "it came down Baker-street, when we flushed it, 4 foot plomb. It would have done for a mill-dam. One couldn't smoke or do anything. Oh, yes, we can have a pipe and a chat now and then in the *shore*. The tobacco checks the smell. No, I can't say I felt the smell very bad when I first was in a *shore*. I 've felt it worse since. I 've been made innocent drunk like in a *shore* by a drain from a distiller's. That happened me first in Vine-street *shore*, St. Giles's, from Mr. Rickett's distillery. It came into the *shore* like steam. No, I can't say it tasted like gin when you breathed it—only intoxicating like. It was the same in Whitechapel from Smith's distillery. One night I was forced to leave off there, the steam had such an effect. I was falling on my back, when a mate caught me. The breweries have something of the same effect, but nothing like so strong as the distilleries. It comes into the *shore* from the brewers' places in steam. I 've known such a steam followed by bushels of grains; ay, sir, cart-loads washed into the *shore*.

"Well, I never found anything in a *shore* worth picking up but once a half-crown. That was in the Buckingham Palace sewer. Another time I found 16*s.* 6*d.*, and thought that *was* a haul; but every bit of it, every coin, shillings and sixpences and joeys, was bad—all smashers. Yes, of course it was a disappointment, naturally so. That happened in Brick-lane *shore*, Whitechapel. O, somebody or other had got frightened, I suppose, and had shied the coins down into the drains. I found them just by the chapel there."

A second man gave me the following account of his experience in flushing:—

"You remember, sir, that great storm on the 1st August, 1848. I was in three *shores* that fell in —Conduit-street and Foubert's-passage, Regent-street. There was then a risk of being drowned in the *shores*, but no lives were lost. All the house-drains were blocked about Carnaby-market —that 's the Foubert's-passage *shore*—and the poor people was what you might call houseless. We got in up to the neck in water in some places, 'cause we had to stoop, and knocked about the rubbish as well as we could, to give a way to the water. The police put up barriers to prevent any carts or carriages going that way along the streets. No, there was no lives lost in the *shores*. One

man was so overcome that he was falling off into a sort of sleep in Milford-lane *shore*, but was pulled out. I helped to pull him. He was as heavy as lead with one thing or other—wet, and all that. Another time, six or seven year ago, Whitechapel High-street *shore* was almost choked with butchers' offal, and we had a great deal of trouble with it."

Of the Rats in the Sewers.

I will now state what I have learned from long-experienced men, as to the characteristics of the rats in the sewers. To arrive even at a conjecture as to the numbers of these creatures—now, as it were, the population of the sewers—I found impossible, for no statistical observations have been made on the subject; but all my informants agreed that the number of the animals had been greatly diminished within these four or five years.

In the better-constructed sewers there are no rats. In the old sewers they abound. The sewer rat is the ordinary house or brown rat, excepting at the outlets near the river, and here the water-rat is seen.

The sewer-rat is the common brown or Hanoverian rat, said by the Jacobites to have come in with the first George, and established itself after the fashion of his royal family; and undoubtedly such was about the era of their appearance. One man, who had worked twelve years in the sewers before flushing was general, told me he had never seen but *two* black (or old English) rats; another man, of ten years' experience, had seen but one; others had noted no difference in the rats. I may observe that in my inquiries as to the sale of rats (as a part of the live animals dealt in by a class in the metropolis), I ascertained that in the older granaries, where there were series of floors, there were black as well as brown rats. "Great black fellows," said one man who managed a Bermondsey granary, "as would frighten a lady into asterisks to see of a sudden."

The rat is the only animal found in the sewers. I met with no flusherman or other sewer-worker who had ever seen a lizard, toad, or frog there, although the existence of these creatures, in such circumstances, has been presumed. A few live cats find their way into the subterranean channels when a house-drain is being built, or is opened for repairs, or for any purpose, and have been seen by the flushermen, &c., wandering about, looking lost, mewing as if in misery, and avoiding any contact with the sewage. The rats also—for they are not of the water-rat breed—are exceedingly averse to wetting their feet, and "take to the sewage," as it was worded to me, only in prospect of danger; that is, they then swim across or along the current to escape with their lives. It is said that when a luckless cat has ventured into the sewers, she is sometimes literally worried by the rats. I could not hear of such an attack having been witnessed by any one; but one intelligent and trustworthy man said, that a few years back (he believed about eight years) he had in one week found the skeletons of two cats in a particular part of an old sewer, 21 feet wide, and in the drains opening into it were perfect colonies of rats, raging with hunger, he had no doubt, because a system of trapping, newly resorted to, had prevented their usual ingress into the houses up the drains. A portion of their fur adhered to the two cats, but the flesh had been eaten from their bones. About that time a troop of rats flew at the feet of another of my informants, and would no doubt have maimed him seriously, "but my boots," said he, "stopped the devils." "The sewers generally swarms with rats," said another man. "I runs away from 'em; I don't like 'em. They in general gets away from us; but in case we comes to a stunt end where there 's a wall and no place for 'em to get away, and we goes to touch 'em, they fly at us. They 're some of 'em as big as good-sized kittens. One of our men caught hold of one the other day by the tail, and he found it trying to release itself, and the tail slipping through his fingers; so he put up his left hand to stop it, and the rat caught hold of his finger, and the man 's got an arm now as big as his thigh." I heard from several that there had been occasionally battles among the rats, one with another.

"Why, sir," said one flusherman, "as to the number of rats, it ain't possible to say. There hasn't been a census (laughing) taken of them. But I can tell you this—I was one of the first flushermen when flushing came in general—I think it was before Christmas, 1847, under Mr. Roe—and there was cart-loads and cart-loads of drowned rats carried into the Thames. It was in a West Strand *shore* that I saw the most. I don't exactly remember which, but I think Northumberland-street. By a block or a hitch of some sort, there was, I should say, just a bushel of drowned rats stopped at the corner of one of the gates, which I swept into the next stream. I see far fewer drowned rats now than before the *shores* was flushed. They 're not so plenty, that 's one thing. Perhaps, too, they may have got to understand about flushing, they 're that 'cute, and manage to keep out of the way. About Newgate-market was at one time the worst for rats. Men couldn't venture into the sewers then, on account of the varmint. It 's bad enough still, I hear, but I haven't worked in the City for a few years."

The rats, from the best information at my command, do not derive much of their sustenance from the matter in the sewers, or only in particular localities. These localities are the sewers neighbouring a connected series of slaughter-houses, as in Newgate-market, Whitechapel, Clare-market, parts adjoining Smithfield-market, &c. There, animal offal being (and having been to a much greater extent five or six years ago) swept into the drains and sewers, the rats find their food. In the sewers, generally, there is little food for them, and none at all in the best-constructed sewers, where there is a regular and sometimes rapid flow, and little or no deposit.

The sewers are these animals' breeding grounds. In them the broods are usually safe from the molestation of men, dogs, or cats. These "breeding grounds" are sometimes in the holes (excavated by

the industry of the rats into caves) which have been formed in the old sewers by a crumbled brick having fallen out. Their nests, however, are in some parts even more frequent in places where old rotting large house-drains or smaller sewers, empty themselves into a first-class sewer. Here, then, the rats breed, and, in spite of precautions, find their way up the drains or pipes, even through the openings into water-closets, into the houses for their food, and almost always at night. Of this fact, builders, and those best informed, are confident, and it is proved indirectly by what I have stated as to the deficiency of food for a voracious creature in all the sewers except a few. One man, long in the service of the Commissioners of Sewers, and in different capacities, gave me the following account of what may be called a rat settlement. The statement I found confirmed by other working men, and by superior officers under the same employment.

"Why, sir, in the Milford-lane sewer, a goodish bit before you get to the river, or to the Strand—I can't say how far, a few hundred yards perhaps—I've seen, and reported, what was a regular chamber of rats. If a brick didn't fall out from being rotted, the rats would get it out, and send it among other rubbish into the sewer, for this place was just the corner of a big drain. I couldn't get into the rat-hole, of course not, but I've brought my lamp to the opening, and—as well as others—have seen it plain. It was an open place like a lot of tunnels, one over another. Like a lot of rabbit burrows in the country—as I've known to be—or like the partitions in the pigeon-houses: one here and another there. The rat-holes, as far as I could tell, were worked one after another. I should say, in moderation, that it was the size of a small room; well, say about 6 yards by 4. I can't say about the height from the lowest tunnel to the highest. I don't see that any one could. Bless you, sir, I've sometimes heerd the rats fighting and squeaking there, like a parcel of drunken Irishmen—I have indeed. Some of them were rare big fellows. If you threw the light of your lamp on them sudden, they'd be off like a shot. Well, I should say, there was 100 pair of rats there—there might be more, besides all their young-uns. If a poor cat strayed into that sewer, she durstn't tackle the rats, not she. There's lots of such places, sir, here, and there, and everywhere."

"I believe rats," says a late enthusiastic writer on the subject, under the cognomen of Uncle James, "to be one of the most fertile causes of national and universal distress, and their attendants, misery and starvation."

From the author's inquiries among practical men, and from his own study of the natural history of the rat, he shows that these animals will have six, seven, or eight nests of young in the year, for three or four years together; that they have from twelve to twenty-three at a litter, and breed at three months old; and that there are more female than male rats, by ten to six.

The author seems somewhat of an enthusiast about rats, and as the sewerage is often the head-quarters of these animals—their "breeding-ground" indeed—I extract the following curious matter. He says:—

"Now, I propose to lay down my calculations at something less than one-half. In the first place, I say four litters in the year, beginning and ending with a litter, so making thirteen litters in three years; secondly to have eight young ones at a birth, half male and half female; thirdly, the young ones to have a litter at six months old.

"At this calculation, I will take one pair of rats; and at the expiration of three years what do you suppose will be the amount of living rats? Why no less a number than 646,808.

"Mr. Shaw's little dog 'Tiny,' under six pounds weight, has destroyed 2525 pairs of rats, which, had they been permitted to live, would, at the same calculation and in the same time, have produced 1,633,190,200 living rats!

"And the rats destroyed by Messrs. Shaw and Sabin in one year, amounting to 17,000 pairs, would, had they been permitted to live, have produced, at the above calculation and in the same time, no less a number than 10,995,736,000 living rats!

"Now, let us calculate the amount of human food that these rats would destroy. In the first place, my informants tell me that six rats will consume day by day as much food as a man; secondly, that the thing has been tested, and that the estimate given was, that eight rats would consume more than an ordinary man.

"Now, I—to place the thing beyond the smallest shadow of a doubt—will set down ten rats to eat as much as a man, not a child; nor will I say anything about what rats waste. And what shall we find to be the alarming result? Why, that the first pair of rats, with their three years' progeny, would consume in the night more food than 64,680 men the year round, and leaving eight rats to spare!"

The author then puts forth the following curious statement:—

"And now for the vermin destroyed by Messrs. Shaw and Sabin—34,000 yearly! Taken at the same calculation, with their three years' progeny—can you believe it?—they would consume more food than the whole population of the earth? Yes, if Omnipotence would raise up 29,573,600 more people, these rats would consume as much food as them all! You may wonder, but I will prove it to you:—The population of the earth, including men, women, and children, is estimated to be 970,000,000 souls; and the 17,000 rats in three years would produce 10,995,736,000: consequently, at ten rats per man, there would be sufficient rats to eat as much food as all the people on the earth, and leaving 1,295,736,000. So that if the human family were increased to 1,099,573,600, instead of 970,000,000, there would be rats enough to eat the food of them all! Now, sirs, is not this a most appalling thing, to think that there are at the present time in the British Empire thousands—nay, millions—of human beings in a state of utter starvation, while rats are con-

THOSE THAT WILL NOT WORK.

INTRODUCTION.

I ENTER upon this part of my subject with a deep sense of the misery, the vice, the ignorance, and the want that encompass us on every side—I enter upon it after much grave attention to the subject, observing closely, reflecting patiently, and generalizing cautiously upon the phenomena and causes of the vice and crime of this city—I enter upon it after a thoughtful study of the habits and character of the "outcast" class generally—I enter upon it, moreover, not only as forming an integral and most important part of the task I have imposed upon myself, but from a wish to divest the public mind of certain "idols" of the platform and conventicle—"idols" peculiar to our own time, and unknown to the great Father of the inductive philosophy—and "idols," too, that appear to me greatly to obstruct a proper understanding of the subject. Further, I am led to believe that I can contribute some new facts concerning the physics and economy of vice and crime generally, that will not only make the solution of the social problem more easy to us, but, setting more plainly before us some of its latent causes, make us look with more pity and less anger on those who want the fortitude to resist their influence; and induce us, or at least the more earnest among us, to apply ourselves steadfastly to the removal or alleviation of those social evils that appear to create so large a proportion of the vice and crime that we seek by punishment to prevent.

Such are the *ultimate* objects of my present labours: the result of them is given to the world with an earnest desire to better the condition of the wretched social outcasts of whom I have now to treat, and to contribute, if possible, my mite of good towards the common weal.

But though such be my ultimate object, let me here confess that my immediate aim is the elimination of the truth; without this, of course, all other principles must be sheer sentimentality—sentiments being, to my mind, opinions engendered by the feelings rather than the judgment. The attainment of the truth, then, will be my primary aim; but by the truth, I wish it to be understood, I mean something *more* than the bare facts. Facts, according to my ideas, are merely the elements of truths, and not the truths themselves; of all matters there are none so utterly useless by themselves as your mere matters of fact. A fact, so long as it remains an isolated fact, is a dull, dead, uninformed thing; no object nor event by itself can possibly give us any knowledge, we must compare it with some other, even to distinguish it; and it is the distinctive quality thus developed that constitutes the essence of a thing—that is to say, the point by which we cognize and recognise it when again presented to us. A fact must be assimilated with, or discriminated from, some other fact or facts, in order to be raised to the dignity of a truth, and made to convey the least knowledge to the mind. To say, for instance, that in the year 1850 there were 26,813 criminal offenders in England and Wales, is merely to oppress the brain with the record of a fact that, *per se*, is so much mental lumber. This is the very mummery of statistics; of what rational good can such information by itself be to any person? who can tell whether the number of offenders in that year be large or

(5)

small, unless they compare it with the number of some other year, or in some other country? but to do this will require another fact, and even then this second fact can give us but little real knowledge. It may teach us, perhaps, that the past year was more or less criminal than some other year, or that the people of this country, in that year, were more or less disposed to the infraction of the laws than some other people abroad; still, what will all this avail us? If the year which we select to contrast criminally with that of 1850 be not itself compared with other years, how are we to know whether the number of criminals appertaining to it be above or below the average? or, in other words, how can the one be made a measure of the other?

To give the least mental value to facts, therefore, we must generalize them, that is to say, we must contemplate them in connection with other facts, and so discover their agreements and differences, their antecedents, concomitants, and consequences. It is true we may frame erroneous and defective theories in so doing; we may believe things which are similar in appearance to be similar in their powers and properties also; we may distinguish between things having no real difference; we may mistake concomitant events for consequences; we may generalize with too few particulars, and hastily infer that to be common to all which is but the special attribute of a limited number; nevertheless, if theory may occasionally teach us wrongly, facts without theory or generalization cannot possibly teach us at all. What the process of digestion is to food, that of generalizing is to fact; for as it is by the assimilation of the substances we eat with the elements of our bodies that our limbs are enlarged and our whole frames strengthened, so is it by associating perception with perception in our brains that our intellect becomes at once expanded and invigorated. Contrary to the vulgar notion, theory, that is to say, theory in its true Baconian sense, is not opposed to fact, but consists rather of a *large* collection of facts; it is not true of this or that thing alone, but of *all* things belonging to the same class—in a word, it consists not of *one* fact but an *infinity*. The theory of gravitation, for instance, expresses not only what occurs when a stone falls to the earth, but when every other body does the same thing; it expresses, moreover, what takes place in the revolution of the moon round our planet, and in the revolution of our planet and of all the other planets round our sun, and of all other suns round the centre of the universe; in fine, it is true not of one thing merely, but of every material object in the entire range of creation.

There are, of course, two methods of dealing philosophically with every subject—deductively and inductively. We may either proceed from principles to facts, or recede from facts to principles. The one explains, the other investigates; the former applies known general rules to the comprehension of particular phenomena, and the latter classifies the particular phenomena, so that we may ultimately come to comprehend their unknown general rules. The deductive method is the mode of *using* knowledge, and the inductive method the mode of *acquiring* it.

In a subject like the crime and vice of the metropolis, and the country in general, of which so little is known — of which there are so many facts, but so little comprehension—it is evident that we must seek by induction, that is to say, by a careful classification of the known phenomena, to render the matter more intelligible; in fine, we must, in order to arrive at a *comprehensive* knowledge of its antecedents, consequences, and concomitants, contemplate as large a number of facts as possible in as many different relations as the statistical records of the country will admit of our doing.

With this brief preamble I will proceed to treat generally of the class that will not work, and then particularly of that portion of them termed prostitutes. But, first, who are those that *will* work, and who those that *will not* work? This is the primary point to be evolved.

Of the Workers and Non-Workers.

The essential quality of an animal is that it seeks its own living, whereas a vegetable has its living brought to it. An animal cannot stick its feet in the ground and suck up the inorganic elements of its body from the soil, nor drink in the organic elements from the atmosphere. The leaves of plants are not only their lungs but their stomachs. As *they* breathe they acquire food and strength, but as animals breathe *they* gradually waste away. The carbon which is *secreted* by the process of respiration in the vegetable is excreted by the very same process in the animal. Hence a fresh supply of *carbonaceous* matter must be sought after and obtained at frequent intervals, in order to repair the continual waste of animal life.

But in the act of seeking for substances fitted to replace that which is lost in respiration, nerves must be excited and muscles moved; and recent discoveries have shown that such excitation and motion are attended with decomposition of the organs in which they occur. Muscular action gives rise to the destruction of muscular tissue, nervous action to a change in the nervous matter; and this destruction and decomposition necessarily involve a fresh supply of *nitrogenous* matter, in order that the loss may be repaired.

Now a tree, being inactive, has little or no waste. All the food that it obtains goes to the invigoration of its frame; not one atom is destroyed in seeking more: but the essential condition of animal life is muscular action; the essential condition of muscular action is the destruction of muscular tissue; and the essential condition of the destruction of muscular tissue is a supply of food fitted for the reformation of it, or—*death*. It is impossible for an animal—like a vegetable—to stand still and not destroy. If the limbs are not moving, the heart is beating, the lungs playing, the bosom heaving. Hence an animal, in order to continue its existence, must obtain its subsistence either by its own exertions or by those of others—in a word, it must be *autobious* or *allobious*.

The procuration of sustenance, then, is the necessary condition of animal life, and constitutes the sole apparent reason for the addition of the locomotive apparatus to the vegetative functions of sentient nature; but the faculties of comparison and volition have been further added to the animal nature of Man, in order to enable him, among other things, the better to gratify his wants—to give him such a mastery over the elements of material nature, that he may force the external world the more readily to contribute to his support. Hence the derangement of either one of those functions must degrade the human being—as regards his means of sustenance—to the level of the brute. If his intellect be impaired, and the faculty of perceiving "the fitness of things" be consequently lost to him—or, this being sound, if the power of moving his muscles in compliance with his will be deficient—then the individual becomes no longer capable, like his fellows, of continuing his existence by his own exertions.

Hence, in every state, we have two extensive causes of allobiism, or living by the labour of others; the one intellectual, as in the case of lunatics and idiots, and the other physical, as in the case of the infirm, the crippled, and the maimed—the old and the young.

But a third, and a more extensive class, still remains to be particularized. The members of every community may be divided into the *energetic* and the *an-ergetic;* that is to say, into the hardworking and the non-working, the industrious and the indolent classes; the distinguishing characteristic of the *anergetic* being the extreme irksomeness of all labour to them, and their consequent indisposition to work for their subsistence. Now, in the circumstances above enumerated, we have three capital causes why, in every State, a certain portion of the community must derive their subsistence from the exertions of the rest; the first proceeds from some *physical* defect, as in the case of the old and the young, the super-annuated and the sub-annuated, the crippled and the maimed; the second from some *intellectual* defect, as in the case of lunatics and idiots; and the third from some *moral* defect, as in the case of the indolent, the vagrant, the professional mendicant, and the criminal. In all civilized countries, there will necessarily be a greater or less number of human parasites living on the sustenance of their fellows. The industrious must labour to support the lazy, and the sane to keep the insane, and the able-bodied to maintain the infirm.

Still, to complete the social fabric, another class requires to be specified. As yet, regard has been paid only to those who must needs labour for their living, or who, in default of so doing, must prey on the proceeds of the industry of their more active or more stalwart brethren. There is, however, in all civilized society, a farther portion of the people distinct from either of those above mentioned, who, being already provided—no matter how—with a sufficient stock of sustenance, or what will exchange for such, have no occasion to toil for an additional supply.

Hence all society would appear to arrange itself into four different classes:—

I. Those that Will Work.
II. Those that Cannot Work.
III. Those that Will Not Work.
IV. Those that Need Not Work.

Under one or other section of this quadruple division, every member, not only of our community, but of every other civilized State, must necessarily be included; the rich, the poor, the industrious, the idle, the honest, the dishonest, the virtuous, and the vicious—each and all must be comprised therein.

Let me now proceed specially to treat of each of these classes—to distribute under one or other of these four categories the diverse modes of living peculiar to the members of our own community, and so to enunciate, for the first time, the natural history, as it were, of the industry and idleness of Great Britain in the nineteenth century.

It is no easy matter, however, to classify the different kinds of labour scientifically. To arrange the several varieties of work into "orders," and to group the manifold species of arts under a few comprehensive genera—so that the mind may grasp the whole at one effort—is a task of a most perplexing character. Moreover, the first attempt to bring any number of diverse phenomena within the rules of logical division is not only a matter of considerable difficulty, but one, unfortunately, that is generally unsuccessful. It is impossible, however, to proceed with the present inquiry without making some attempt at systematic arrangement; for of all scientific processes, the classification of the various phenomena, in connection with a given subject, is perhaps the most important; indeed, if we consider that the function of cognition is essentially *discriminative*, it is evident, that without distinguishing between one object and another, there can be no knowledge, nor, indeed, any perception. Even as the seizing of a particular difference causes the mind to *apprehend* the special character of an object, so does the discovery of the agreements and differences among the several phenomena of a subject enable the understanding to *comprehend* it. What the generalization of events is to the ascertainment of natural laws, the generalization of things is to the discovery of natural systems. But classification is no less dangerous than it is important to science; for in precisely the same proportion as a correct grouping of objects into genera and species, orders and varieties, expands and assists our understanding, so does any erroneous arrangement cripple and retard all true knowledge. The reduction of all external substances into four elements by the ancients—earth, air, fire, and water—perhaps did more to obstruct the progress of chemical science than even a prohibition of the study could have effected.

But the branches of industry are so multifarious, the divisions of labour so minute and manifold, that it seems at first almost impossible to reduce them to any system. Moreover, the crude generalizations expressed in the names of the several arts, render the subject still more perplexing.

Some kinds of workmen, for example, are called after the *articles they make*—as saddlers, hatters, boot-makers, dress-makers, breeches-makers, stay-makers, lace-makers, button-makers, glovers, cabinet-makers, artificial-flower-makers, ship-builders, organ-builders, boat-builders, nailers, pin-makers, basket-makers, pump-makers, clock and watch makers, wheel-wrights, ship-wrights, and so forth.

Some operatives, on the other hand, take their names not from what they make, but from the *kind of work they perform*. Hence we have carvers, joiners, bricklayers, weavers, knitters, engravers, embroiderers, tanners, curriers, bleachers, thatchers, lime-burners, glass-blowers, seamstresses, assayers, refiners, embossers, chasers, painters, paper-hangers, printers, book-binders, cab-drivers, fishermen, graziers, and so on.

Other artizans, again, are styled after the *materials upon which they work*, such as tinmen, jewellers, lapidaries, goldsmiths, braziers, plumbers, pewterers, glaziers, &c. &c.

And lastly, a few operatives are named after the *tools they use*; thus we have ploughmen, sawyers, and needlewomen.

But these divisions, it is evident, are as unscientific as they are arbitrary; nor would it be possible, by adopting such a classification, to arrive at any practical result.

Now, I *had* hoped to have derived some little assistance in my attempt to reduce the several varieties of work to system from the arrangement of the products of industry and art at "the Great Exhibition." I knew, however, that the point of classification had proved the great stumbling block to the French Industrial Exhibitions. In the Exposition of the Arts and Manufactures of France in 1806, for instance, M. Costaz adopted a topographical arrangement, according to the departments of the kingdom whence the specimens were sent. In 1819, again, finding the previous arrangement conveyed little or no knowledge, depending, as it did, on the mere local association of the places of manufacture, the same philosopher attempted to classify all arts into a sort of natural system, but the separate divisions amounted to thirty-nine, and were found to be confused and inconvenient. In 1827 M. Payon adopted a classification into five great divisions, arranging the arts according as they are chemical, mechanical, physical, economical, or "miscellaneous" in their nature. It was found, however, in practice, that two, or even three, of these characteristics often belonged to the same manufacture. In

Original from HARVARD UNIVERSITY

1834 M. Dupin proposed a classification that was found to work better than any which preceded it. He viewed man as a locomotive animal, a clothed animal, a domiciled animal, &c., and thus tracing him through his various daily wants and employments, he arrived at a classification in which all arts are placed under nine headings, according as they contribute to the alimentary, sanitary, vestiary, domiciliary, locomotive, sensitive, intellectual, preparative, or social tendencies of man. In 1844 and 1849 attempts were made towards an eclectic combination of two or three of the above-mentioned systems, but it does not appear that the latter arrangements presented any marked advantages.

Now, with all the experience of the French nation to guide us, I naturally expected that especial attention would be directed towards the point of classification with us, and that a technological system would be propounded, which would be found at least an improvement on the bungling systems of the French. It must be confessed, however, that no nation could possibly have stultified itself so egregiously as we have done in this respect. Never was there anything half so puerile as the classification of the works of industry in our own Exhibition!

But this comes of the patronage of Princes; for we are told that at one of the earliest meetings at Buckingham Palace his Royal Highness *propounded* the system of classification according to which the works of industry *were to be* arranged. The published minutes of the meeting on the 30th of June, 1849, inform us—

"His Royal Highness communicated his views regarding the formation of a Great Collection of Works of Industry and Art in London in 1851, for the purposes of exhibition, and of competition and encouragement. His Royal Highness considered that such a collection and exhibition should consist of the following divisions:—

Raw Materials.
Machinery and Mechanical Inventions.
Manufactures.
Sculpture and Plastic Art generally."

Now, were it possible for monarchs to do with natural laws as with social ones, namely, to blow a trumpet and declaring "*le roi le veut*," to have their will pass into one of the statutes of creation, it might be advantageous to science that Princes should seek to lay down orders of arrangement and propound systems of classification. But seeing that Science is as pure a republic as Letters, and that there are no "Highnesses" in philosophy—for if there be any aristocracy at all in such matters, it is at least an aristocracy of intellect — it is rather an injury than a benefit that those who are high in authority should interfere in these affairs at all; since, from the very circumstances of their position it is utterly impossible for them to arrive at anything more than the merest surface knowledge on such subjects. The influence, too, that their mere "authority" has over men's minds is directly opposed to the perception of truth, preventing that free and independent exercise of the intellect from which alone all discovery and knowledge can proceed.

Judging the quadruple arrangement of the Great Exhibition by the laws of logical division, we find that the three classes—Raw Materials, Machinery, and Manufactures—which refer more particularly to the Works of Industry, are neither distinct nor do they include the whole. What is a raw material, and what a manufacture? It is from the difficulty of distinguishing between these two conditions that leather is placed under Manufactures, and steel under Raw Materials—though surely steel is iron *plus* carbon, and leather skin *plus* tannin; so that, technologically considered, there is no difference between them. If by the term raw material is meant some natural product in its crude state, then it is evident that "Geological maps, plans, and sections; prussiate of potash, and other mixed chemical manufactures; sulphuric, muriatic, nitric, and other acids; medicinal tinctures, cod liver oil, dried fruits, fermented liquors and spirits, preserved meats, portable soups, glue, and the alloys" cannot possibly rank as *raw* materials, though one and all of these articles are to be found so "classified" at the Great Exhibition; but if the meaning of a "raw material" be extended to any product which constitutes the substance to be operated upon in an industrial art, then the answer is that leather, which is the material of shoes and harness, is no more a manufacture than steel, which is placed among the raw materials, because forming the constituent substance of cutlery and tools. So interlinked are the various arts and manufactures, that what is the product of one process of industry is the material of another—thus, yarn is the product of spinning, and the material of weaving, and in the same manner the cloth, which is the product of weaving, becomes the material of tailoring.

But a still greater blunder than the non-distinction between products and materials lies in the confounding of *processes* with *products*. In an Industrial Exhibition to

reserve no special place for the processes of industry is very much like the play of Hamlet with the part of Hamlet omitted; and yet it is evident that, in the quadruple arrangement before mentioned, those most important industrial operations which consist merely in arriving at the same result by simpler means—as, for instance, the hot blast in metallurgical operations—can find no distinct expression. The consequence is that methods of work are arranged under the same head as the work itself; and the "Executive" have been obliged to group under the first subdivision of *Raw Materials* the following inconsistent jumble:—Salt deposits; ventilation; safety lamps and other methods of lighting; methods of lowering and raising miners, and draining; methods of roasting, smelting, or otherwise reducing ores; while under the second subdivision of Raw Materials chemical and pharmaceutical *processes* and *products* are indiscriminately confounded.

Another most important defect is the omission of all mention of those industrial processes which have *no special or distinct products of their own*, but which are rather engaged *in adding to the beauty or durability of others;* as, for instance, the bleaching of some textile fabrics, the embroidering of others, the dyeing and printing of others; the binding of books; the cutting of glass; the painting of china, &c. From the want of an express division for this large portion of our industrial arts, there is a jumbling and a bungling throughout the whole arrangement. Under the head of *manufactures* are grouped printing and bookbinding, the "dyeing of woollen, cotton, and linen goods," "embroidery, fancy, and industrial work," the cutting and engraving of glass; and, lastly, the art of "decoration generally," including "ornamental, coloured decoration," and the "imitations of woods, marbles, &c.,"—though surely these are one and all *additions* to manufactures rather than *manufactures* themselves. Indeed, a more extraordinary and unscientific hotch-potch than the entire arrangement has never been submitted to public criticism and public ridicule.

Amid all this confusion and perplexity, then, how are we to proceed? Why, we must direct our attention to some more judicious and more experienced guide. In such matters, at least, as the Exposition of the Science of Labour, it is clear that we must "put not our trust in princes."

That Prince Albert has conferred a great boon on the country in the establishment of the Great Exhibition (for it is due not only to his patronage but to his own personal exertions), no unprejudiced mind can for a moment doubt; and that he has, ever since his first coming among us, filled a most delicate office in the State in a highly decorous and commendable manner, avoiding all political partizanship, and being ever ready to give the influence of his patronage, and, indeed, co-operation, to anything that appeared to promise an amelioration of the condition of the working classes of this country, I am most glad to have it in my power to bear witness; but that, *because of this*, we should pin our faith to a "hasty generalization" propounded by him, would be to render ourselves at once silly and servile.

If, with the view of obtaining some more precise information concerning the several branches of industry, we turn our attention to the Government analysis of the different modes of employment among the people, we shall find that for all purposes of a scientific or definite character the Occupation Abstract of the Census of this country is comparatively useless. Previous to 1841, the sole attempt made at generalization was the division of the entire industrial community into three orders, viz.:—

I. *Those employed in Agriculture.*
  1. Agricultural Occupiers.
    a. Employing Labourers.
    b. Not employing Labourers.
  2. Agricultural Labourers.

II. *Those employed in Manufactures.*
  1. Employed in Manufactures.
  2. Employed in making Manufacturing Machinery.

III. *All other Classes.*
  1. Employed in Retail Trade or in Handicraft, as Masters or Workmen.
  2. Capitalists, Bankers, Professional, and other educated men.
  3. Labourers employed in labour not Agricultural—as Miners, Quarriers, Fishermen, Porters, &c.
  4. Male Servants.
  5. Other Males, 20 years of age.

The defects of this arrangement must be self-evident to all who have paid the least attention to economical science. It offends against both the laws of logical division, the parts being neither distinct nor equal to the whole. In the first place, what is a manufacturer? and how is such an one to be distinguished from one employed in handicraft? How do the workers in metal, as the "tin manufacturers," "lead manufacturers," "iron manufacturers"—who are one and all classed under the head of manufacturers—differ, in an economical

Somerset	43·5
Berks	41·7
Cornwall	41·7
Derby	40·0
Southampton	38·4
Oxford	37·0
Suffolk	37·0
Sussex	37·0
Cambridge	35·8
Devon	34·5
Essex	34·5
Norfolk	33·3
Northampton	33·3
York, East Riding	33·3
Bucks	31·3
Dorset	28·6
Shropshire	28·6
Wilts	27·7
Northumberland	25·6
Huntingdon	25·0
Rutland	25·0
Lincoln	23·8
South Wales	22·2
Cumberland	20·0
North Wales	19·6
Hereford	18·2
York, North Riding	15·2
Westmorland	12·0

COMPARISON OF THE DENSITY OF THE POPULATION IN 1841 AND 1851.

	1841.	1851.
Agricultural Counties.		
Lincoln	21·7	23·8
Rutland	22·7	25·0
Huntingdon	25·0	25·0
Cambridge	30·3	35·8
Essex	35·7	34·5
Sussex	32·2	37·0
Hereford	20·8	18·2
Agricultural and Submanufacturing Counties.		
Westmorland	11·6	12·0
Norfolk	32·2	33·3
Suffolk	33·3	37·0
Hertford	40·0	43·5
Bedford	37·0	43·5
Buckingham	33·3	31·3
Northampton	31·2	33.3
Oxford	34·4	37·0
Berks	34·4	41·7
Hants	47·6	38·4
Wilts	30·3	27·7
Dorset	27·7	28·6
Somerset	41·6	43·5
Devon	32·2	34·5
Sub-Agricultural and Sub-Manufacturing County.		
Gloucester	55·5	26·1
Manufacturing Counties.		
Lancaster	166·6	200·0
Yorkshire	42·6	48·7
Chester	58·8	65·2
Nottingham	47·6	55·5
Leicester	43·0	45·4
Warwick	71·4	83·3
Worcester	52·6	55·5

	1841.	1851.
Mining Counties.		
Durham	47·6	62·5
Cornwall	41·6	41·7
Manufacturing and Sub-Mining Counties.		
Derby	41·6	40·0
Stafford	71·4	83·3
Agricultural and Sub-Mining Counties.		
Shropshire	28·5	28·6
North Wales	19·3	19·6
South Wales	19·0	22·2
Sub-Agricultural and Sub-Mining Counties.		
Northumberland	21·2	25·6
Cumberland	18·5	20·0
Monmouth	43·0	55·5
Metropolitan County.		
Middlesex	1000·0	1059·0
Sub-Metropolitan Counties.		
Surrey	125·0	141·0
Kent	55·5	63·6

NOTE.—An *Agricultural* county has *more than* 10 per cent., and a *Sub-Agricultural* county *less than* 10 per cent. of its population employed in agriculture.

A *Manufacturing* county has *more* than 15 per cent., and a *Sub-Manufacturing* county *less than* 15 per cent. of its population employed in manufacture.

A *Mining* county has *more than* 5 per cent., and a *Sub-Mining* county *less than* 5 per cent. of its population employed in mining.

point of view, from the workers in wood, as the carpenters and joiners, the cabinet-makers, ship-builders, &c., who are all classed under the head of handicraftsmen? Again, according to the census of 1831, a brewer is placed among those employed in retail trade or in handicrafts, while a vinegar maker is ranked with the manufacturers. According to Mr. Babbage, *manufacturing* differs from mere *making* simply in the quantity produced—he being a manufacturer who makes a greater number of the same articles; manufacturing is thus simply production in a large way, in connection with the several handicrafts. Dr. Ure, however, appears to consider such articles manufactures as are produced by means of machinery, citing the word which originally signified production by hand (being the Latin equivalent for the Saxon *handicraft*) as an instance of those singular verbal corruptions by which terms come to stand for the very opposite to their literal meaning. But with all deference to the Doctor, for whose judgment I have the highest respect, Mr. Babbage's definition of a manufacturer, viz., as a producer on a large scale, appears to me the more correct; for it is in this sense that we speak of manufacturing chemists, boot and shoe manufacturers, ginger-beer manufacturers, and the like.

The Occupation Abstract of the Census of 1841, though far more comprehensive than the one preceding it, is equally unsatisfactory and unphilosophical. In this document the several members of Society are thus classified :—

I. *Persons engaged in Commerce, Trade, and Manufacture.*
II. *Agriculture.*
III. *Labour, not Agricultural.*
IV. *Army and Navy Merchant Seamen, Fishermen, and Watermen.*
V. *Professions and other pursuits requiring education.*
VI. *Government, Civil Service, and Municipal and Parochial Officers.*
VII. *Domestic Servants.*
VIII. *Persons of Independent Means.*
IX. *Almspeople, Pensioners, Paupers, Lunatics, and Prisoners.*
X. *Remainder of Population, including Women and Children.*

Here it will be seen that the defects arising from drawing distinctions where no real differences exist, are avoided, those engaged in handicrafts being included under the same head as those engaged in manufacture; but the equally grave error of confounding or grouping together occupations which are essentially diverse, is allowed to continue. Accordingly, the first division is made to include those who are engaged in trade and commerce as well as manufacture, though surely—the one belongs strictly to the distributing, and the other to the producing class—occupations which are not only essentially distinct, but, of which it is absolutely necessary for a right understanding of the state of the country that we know the proportion that the one bears to the other. Again, the employers in both cases are confounded with the employed, so that, though the capitalists who supply the materials, and pay the wages for the several kinds of work are a distinct body of people from those who *do* the work, and a body, moreover, that it is of the highest possible importance, in an economical point of view, that we should be able to estimate numerically,—no attempt is made to discriminate the one from the other. Now these three classes, distributors, employers, and operatives, which in the Government returns of the people are jumbled together in one heterogeneous crowd, as if the distinctions between Capital, Labour, and Distribution had never been propounded, are precisely those concerning which the social inquirer desires the most minute information.

The Irish census is differently arranged from that of Great Britain. There the several classes are grouped under the following heads:—

I. *Ministering to Food.*
  1. As Producers.
  2. As Preparers.
  3. As Distributors.
II. *Ministering to Clothing.*
  1. As Manufacturers of Materials.
  2. As Handicraftsmen and Dealers.
III. *Ministering to Lodging, Furniture, Machinery, &c.*
IV. *Ministering to Health.*
V. *Ministering to Charity.*
VI. *Ministering to Justice.*
VII. *Ministering to Education.*
VIII. *Ministering to Religion.*
IX. *Various Arts and Employments, not included in the foregoing.*
X. *Residue of Population*, not having specified occupations, and including unemployed persons and women.

This, however, is no improvement upon the English classification. There is the same want of discrimination, and the same dis-

regard of the great "economical" divisions of society.

Moreover, to show the extreme fallacy of such a classification, it is only necessary to make the following extract from the Report of the Commissioners for Great Britain:—

"We would willingly have given a classification of the occupations of the inhabitants of Great Britain into the various wants to which they respectively minister, but, in attempting this, we were stopped by the various anomalies and uncertainties to which such a classification seemed necessarily to lead, from the fact that many persons supply more than one want, though they can only be classed under one head. Thus to give but a single instance—*the farmer and grazier may be deemed to minister quite as much to clothing by the fleece and hides as he does to food by the flesh of his sheep and cattle.*"

He, therefore, who would seek to elaborate the natural history of the industry of the people of England, must direct his attention to some social philosopher, who has given the subject more consideration than either princes or Government officials can possibly be expected to devote to it. Among the whole body of economists, Mr. Stuart Mill appears to be the only man who has taken a comprehensive and enlightened view of the several functions of society. Following in the footsteps of M. Say, the French social philosopher, he first points out concerning the products of industry, that labour is not creative of objects but of utilities, and then proceeds to say:—

"Now the utilities produced by labour are of three kinds; they are—

"First, utilities *fixed and embodied in outward objects;* by labour employed in investing external *material* things with properties which render them serviceable to human beings. This is the common case, and requires no illustration.

"Secondly, utilities *fixed and embodied in human beings;* the labour being in this case employed in conferring on human beings qualities which render them serviceable to themselves and others. To this class belongs the labour of all concerned in education; not only schoolmasters, tutors, and professors, but governments, so far as they aim successfully at the improvement of the people; moralists and clergymen, as far as productive of benefit; the labour of physicians, as far as instrumental in preserving life and physical or mental efficiency; of the teachers of bodily exercises, and of the various trades, sciences, and arts, together with the labour of the learners in acquiring them, and all labour bestowed by any persons, throughout life, in improving the knowledge or cultivating the bodily and mental faculties of themselves or others.

"Thirdly, and lastly, utilities *not fixed or embodied in any object,* but consisting in a mere *service rendered,* a pleasure given, an inconvenience or pain averted, during a longer or a shorter time, but without leaving a *permanent* acquisition in the improved qualities of any person or thing; the labour here being employed in producing an utility *directly,* not (as in the two former cases) in *fitting some other* thing to afford an utility. Such, for example, is the labour of the musical performer, the actor, the public declaimer or reciter, and the showman.

"Some good may, no doubt, be produced beyond the moment, upon the feeling and disposition, or general state of enjoyment of the spectators; or instead of good there may be harm, but neither the one nor the other is the effect intended, is the result for which the exhibitor works and the spectator pays, but the immediate pleasure. Such, again, is the labour of the army and navy; they, at the best, prevent a country from being conquered, or from being injured or insulted, which is a service, but in all other respects leave the country neither improved nor deteriorated. Such, too, is the labour of the legislator, the judge, the officer of justice, and all other agents of Government, in their ordinary functions, apart from any influence they may exert on the improvement of the national mind. The service which they render is to maintain peace and security; these compose the utility which they produce. It may appear to some that carriers, and merchants or dealers, should be placed in this same class, since their labour does not add any properties to objects, but I reply that it does, it adds the property of being in the place where they are wanted, instead of being in some other place, which is a very useful property, and the utility it confers is embodied in the things themselves, which now actually are in the place where they are required for use, and in consequence of that increased utility could be sold at an increased price proportioned to the labour expended in conferring it. This labour, therefore, does not belong to the third class, but to the first."

To the latter part of the above classification, I regret to say I cannot assent. Surely the property of being in the place where they are wanted, which carriers and distributors are said to confer on external objects, cannot be said to be fixed—if, in-

HARVARD UNIVERSITY

deed, it be strictly *embodied* in the objects, since the very act of distribution consists in the alteration of this local relation, and transferring such objects to the possession of another. Is not the utility which the weaver fixes and embodies in a yard of cotton, a very different utility from that effected by the linendraper in handing the same yard of cotton over the counter in exchange for so much money? and in this particular act, it would be difficult to perceive what is fixed and embodied, seeing that it consists essentially in an exchange of commodities.

Mr. Mill's mistake appears to consist in not discerning that there is another class of labour besides that employed in producing utilities *directly*, and that occupied in *fitting other things* to afford utilities: viz., that which is engaged in *assisting* those who are so occupied in fitting things to be useful. This class consists of such as are engaged in aiding the producers of permanent material utilities either *before* or during production, and such as are engaged in aiding them *after* production. Under the first division are comprised capitalists, or those who supply the materials and tools for the work, superintendents and managers, or those who direct the work, and labourers, or those who perform some minor office connected with the work, as in turning the large wheel for a turner, in carrying the bricks to a bricklayer, and the like; while in the second division, or those who are engaged in assisting producers *after* production, are included carriers, or those who remove the produce to the market, and dealers and shopmen, or those who obtain purchasers for it. Now it is evident that the function of all these classes is merely *auxiliary* to the labour of the producers. consisting principally of so many modes of economizing their time and labour. Whether the gains of some of these auxiliary classes are as disproportionately large, as the others are disproportionately small, this is not the place to inquire. My present duty is merely to record the fact of the existence of such classes, and to assign them their proper place in the social fabric, as at present constituted.

Now, from the above it will appear, that there are four distinct classes of workers:—

I. Enrichers, or those who are employed in producing utilities fixed and embodied in material things, that is to say, in producing exchangeable commodities or riches.

II. Auxiliaries, or those who are employed in aiding the production of exchangeable commodities.

III. Benefactors, or those who are employed in producing utilities fixed and embodied in human beings, that is to say, in conferring upon them some permanent good.

IV. Servitors, or those who are employed in rendering some service, that is to say, in conferring some temporary good upon another.

Class 1 is engaged in investing *material* objects with qualities which render them serviceable to others.

Class 2 is engaged in aiding the operations of Class 1.

Class 3 is engaged in conferring on *human beings* qualities which render them serviceable to themselves or others.

Class 4 is engaged in giving a pleasure, averting a pain (during a longer or shorter period), or preventing an inconvenience, by performing some office for others that they would find irksome to do for themselves.

Hence it appears that the operations of the first and third of the above classes, or the Enrichers and Benefactors of Society, tend to leave some *permanent acquisition* in the improved qualities of either persons or things,—whereas the operations of the second and fourth classes, or the Auxiliaries and Servitors, are limited merely to promoting either the labours or the pleasures of the other members of the community.

Such, then, are the several classes of Workers; and here it should be stated that, I apply the title Worker to all those who do *anything* for their living, who perform any act whatsoever that is considered worthy of being paid for by others, without regard to the question whether such labourers tend to add to or decrease the aggregate wealth of the community. I consider all persone doing or giving something for the comforts they obtain, as self-supporting individuals. Whether that something be really an equivalent for the emoluments they receive, it is not my vocation here to inquire. Suffice it some real or imaginary benefit is conferred upon society, or a particular individual, and what is thought a fair and proper reward is given in return for it. Hence I look upon soldiers, sailors, Government and parochial officers, capitalists, clergymen, lawyers, wives, &c., &c., as self-supporting —a certain amount of labour, or a certain desirable commodity, being given by each and all in exchange for other commodities,

Digitized by Google
Original from HARVARD UNIVERSITY

which are considered less desirable to the individuals parting with them, and more desirable to those receiving them.

Nevertheless, it must be confessed that, economically speaking, the most important and directly valuable of all classes are those whom I have here denominated Enrichers. These consist not only of Producers, but of the Collectors and Extractors of Wealth, concerning whom a few words are necessary.

There are three modes of obtaining the materials of our wealth—(1) by collecting, (2) by extracting, and (3) by producing them. The industrial processes concerned in the collection of the materials of wealth are of the rudest and most primitive kind—being pursued principally by such tribes as depend for their food, and raiment, and shelter, on the spontaneous productions of nature. The usual modes by which the collection is made is by gathering the vegetable produce (which is the simplest and most direct form of all industry), and when the produce is of an animal nature, by hunting, shooting, or fishing, according as the animal sought after inhabits the land, the air, or the water. In a more advanced state of society, where the erection of places of shelter has come to constitute one of the acts of life, the felling of trees will also form one of the modes by which the materials making up the wealth of the nation are collected. In Great Britain there appears to be fewer people connected with the mere *collection* of wealth than with any other general industrial process. The fishermen are not above 25,000, and the wood-cutters and woodmen not 5000; so that even with gamekeepers, and others engaged in the taking of game, we may safely say that there are about 30,000 out of 18,000,000, or only one-six hundredth of the entire population, engaged in this mode of industry—a fact which strongly indicates the artificial character of our society.

The *production* of the materials of wealth, which indicates a far higher state of civilization, and which consists in the several agricultural and farming processes for increasing the natural stock of animal and vegetable food, employs upwards of one million; while those who are engaged in the *extraction* of our treasures from the earth, either by mining or quarrying, both of which processes—depending, as they do, upon a knowledge of some of the subtler natural powers — could only have been brought into operation in a highly advanced stage of the human intellect, number about a quarter of a million. Altogether, there appear to be about one million and a half of individuals engaged in the industrial processes connected with the collection, extraction, and production of the materials of wealth; those who are employed in operating upon these materials, in the fashioning of them into manufactures, making them up into commodities, as well as those engaged in the distribution of them—that is to say, the transport and sale of them when so fashioned or made up—appear to amount to another two millions and a half, so that the industrial classes of Great Britain, taken altogether, may be said to amount to four millions. For the more perfect comprehension, however, of the several classes of society, let me subjoin a table in round numbers, calculated from the census of 1841, and including among the first items both the employers as well as employed :—

Engaged in Trade and Manufacture	3,000,000	
,, Agriculture . . .	1,500,000	
,, Mining, Quarrying, and Transit . . .	750,000	
Total Employers and Employed .		5,250,000
Domestic Servants		1,000,000
Independent persons . . .		500,000
Educated pursuits (including Professions and Fine Arts) . . .		200,000
Government Officers (including Army, Navy, Civil Service, and Parish Officers)		200,000
Alms-people (including Paupers, Prisoners, and Lunatics) . .		200,000
		7,350,000
Residue of Population (including 3,500,000 wives and 7,500,000 children)		11,000,000
		18,350,000

Now, of the 5,250,000 individuals engaged in Agriculture, Mining, Transit, Manufacture and Trade, it would appear that about one million and a quarter may be considered as employers; and, consequently, that the remaining four millions may be said to represent the numerical strength of the operatives of England and Scotland. Of these about one million, or a quarter of the whole, may be said to be engaged in producing the materials of wealth; and about a quarter of a million, or one-sixteenth of the entire number, in extracting from the soil the substances upon which many of the manufacturers have to operate.

The artizans, or those who are engaged in the several handicrafts or manufactures operating upon the various materials of wealth thus obtained, are distinct from the workmen above-mentioned, belonging to what are called skilled labourers, whereas those who are employed in the collection, extraction, or growing of wealth, belong to the unskilled class.

An artisan is an *educated* handicrafts-

man, following a calling that requires an apprenticeship of greater or less duration in order to arrive at perfection in it; whereas a labourer's occupation needs no education whatever. Many years must be spent in practising before a man can acquire sufficient manual dexterity to make a pair of boots or a coat; dock labour or porter's work, however, needs neither teaching nor learning, for any man can carry a load or turn a wheel. The artisan, therefore, is literally a handicraftsman—one who by practice has acquired manual dexterity enough to perform a particular class of work, which is consequently called "skilled." The natural classification of artisans, or skilled labourers, appears to be according to the materials upon which they work, for this circumstance seems to constitute the peculiar quality of the art more than the tool used—indeed, it appears to be the principal cause of the modification of the implements in different handicrafts. The tools used to fashion, as well as the instruments and substances used to join the several materials operated upon in the manufactures and handicrafts, differ according as those materials are of different kinds. We do not, for instance, attempt to saw cloth into shape nor to cut bricks with shears; neither do we solder the soles to the upper leathers of our boots, nor nail together the seams of our shirts. And even in those crafts where the means of uniting the materials are similar, the artisan working upon one kind of substance is generally incapable of operating upon another. The tailor who stitches woollen materials together would make but a poor hand at sewing leather. The two substances are joined by the same means, but in a different manner, and with different instruments. So the turner, who has been accustomed to turn wood, is unable to fashion metals by the same method.

The most natural mode of grouping the artisans into classes would appear to be according as they pursue some *mechanical* or *chemical* occupation. The former are literally mechanics or handicraftsmen —the latter chemical manufacturers. The handicraftsmen consist of (1) The workers in silk, wool, cotton, flax, and hemp—as weavers, spinners, knitters, carpet-makers, lace-makers, rope-makers, canvas-weavers, &c. (2) The workers in skin, gut, and feathers—as tanners, curriers, furriers, feather dressers, &c. (3) The makers up of silken, woollen, cotton, linen, hempen, and leathern materials—as tailors, milliners, shirt-makers, sail-makers, hatters, glove-makers, saddlers, and the like. (4) The workers in wood, as the carpenters, the cabinet-makers, &c. (5) The workers in cane, osier, reed, rush, and straw—as basket-makers, straw-plait manufacturers, thatchers, and the like. (6) The workers in brick and stones —as bricklayers, masons, &c. (7) The workers in glass and earthenware—as potters, glass-blowers, glass-cutters, bottle-makers, glaziers, &c. (8) The workers in metals—as braziers, tinmen, plumbers, goldsmiths, pewterers, coppersmiths, iron-founders, blacksmiths, whitesmiths, anchor-smiths, locksmiths, &c. (9) The workers in paper—as the paper-makers, cardboard-makers. (10) The chemical manufacturers —as powder-makers, white-lead-makers, alkali and acid manufacturers, lucifer-match-makers, blacking-makers, ink-makers, soap-boilers, tallow-chandlers, &c. (11) The workers at the superlative or extrinsic arts—that is to say, those which have no manufactures of their own, but which are engaged in adding to the utility or beauty of others—as printing bookbinding, painting, and decorating, gilding, burnishing, &c.

The circumstances which govern the classification of *trades* are totally different from those regulating the division of work. In trade the convenience of the purchaser is mainly studied, the sale of such articles being associated as are usually required together. Hence the master coachmaker is frequently a harness manufacturer as well, for the purchaser of the one commodity generally stands in need of the other. The painter and house-decorator not only follows the trade of the glazier, but of the plumber, too; because these arts are one and all connected with the "doing up" of houses. For the same reason the builder combines the business of the plasterer with that of the bricklayer, and not unfrequently that of the carpenter and joiner in addition. In all of these businesses, however, a distinct set of workmen are required, according as the materials operated upon are different.

We are now in a position to proceed with the arrangement of the several members of society into different classes, according to the principles of classification which have been here laid down. The difficulties of the task, however, should be continually borne in mind; for where so many have failed it cannot be expected that perfection can be arrived at by any one individual; and, slight as the labour of such a task may at the first glance appear to some, still the system here propounded has been the work and study of many months.

CLASSIFICATION

OF

THE WORKERS AND NON-WORKERS

OF GREAT BRITAIN.

THOSE WHO WILL WORK.

I. Enrichers, as the Collectors, Extractors, or Producers of Exchangeable Commodities.

II. Auxiliaries, as the Promoters of Production, or the Distributors of the Produce.

III. Benefactors, or those who confer some permanent benefit, as Educators and Curators engaged in promoting the physical, intellectual, or spiritual well-being of the people.

IV. Servitors, or those who render some temporary service, or pleasure, as Amusers, Protectors, and Servants.

THOSE WHO CANNOT WORK.

V. Those who are provided for by some public Institution, as the Inmates of workhouses, prisons, hospitals, asylums, almshouses, dormitories, and refuges.

VI. Those who are unprovided for, and incapacitated for labour, either from want of power, from want of means, or from want of employment.

THOSE WHO WILL NOT WORK.

VII. Vagrants.

VIII. Professional Beggars.

IX. Cheats.

X. Thieves.

XI. Prostitutes.

THOSE WHO NEED NOT WORK.

XII. Those who derive their income from rent.

XIII. Those who derive their income from dividends.

XIV. Those who derive their income from yearly stipends.

XV. Those who derive their income from obsolete or nominal offices.

XVI. Those who derive their income from trades in which they do not appear.

XVII. Those who derive their income by favour from others.

XVIII. Those who derive their support from the head of the family.

THOSE WHO WILL WORK.

I. *Enrichers*, or those engaged in the collection, extraction, or production of exchangeable commodities.

A. COLLECTORS.
1. Fishermen.
2. Woodmen.
3. Sand and Clay-collectors.
4. Copperas, Cement-stones, and other finders.

B. EXTRACTORS.
1. Miners.
   a. Coal.
   b. Salt.
   c. Iron, Lead, Tin, Copper, Zinc, Manganese.
2. Quarryers.
   a. Slate.
   b. Stone.

C. GROWERS.
1. Farmers.
   a. Capitalist Farmers.
      i. Yeomen, or Proprietary Farmers.
      ii. Tenant Farmers.
   b. Peasant Farmers.
      i. Peasant Proprietors, as the Cumberland "Statesmen."
      ii. "Metayers," or labourers paying the landlord a certain portion of the produce as rent for the use of the land.
      iii. "Cottiers," or labouring Tenant Farmers.
2. Graziers.
3. Gardeners, Nurserymen, Florists.

D. MAKERS OR ARTIFICERS.
1. Mechanics.
   a. Workers in Silk, Wool, Worsted, Hair, Cotton, Flax, Hemp, Coir.
   b. Workers in Skin, Gut, and Feathers.
   c. Workers in Woollen, Silken, Cotton, Linen, and Leathern Materials.
   d. Workers in Wood, Ivory, Bone, Horn, and Shell.
   e. Workers in Osier, Cane, Reed, Rush, and Straw.
   f. Workers in Stone and Brick.
   g. Workers in Glass and Earthenware.
   h. Workers in Metal.
   i. Workers in Paper.
2. Chemical Manufacturers.
   a. Acid, Alkali, Alum, Copperas, Prussian-Blue, and other Manufacturers.
   b. Gunpowder Manufacturers, Percussion-Cap, Cartridge, and Firework Makers.
   c. Brimstone and Lucifer-match Manufacturers.
   d. White-lead, Colour, Black-lead, Whiting, and Blue Manufacturers.
   e. Oil and Turpentine Distillers, and Varnish Manufacturers.
   f. Ink Manufacturers, Sealing-wax and Wafer Makers.
   g. Blacking Manufacturers.
   h. Soap Boilers and Grease Makers.
   i. Starch Manufacturers.
   j. Tallow and Wax Chandlers.
   k. Artificial Manure Manufacturers.

l. Artificial Stone and Cement Manufacturers.
m. Asphalte and Tar Manufacturers.
n. Glue and Size Makers.
o. Polishing Paste, and Glass and Emery Paper Makers.
p. Lime, Coke, and Charcoal Burners.
q. Manufacturing Chemists and Drug Manufacturers.
r. Workers connected with Provisions, Luxuries, and Medicines.
i. Bakers, and Biscuit Makers.
ii. Brewers.
iii. Soda-water and Ginger-beer Manufacturers.
iv. Distillers and Rectifiers.
v. British Wine Manufacturers.
vi. Vinegar Manufacturers.
vii. Fish and Provision Curers.
viii. Preserved Meats and Preserved Fruit Preparers.
ix. Sauce and Pickle Manufacturers.
x. Mustard Makers.
xi. Isinglass Manufacturers.
xii. Sugar Bakers, Boilers, and Refiners.
xiii. Confectioners and Pastry-cooks.
xiv. Rice and Farinaceous Food Manufacturers.
xv. Chocolate, Cocoa, and other Manufacturers of Substitutes for Tea.
xvi. Cigar, Tobacco, and Snuff Manufacturers.
xvii. Quack, and other Medicine Manufacturers, as Pills, Powders, Syrups, Cordials, Embrocations, Ointments, Plaisters, &c.

3. Workers connected with the Superlative Arts, that is to say, with those arts which have no products of their own, and are engaged either in adding to the beauty or usefulness of the products of other arts, or in inventing or designing the work appertaining to them.
a. Printers.
b. Bookbinders.
c. Painters, Decorators, and Gilders.
d. Writers and Stencillers.
e. Dyers, Bleachers, Scourers, Calenderers, and Fullers.
f. Print Colourers.
g. Designers of Patterns.
h. Embroiderers (of Muslin, Silk, &c.), and Fancy Workers.
i. Desiccators, Anti-dry-rot Preservers, Waterproofers.
j. Burnishers, Polishers, Grinders, Japanners, and French Polishers.
k. Engravers, Chasers, Die-Sinkers, Embossers, Engine-Turners, and Glass-Cutters.
l. Artists, Sculptors, and Carvers of Wood, Coral, Jet, &c.
m. Modellers and Moulders.
n. Architects, Surveyors, and Civil Engineers.
o. Composers.
p. Authors, Editors, and Reporters.

*** Operatives are divisible, *according to the mode in which they are paid*, into—
1. Day-workers.
2. Piece-workers.
3. "Lump" or Contract-workers, as at the docks.
4. Perquisite-workers, as waiters, &c.
5. "Kind" or Truck-workers, as the farm servants in the North of England, Domestic Servants and Milliners, Ballast-heavers, and men paid at "Tommy-shops."
6. Tenant-workers, or those who lodge with or reside in houses belonging to their employers. The Slop-working Tailors generally lodge with the "Sweaters," and the "Hinds" of Northumberland, Cumberland, and Westmoreland have houses found them by their employers. These "Hinds" have to keep a

Digitized by Google
Original from HARVARD UNIVERSITY

"Bondager," that is, a female in the house ready to answer the master's call, and to work at stipulated wages.

7. Improvement-workers, or those who are considered to be remunerated for their work by the instruction they receive in doing it; as "improvers" and apprentices. The wages of "society-men" among operatives are settled by *custom*, the wages of "non-society-men" are settled by *competition*.
8. Tribute-workers, as the Cornish Miners, Whalers, and Weavers in some parts of Ireland, where a certain proportion of the proceeds of the work done belongs to the workmen.

Operatives are also divisible, *according to the places at which they work*, into—

1. Domestic workers, or those who work at home.
2. Shop or Factory workers, or those who work on the employer's premises.
3. Out-door workers, or those who work in the open air, as bricklayers, agricultural labourers, &c.
4. Jobbing-workers, or those who go out to work at private houses.
5. Rent-men, or those who pay rent for
   a. A "seat" at some domestic worker's rooms.
   b. "Power," as turners, and others, when requiring the use of a steam-engine. Some operatives have to pay rent for tools or "frames," as the sawyers and "stockingers," and some for gas when working on their employer's premises.

Operatives are further divisible, according to those whom they employ to assist them, into—

1. Family workers, or those who avail themselves of the assistance of their wives and children, as the Spitalfields Weavers.
2. "Sweaters" and Piece-master workers, or those who employ other members of their trade at less wages than they themselves receive.
3. "Garret-master" workers, or those who avail themselves of the labour of apprentices.

Operatives are moreover divisible, *according to those by whom they are employed*, into—

1. "Flints" and "Dungs;" "Whites" and "Blacks," according as they work for employers who pay or do not pay "society prices."
2. Jobbing piece-workers, or those who work single-handed for the public (without the intervention of an "employer") and are paid by the *piece*. These mostly do the work at their own homes, as cobblers, repairers, &c.
3. Jobbing day-workers, or those who work single-handed for the public (without the intervention of an "employer") and are paid by the *day*. These mostly go out to work at persons' houses and frequently have their food found them. Among the tailors and carpenters this practice is called "whipping the cat."
4. "Co-operative men," or those who work in "association" for their own profit, obtaining their work directly from the public, without the intervention of an "employer."

Lastly, Operatives admit of being arranged into two distinct classes, viz., the superior, or higher-priced, and the inferior, or lower-priced.

The superior, or higher-priced, operatives consist of—

1. The skilful.
2. The trustworthy.
3. The well-conditioned.

The inferior, or lower-priced operatives, on the other hand, are composed of—

1. The unskilful, as the old or superannuated, the young (including apprentices and "improvers"), the slow, and the awkward.

Original from HARVARD UNIVERSITY

2. The untrustworthy, as the drunken, the idle, and the dishonest. Some of the cheap workers, whose wages are minimized almost to starvation point, so that honesty becomes morally impossible, have to deposit a certain sum of money, or to procure two householders to act as security for the faithful return of the work given out to them.
3. The inexpensive, consisting of—
   a. Those who can live upon less, as single men, foreigners, Irishmen, women, &c.
   b. Those who derive their subsistence from other sources, as Wives, Children, Paupers, Prisoners, Inmates of Asylums, Prostitutes, and Amateurs (or those who work at a business merely for pocket-money).
   c. Those who are in receipt of some pecuniary or other aid, as Pensioners, Allottees of land, and such as have out-door relief from the workhouse.

II. *Auxiliaries*, or those engaged in promoting the enrichment and distributing the riches of the community.

A. Promoters of Production.
1. Employers.
   a. Administrative Employers, or those who supply wholesale or retail dealers. These are subdivisible into—
      i. Standard Employers, or those who work at the regular standard prices of the trade.
      ii. "Cutting" Employers, or those who work at less than the regular prices of the trade, as Contractors, &c.
   b. Executive Employers, or those who work directly for the public without the intervention of a wholesale or retail dealer, as Builders, &c.
   c. Distributive Employers, or those who are both producers and retail traders.
      i. Those who retail what they produce, as Tailors, Shoemakers, Bakers, Eating-house Keepers, Street Mechanics, &c.
      ii. Those who retail other things (generally provisions), and compel or expect the men in their employ to deal with them for those articles, as the Truck-Masters and others.
      iii. Those who retail the appurtenances of the trade to which they belong, and compel or expect the men in their employ to purchase such appurtenances of them, as trimmings in the tailors' trade, thread among the seamstresses, and the like.
   d. Middlemen Employers, or those who act between the employer and the employed, obtaining work from employers, and employing others to do it, as Sub-contractors, Sweaters, &c. These consist of—
      i. Trade-working Employers, or those who make up goods for other employers in the trade.
      ii. Garret-masters, or those who make up goods for the trade on the smallest amount of capital, and generally on speculation.
      iii. Trading Operative Employers, or those who obtain work in considerable quantities, and employ others at reduced wages to assist them in it, as "Sweaters," "Seconders," &c. These are either—
         α. Piece Masters, as those who take out a certain piece of work and employ others to help them at reduced wages.
         β. "Lumper" Employers, or those who contract to do the work by the lump, which is usually paid for by the piece, and employ others at reduced wages in order to complete it.

   *** Employers are known among operatives as "honourable" or "dishonourable," according as the wages they pay are those, or less than those, of the Trade Society.
2. Superintendents, or those who look after the workmen on behalf of employers.

a. Managers.
b. Clerks of the Works.
c. Foremen.
d. Overlookers.
e. Tellers and Meters, or those who take note of the number and quantity of the articles delivered.
f. Provers, or those whose duty it is to examine the quality or weight of the articles delivered.
g. Timekeepers, or those who note the time of the operatives coming to and quitting labour.
h. Gatekeepers, or those who see that no goods are taken out.
i. Clerks, or those who keep accounts of all sales and purchases, incomings, and outgoings of the business.
j. Pay Clerks, or those who pay the workmen their wages.

3. Labourers.
a. Acting as motive powers.
i. Turning wheels, working pumps, blowing bellows.
ii. Wheeling, dragging, pulling, or hoisting loads.
iii. Shifting (scenes), or turning (corn).
iv. Carrying (bricks, as hodmen).
v. Driving (piles), ramming down (stones, as paviours).
vi. Pressing (as fruit, for juice ; seeds, for oil).
b. Uniting or putting one thing to another.
i. Feeding (furnace), laying-on (as for printing machines).
ii. Filling (as "fillers-in" of sieves at dust-yards).
iii. Oiling (engines), greasing (railway wheels), pitching or tarring (vessels), pasting paper (for bags).
iv. Mixing (mortar), kneading (clay).
v. Tying up (plants and bunches of vegetables).
vi. Folding (printed sheets).
vii. Corking (bottles), or caulking (ships).
c. Separating one thing from another.
i. Sifting (cinders), screening (coals).
ii. Picking (fruit, hops, &c.), shelling (peas), peeling, barking, and threshing.
iii. Winnowing.
iv. Weeding and stoning.
v. Reaping and mowing.
vi. Felling, lopping, hewing, chopping (as fire-wood), cutting (as chaff), shearing (sheep).
vii. Sawing.
viii. Blasting.
viii. Breaking (stones), crushing (bones and ores), pounding (drugs).
ix. Scouring (as sand from castings), scraping (ships).
d. Excavating, sinking, and embanking.
i. Tunnelling.
ii. Sinking foundations.
iii. Boring.
iv. Draining, trenching, ditching, and hedging.
v. Embanking.
vi. Road-making, cutting.

B. Distributors of Production.

1. Dealers, or those who are engaged in the buying and selling of commodities on their own account.
a. Merchants or Importers, and Exporters.
b. Wholesale Traders.
c. Retail Traders.
d. Contracting Purveyors, or those who supply goods by agreement.
e. Contractors for work or repairs, as Road Contractors, and others.

f. Contractors for privileges, as the right of Printing the Catalogue of the Great Exhibition, or selling refreshments at Railway Stations, &c.
g. Farmers of revenues from dues, tolls, &c.
h. Itinerants, or those who seek out the Customers, instead of the Customers seeking out them.
 i. Hawkers, or those who cry their goods.
 ii. Pedlars, or those who carry their goods round.

2. Agents, or those who are engaged in the buying or selling of commodities for others, as Land Agents, House and Estate Agents, Colonial and East India Agents, &c., &c.
a. Supercargoes.
b. Factors, or Consignees.
c. Brokers, Bill, Stock, Share, Ship, Sugar, Cotton, &c.
d. Commission Salesmen, or Unlicensed Brokers.
e. Buyers, or those who purchase materials or goods for Manufacturers, or Dealers.
f. Auctioneers, or those who sell goods on Commission to the highest bidder.

3. Lenders and Lettors-out, or those who receive a certain sum for the loan or use of a thing.
a. Lenders or Lettors-out of commodities, as—
 i. Job-horses, carriages, chairs and seats in parks, gardens, &c.
 ii. Plate, linen, furniture, piano-fortes, flowers, fancy dresses, Court suits, &c.
 iii. Books, newspapers, prints, and music.
b. Lettors-out of tenements and storage room, as—
 i. Houses.
 ii. Lodgings.
 iii. Warehouse-room for imports, &c., as at wharfs.
 iv. Warehouse-room for furniture and other goods.
c. Lenders of money, as—
 i. Mortgagees.
 ii. Bankers.
 iii. Bill-discounters.
 iv. Loan offices with and without policies of assurance.
 v. Building and investment societies.
 vi. Pawnbrokers.
 vii. Dolly shopmen.

*** The several modes of distributing goods or money are—
1. By private contract or agreement.
2. By a fixed or ticketed price.
3. By competition, as at Auctions.
4. By games of chance, as Lotteries (with the "Art Union"), Raffles (at Fancy Fairs), Tossing (with piemen and others), Prizes for skill (with throwing sticks, &c.), Betting, Racing, &c.

The places at which goods are distributed are—
1. Fairs, or annual gatherings of buyers and sellers.
2. Markets, or weekly gatherings of buyers and sellers.
3. Exchanges, or daily gatherings of merchants and agents.
4. Counting-houses, or the places of business of wholesale traders.
5. Shops, or the places of business of retail traders.
6. Bazaars, or congregations of shops.

4. Trade Assistants.
a. Shopmen and Warehousemen.
b. Shopwalkers.
c. Cashiers or Receivers.
d. Clerks.
e. Accountants.
f. Rent-Collectors.
g. Debt-collectors.

2. Private Servants temporarily engaged.
   a. Couriers.
   b. Interpreters.
   c. Monthly Nurses and Invalid Nurses.
   d. Waiters at Parties.
   e. Charwomen.
   f. Knife, boot, window, and paint Cleaners, Pot scourers, Carpet beaters.

3. Public Servants.
   a. Waiters at hotels and public gardens.
   b. Masters of the Ceremonies.
   c. Chamber-Maids.
   d. Boots.
   e. Ostlers.
   f. Job Coachmen.
   g. Post-boys.
   h. Washerwomen.
   i. Dustmen.
   j. Sweeps.
   k. Scavengers.
   l. Nightmen.
   m. Flushermen.
   n. Turncocks.
   o. Lamplighters.
   p. Horse Holders.
   q. Crossing Sweepers.

THOSE WHO CANNOT WORK.

V. *Those that are provided for by some Public Institution.*

A. The Inmates of Workhouses.

B. The Inmates of Prisons.
   1. Debtors.
   2. Criminals (Some of these, however, are made to work by the authorities).

C. The Inmates of Hospitals.
   1. The Sick.
   2. The Insane—as Lunatics and Idiots.
   3. Veterans—as Greenwich and Chelsea Hospital men.
   4. The Deserted Young—as the Foundling Hospital children.

D. The Inmates of Asylums and Almshouses.
   1. The Afflicted—as the Deaf, and Dumb, and Blind.
   2. The Destitute Young—as Orphans.
   3. The Decayed Members of the several Trades or Sects.
      a. Trade and Provident Asylums and Almshouses.
      b. Sectarian Asylums and Almshouses—as for aged Jews, Widows of Clergymen, &c.

E. The Inmates of the several Refuges and Dormitories for the Houseless and Destitute.

VI. *Those who are Unprovided for.*

A. Those who are incapacitated from Want of Power.
   1. Owing to their Age.
      a. The Old.
      b. The Young.

   2. Owing to some Bodily Ailment.
      a. The Sick.
      b. The Crippled.
      c. The Maimed.

d. The Paralyzed.
e. The Blind.
3. Owing to some Mental Infirmity.
a. The Insane.
b. The Idiotic.
c. The Untaught, or those who have never been brought up to any industrial occupation (as Widows and those who have "seen better days").

B. THOSE WHO ARE INCAPACITATED FROM WANT OF MEANS.
1. Having no tools (as is often the case with distressed carpenters).
2. Having no clothes (as servants when long out of a situation).
3. Having no stock-money (as impoverished street-sellers).
4. Having no materials (as the "used-up" garret or chamber masters in the boot and shoe or cabinet-making trade).
5. Having no place wherein to work (as when those who pursue their calling at home are forced to become the inmates of a nightly lodging-house).

C. THOSE WHO ARE INCAPACITATED FROM WANT OF EMPLOYMENT.
1. Owing to a glut or stagnation in business (as among the cotton-spinners, the iron-workers, the railway-navigators, and the like).
2. Owing to a change in fashion (as in the button-making trade).
3. Owing to the introduction of machinery (as among the sawyers, hand-loom weavers, pillow-lace makers, threshers, and others).
4. Owing to the advent of the slack season (as among the tailors and mantua-makers, and drawn-bonnet-makers).
5. Owing to the continuance of unfavourable weather.
a. From the prevalence of rain (as street-sellers, and others).
b. From the prevalence of easterly winds (as dock-labourers).
6. Owing to the approach of winter (as among the builders, brickmakers, market-gardeners, harvest-men).
7. Owing to the loss of character.
a. Culpably; from intemperate habits, or misconduct of some kind.
b. Accidentally; as when a servant's late master goes abroad, and a written testimonial is objected to.

THOSE WHO WILL NOT WORK.

VII. *Vagrants or Tramps.*

Under this head is included all that multifarious tribe of "sturdy rogues," who ramble across the country during the summer, sleeping at the "casual wards" of the workhouses, and who return to London in the winter to avail themselves of the gratuitous lodgings and food attainable at the several metropolitan refuges.

VIII. *Professional Beggars and their Dependents.*

A. NAVAL AND MILITARY BEGGARS.
1. Turnpike Sailors.
2. Spanish Legion Men, &c.
3. Veterans.

B. "DISTRESSED-OPERATIVE" BEGGARS.
1. Pretended Starved-out Manufacturers, as the Nottingham "Driz" or Lace-Men.
2. Pretended Unemployed Agriculturists.
3. Pretended Frozen-out Gardeners.
4. Pretended Hand-loom Weavers, and others deprived of their living by Machinery.

C. "RESPECTABLE" BEGGARS.
1. Pretended Broken-down Tradesmen, or Decayed Gentlemen.
2. Pretended Distressed Ushers, unable to take situation for want of clothes.

Generated at University of Pennsylvania on 2022-01-19 21:10 GMT / https://hdl.handle.net/2027/hvd.32044079430500

3. "Clean-Family Beggars" with children in very white pinafores, their faces newly washed, and their hair carefully brushed.
4. Ashamed Beggars, or those who "stand pad with a fakement" (remain stationary, holding a written placard), and pretend to hide their faces.

D. "Disaster" Beggars.
1. Shipwrecked Mariners.
2. Blown-up Miners.
3. Burnt-out Tradesmen.
4. Lucifer Droppers.

E. Bodily Afflicted Beggars.
1. Having real or pretended sores, vulgarly known as the "scaldrum dodge."
2. Having swollen legs.
3. Being crippled, deformed, maimed, or paralyzed.
4. Being blind.
5. Being subject to fits.
6. Being in a decline, and appearing with bandages round the head.
7. "Shallow coves," or those who exhibit themselves in the streets half clad, especially in cold weather.

F. Famished Beggars.
1. Those who chalk on the pavement, "I am starving."
2. Those who "stand pad" with a small piece of paper similarly inscribed.

G. Foreign Beggars.
1. Frenchmen who stop passengers in the street and request to know if they can speak French, previous to presenting a written statement of their distress.
2. Pretended Destitute Poles.
3. Hindoos and Negroes, who stand shivering by the kerb.

H. Petty Trading Beggars.
1. Tract sellers.
2. Sellers of lucifers, boot-laces, cabbage-nets, tapes, and cottons.

*** The several varieties of beggars admit of being sub-divided into—
a. Patterers, or those who beg on the "blob," that is, by word of mouth.
b. Screevers, or those who beg by *screeving*, that is, by written documents, setting forth imaginary cases of distress, such documents being either—
i. "Slums" (letters).
ii. "Fakements" (petitions).

I. The Dependents of Beggars.
1. Screevers Proper, or the writers of slums and fakements for those who beg by screeving.
2. Referees, or those who give characters to professional beggars when a reference is required.

IX. *Cheats and their Dependents.*

A. Those who Cheat the Government.
1. Smugglers defrauding the Customs.
2. "Jiggers" defrauding the Excise by working illicit stills, and the like.

B. Those who Cheat the Public.
1. Swindlers, defrauding those of whom they buy.
2. "Duffers" and "horse-chaunters," defrauding those to whom they sell.
3. "Charley-pitchers" and other low gamblers, defrauding those with whom they play.
4. "Bouncers and Besters" defrauding, by laying wagers, swaggering, or using threats.
5. "Flatcatchers," defrauding by pretending to find some valuable article—as Fawney or Ring-Droppers.

Generated at University of Pennsylvania on 2022-01-19 21:10 GMT / https://hdl.handle.net/2027/hvd.32044079430500

6. Bubble-Men, defrauding by instituting pretended companies—as Sham Next-of-Kin-Societies, Assurance and Annuity Offices, Benefit Clubs, and the like.
7. Douceur-Men, defrauding by offering for a certain sum to confer some boon upon a person as—
   a. To procure Government Situations for laymen, or benefices for clergymen.
   b. To provide Servants with Places.
   c. To teach some lucrative occupation.
   d. To put persons in possession of some information "to their advantage."
8. Deposit-Men, defrauding by obtaining a certain sum as security for future work or some promised place of trust.

C. The Dependents of Cheats are—
1. "Jollies," and "Magsmen," or accomplices of the "Bouncers and Besters."
2. "Bonnets," or accomplices of Gamblers.
3. Referees, or those who give false characters to swindlers and others.

X. *Thieves and their Dependents.*

A. Those who Plunder with Violence.
1. "Cracksmen"—as Housebreakers and Burglars.
2. "Rampsmen," or Footpads.
3. "Bludgers," or Stick-slingers, plundering in company with prostitutes.

B. Those who "Hocus," or Plunder their Victims when Stupified.
1. "Drummers," or those who render people insensible.
   a. By handkerchiefs steeped in chloroform.
   b. By drugs poured into liquor.
2. "Bug-hunters," or those who go round to the public-houses and plunder drunken men.

C. Those who Plunder by Manual Dexterity, by Stealth, or by Breach of Trust.
1. "Mobsmen," or those who plunder by manual dexterity—as the "light-fingered gentry."
   a. "Buzzers," or those who abstract handkerchiefs and other articles from gentlemen's pockets.
      i. "Stook-buzzers," those who steal handkerchiefs.
      ii. "Tail-Buzzers," those who dive into coat-pockets for sneezers (snuff-boxes,) skins and dummies (purses and pocket-books).
   b. "Wires," or those who pick ladies' pockets.
   c. "Prop-nailers," those who steal pins and brooches.
   d. "Thimble-screwers," those who wrench watches from their guards.
   e. "Shop-lifters," or those who purloin goods from shops while examining articles.
2. "Sneaksmen," or those who plunder by means of stealth.
   a Those who purloin goods, provisions, money, clothes, old metal, &c.
      i. "Drag Sneaks," or those who steal goods or luggage from carts and coaches.
      ii. "Snoozers," or those who sleep at railway hotels, and decamp with some passenger's luggage or property in the morning.
      iii. "Star-glazers," or those who cut the panes out of shop-windows.
      iv. "Till Friskers," or those who empty tills of their contents during the absence of the shopmen.
      v. "Sawney-Hunters," or those who go purloining bacon from cheese-mongers' shop-doors.
      vi. "Noisy-racket Men," or those who steal china and glass from outside of china-shops.
      vii. "Area Sneaks," or those who steal from houses by going down the area steps.
      viii. "Dead Lurkers," or those who steal coats and umbrellas from passages at dusk, or on Sunday afternoons.
      ix. "Snow Gatherers," or those who steal clean clothes off the hedges.
      x. "Skinners," or those women who entice children and sailors to go with them and then strip them of their clothes.

xi. "Bluey-Hunters," or those who purloin lead from the tops of houses.
xii. "Cat and Kitten Hunters," or those who purloin pewter quart and pint pots from the top of area railings.
xiii. "Toshers," or those who purloin copper from the ships along shore.
xiv. Mudlarks, or those who steal pieces of rope and lumps of coal from among the vessels at the river-side.

b. Those who steal animals.
i. Horse Stealers.
ii. Sheep, or "Woolly-bird," Stealers.
iii. Deer Stealers.
iv. Dog Stealers.
v. Poachers, or Game Stealers.
vi. "Lady and Gentlemen Racket Men," or those who steal cocks and hens.
vii. Cat Stealers, or those who make away with cats for the sake of their skins and bones.

c. Those who steal dead bodies—as the "Resurrectionists."

3. Those who plunder by breach of trust.
a. Embezzlers, or those who rob their employers.
i. By receiving what is due to them, and never accounting for it.
ii. By obtaining goods in their employer's name.
iii. By purloining money from the till.
b. Illegal Pawners.
i. Those who pledge work given out to them by employers.
ii. Those who pledge blankets, sheets, &c., from lodgings.
c. Dishonest servants, those who make away with the property of their masters.
d. Bill Stealers, or those who purloin bills of exchange entrusted to them, to get discounted.
e. Letter Stealers.

D. "Shoful Men," or those who Plunder by Means of Counterfeits.
1. Coiners or fabricators of counterfeit money.
2. Forgers of bank notes.
3. Forgers of checks and acceptances.
4. Forgers of wills.

E. Dependents of Thieves.
1. "Fences," or receivers of stolen goods.
2. "Smashers," or utterers of base coin or forged notes.

XI. *Prostitutes and their Dependents.*

A. Professional Prostitutes.
1. Seclusives, or those who live in private houses or apartments.
a. Kept Mistresses.
b. "Prima Donnas," or those who belong to the "first class," and live in a superior style.
2. Convives, or those who live in the same house with a number of others.
a. Those who are independent of the mistress of the house.
b. Those who are subject to the mistress of a brothel.
i. "Board Lodgers," or those who give a portion of what they receive to the mistress of the brothel, in return for their board and lodging.
ii. "Dress Lodgers," or those who give either a portion or the whole of what they get to the mistress of the brothel in return for their board, lodging, and clothes.
3. Those who live in low lodging-houses.
4. Sailors' and soldiers' women.
5. Park women, or those who frequent the parks at night, and other retired places.

6. Thieves' women, or those who entrap men into bye streets for the purpose of robbery.
7. The Dependents of Prostitutes:
   a. "Bawds," or Keepers of Brothels.
   b. Followers of Dress Lodgers.
   c. Keepers of Accommodation Houses.
   d. Procuresses, Pimps, and Panders.
   e. Fancy-Men.
   f. Magsmen and Bullies.

B. Clandestine Prostitutes.
1. Female Operatives.
2. Maid Servants.
3. Ladies of Intrigue.
4. Keepers of Houses of Assignation.

C. Cohabitant Prostitutes.
1. Those whose paramours cannot afford to pay the marriage fees.
2. Those whose paramours do not believe in the sanctity of the ceremony.
3. Those who have married a relative forbidden by law.
4. Those whose paramours object to marry them for pecuniary or family reasons.
5. Those who would forfeit their income by marrying, as officers' widows in receipt of pensions, and those who hold property only while unmarried.

THOSE WHO NEED NOT WORK.

XII. *Those who derive their income from rent.*

A. Landlords of Estates.
B. Landlords of Houses.

XIII. *Those who derive their income from dividends.*

A. Fundholders.
B. Shareholders.
1. In Mines.
2. In Canals.
3. In Railways.
4. In Public Companies.

XIV. *Those who derive their income from yearly stipends.*

A. Annuitants.
B. Pensioners.

XV. *Those who hold obsolete or nominal offices.*

Sinecurists.

XVI. *Those who derive their incomes from trades in which they never appear.*

A. Sleeping Partners.
B. Royalty Men.

XVII. *Those who derive their incomes by favour from some other.*

A. Protegés.
B. Dependents.

XVIII. *Those who derive their support from the head of the family.*

A. Wives.
B. Children.

OF THE NON-WORKERS.

THE exposition of the several members of society being finished, I now come to treat of that inoperative moiety of it, which more especially concerns us here. The non-workers, we have seen, consist of three broadly marked and distinct orders, viz:—

The incapacitated, or compulsory non-workers.

The indisposed, or voluntary non-workers.

The independent, or privileged non-workers.

It would be of the highest possible importance, could we ascertain with any precision the number of people existing in this country, who do no manner of work for their support; and I was anxious to have concluded the preceding account of the several divisions of society, with an estimate of the numbers appertaining to each of the four great classes, as well as the incomes accruing to them. I found, however, on consulting the official documents with this view, that the government returns were in such an economical tangle—distributor being confounded with employer, and employer again jumbled up with the employed—that any attempt to unravel the twisted yarn would have cost an infinity of trouble, and have been almost worthless after all; and it was from a long experience as to the incompetency of the official returns to aid the social inquirer in solving the great economical problems concerning the production and distribution of wealth, that I was induced to suggest to Sir George Grey (to whom I had been indebted for much courtesy and valuable information, and who, from the commencement of my investigations, had shown a readiness to afford me every assistance), that, in the ensuing census, an attempt should be made to obtain some definite account of the numbers of employers and employed, and I am happy to say that, in conformity with my suggestion, the next "Abstract of the Occupations of the People," will at least teach us the proportion between these two main elements of our social state; so that if the Distributors are but kept distinct from the Promoters and Producers of the wealth of the country, one important step towards a right understanding of the subject will assuredly have been made*.

It should, however, be borne in mind, that, though the distribution, the promotion, and the production of the riches or exchangeable commodities of a country are usually distinct offices in every civilized nation, they are not invariably separate functions, even in our own. The exceptions to the economical rule with us appear to be as follows:—

1. Sometimes the producers themselves supply the materials, tools, shelter, and subsistence, that they require for their work, though this is usually done by some capitalist; and having finished the work, proceed themselves to find purchasers for it likewise (though this is generally the office of the distributor or dealer). Street artizans, or those who make the goods they sell in the streets, may be cited as instances of a class uniting in itself the three functions of producer, capitalist (supplying the materials, &c.), and distributor.

2. Sometimes the capitalist employer is also the distributor of the commodities, such being the case with bakers, tailors,

* Mr. Mill's mistake in ranking the Employers and Distributors among the Enrichers, or those who increase the exchangeable commodities of the country, arose from a desire to place the dealers and capitalists among the productive labourers, than which nothing could be more idle, for surely they do not add, *directly*, one brass farthing, as the saying is, to the national stock of wealth. A little reflection would have shown that gentleman that the true function of employers and dealers was that of the *indirect aiders* of production rather than the direct producers. The economical scale of production appears to be as follows:—(1) The Employer, providing the materials, tools, and shelter necessary for the due performance of the work, together with the food for the subsistence of the artificer during the work. (2) The Labourer, fitting or preparing the materials for the artificer. (3) The Artificer or workman, positively doing the work and creating a new product. (4) The Superlative Artizan, engaged in adding to the beauty or utility of such product. (5) The Distributor or Dealer, engaged in carrying and disposing of the product in the best market. The functions of Nos. 1 and 2 generally precede production, those of Nos. 4 and 5 usually succeed it; while No. 3 is the absolute producer. The labours of No. 4, however, are so intimately associated with the produce—sometimes designing the work, and sometimes "finishing" it—that it seems but right that the superlative artizan should be ranked with the artificer; the mere labourer, however, who turns the wheel for the turner, or carries the bricks to the bricklayer and the like, cannot strictly be ranked as a *producer* any more than a porter or dock labourer.

and the like, who themselves "purvey" what they employ others to produce.

3. Sometimes the craft does not admit of a distributor being attached to it; the employer himself undertaking to supply the wants of the public; this is the case with the building and decoration of houses.

4. Sometimes the work is done directly for the public, without the intervention of either a distributor or trading-employer; such is the case with the jobbing, day, or piece workers—among the seamstresses and journeymen tailors, for instance—who "make up ladies' and gentlemen's own materials," either at home or at the houses of those for whom the work is done.

5. Sometimes the artificers or working men are their own capitalists; providing the materials, tools, shelter, and subsistence requisite for the work, as is the case with the garret and chamber-masters in the slop cabinet and shoe trades, and among the members of co-operative associations.

6. Sometimes the artificers are both employers and employed; being supplied with their materials and subsistence from a capitalist, and supplying them again to other artificers working under them; this is the case with sweaters, piece-working masters, first hands, and the like.

7. Sometimes the capitalist employer, on the other hand, is, or rather assumes to be, the proprietor of both the capital and labour; as is the case with the slave-owners, masters of serfs, bondmen, villeins, and the like; though this state of things, thank God, no longer exists in this country.

8. Sometimes the capitalist supplies all the requisites of production, excepting the subsistence of the artificer, who is remunerated by a certain share of the profits (if any); this is often the case with publishers and authors.

9. Sometimes the capitalist supplies only the materials and subsistence, but not the tools, of the artificers, and sometimes he compels them to pay him a rent for them out of their wages; as is the case with the employers of the sawyers and stockingers.

10. Sometimes the capitalist supplies the materials, tools, and subsistence of the artificers, but not the appliances of their work; and sometimes he compels them to purchase such appliances of him at an exorbitant profit; as the trimmings in the tailors' trade, thread with the seamstresses, and the like.

11. Sometimes the capitalist supplies the materials, tools, subsistence, and shelter of the artificers, but not their gas-light, and compels them to pay a rent for the same out of their wages.

12. Sometimes the capitalist supplies the materials, tools, appliances, and subsistence, but not the shelter, necessary for the due performance of the work, the artificers, in such cases, doing the work at their own homes.

But all this concerns the workers more directly than the non-workers of society, and it is mentioned here merely with the view of completing the classification before given. Our more immediate business in this place lies with the inoperative, rather than the operative, members of the community. Nor is it with the entire body of these that we have to deal, but rather with that third order of the non-working class who are unwilling, though able, to work, as contradistinguished from those who are willing, but unable, to do so. The non-workers are a peculiar class, including orders diametrically opposed to each other: the very rich and the very poor, in the first place, and the honest and dishonest in the second. The dishonest members of society constitute those who are known more particularly as the criminal class. Hence to inquire into their means of living and mode of life, involves an investigation into the nature and the extent of crime in this country. Crime, sin, and vice are three terms used for the infraction of three different kinds of laws—social, religious, and moral. Crime is the transgression of some social law, even as sin is the transgression of some religious law, and vice the breach of some moral one. These laws, however, often differ only in emanating from different authorities; while infractions of them are merely offences against different powers. To thieve is to offend at once socially, religiously, and morally; for not only does the social, but the religious and moral law, each and all, enjoin that we should respect the property of others.

But there are other crimes or offences against the social powers, besides such as are committed by those who will not work. The crimes perpetrated by those who object to labour for their living, are habitual crimes; whereas those perpetrated by the other classes of society are accidental crimes, arising from the pressure of a variety of circumstances. Here, then, we have a most important fundamental distinction: all crimes, and consequently all criminals, are divisible into two different classes, the professional and the casual; that is to say, there are two distinct orders of people continually offending against the laws of society, viz., those who do so as a regular means of living, and those who do so from some

Original from HARVARD UNIVERSITY

accidental cause. It is impossible to arrive at any accurate knowledge on the subject of crime generally, without making this first analysis of the several species of offences according to their causes; that is to say, arranging them into opposite groups or classes, according as they arise from an habitual indisposition to labour on the part of some of the offenders, or from the temporary pressure of circumstances upon others. The official returns, however, on this subject are as unphilosophic as the generality of such documents, and consist of a crude mass of undigested facts, being a statistical illustration of the "rudis indigestaque moles," in connection with a criminal chaos.

At present the several crimes of the country are officially divided into four classes:—

I. Offences against persons; including murder, rape, bigamy, assaults, &c.

II. Offences against property.

A. With violence; including burglary, robbery, piracy, &c.

B. Without violence; including embezzlement, cattle-stealing, larceny, and fraud.

C. Malicious offences against property; including arson, incendiarism, maiming cattle, &c.

III. Forgery and offences against the currency; including the forging of wills, bank-notes, and coining, &c.

IV. Other offences; including high-treason, sedition, poaching, smuggling, working illicit stills, perjury, &c.

M. Guerry, the eminent French statist, adopts a far more philosophic arrangement, and divides the several crimes into—

I. Crimes against the State; as high treason, &c.

II. Crimes against personal safety; as murder, assault, &c.

III. Crimes against morals (with and without violence); as rape, bigamy, &c.

IV. Crimes against property (proceeding from cupidity or malice); as larceny, embezzlement, incendiarism, and the like.

The same fundamental error which renders the government classification comparatively worthless, deprives that of the French philosopher of all practical value. It gives us no knowledge of the character of the people committing the crimes; being merely a system of criminal mnemonics, as it were, or easy method of remembering the several varieties of offences. The classes in both systems are but so many mental pigeon-holes for the orderly arrangement and partitioning of the various infractions of the law; further than this they cannot help us.

Whatever other information the inquirer may want, he must obtain for himself; if he wish to learn from the crimes something as to their causes, as well as the nature of the criminals, he must begin *de novo*, and, using the official facts, but rejecting the official system of classification, proceed to arrange all the several offences into two classes, according as they are of a professional and casual character, committed by habitual or occasional offenders. Adopting this principle, it will be found that the *non-professional* crimes consist mainly of murder, assaults, incendiarism, ravishment, bigamy, embezzlement, high treason, and the like; for it is evident that none can make a trade or profession of the commission of these crimes, or resort to them as a regular means of living*.

The *professional* crimes, on the other hand, will be generally found to include burglary, robbery, poaching, coining, smuggling, working of illicit stills, larceny from the person, simple larceny, &c., because each and every of these are regular crafts, requiring almost the same apprenticeship as any other mode of life. Burglary, coining, working illicit stills, and picking pockets, are all *arts* to which no man, without some previous training, can take. Hence to know whether the number of these dishonest *handicrafts*—for such they really are—be annually on the increase or not, is to solve a most important portion of the criminal problem; it is to ascertain whether crime pursued as a profession or business, is being augmented among us—to discover whether the criminal class, as a distinct portion of our people is, or is not, on the advance. The non-professional crimes will furnish us with equally curious results, showing a yearly impress of the character of the times; for being only occasional offences, of course the number of such offenders at different years will give us a knowledge of the intensity of the several occasions inducing the crimes in such years.

The accidental crimes, classified according to their causes, may be said to consist of—

I. Crimes of malice, exercised either against the person or the property of the object.

* At one time, however, murder became a *trade* in this country, namely, when the dead bodies of human beings grew to be of such value that the burking of the living was resorted to by the "resurrectionists," as a means of keeping up the supply.

II. Crimes of lust and perverted appetites; as rape, &c.
III. Crimes of shame; as concealing the births of infants, attempts to procure miscarriage, and the like.
IV. Crimes of temptation, } with, or without breach of trust.
V. Crimes of cupidity,
VI. Crimes of want,
VII. Crimes of political prejudices.

With the class of casual or accidental criminals, however, we are not at present concerned. Those who resort to crime as a means of support, when in a state of extreme want, for instance, cannot be said to belong to the *voluntary* non-workers, for many of these would willingly work to increase their sustenance, if that end were attainable by such means, but the poor shirt-workers, slop-tailors, and the like, have not the power of earning more than the barest subsistence by their labour, so that the pawning of the work entrusted to them by their employers, becomes an act to which they are immediately impelled for "dear life," on the occurrence of the least illness or mishap among them. Such *offenders*, therefore, belong more properly to those who cannot work for their living, or rather, who cannot live by their working, and though they offend against the laws in the same manner as those that will not work, they cannot certainly be said to be of the same class.

The *voluntary* non-workers are a distinct body of people. In the introductory chapter to the first volume of the "Street-folk," they have been shown to appertain to even the rudest nations, being as it were the human parasites of every civilized and barbarous community. The Hottentots have their "*Sonquas*," and the Kafirs their "*Fingoes*," as we have our "Prigs" and "Cadgers." Those who will not work for the food they consume, appear to be part and parcel of a State—an essential element of the social fabric as much as those who cannot, or need not work for their living. Go where you will, to what corner of the earth you please, search out or propound what new-fangled or obsolete form of society you may, there will be some members of it more apathetic than the rest, who object to work—some more infirm than the rest, who are denied the power to work—and some more thrifty than the rest, who from their past savings have no necessity to work for the future. These several forms are but the necessary consequences of specific differences in the constitution of different beings. Circumstances may tend to give an unnatural development to either one or other of the classes; the criminal class, the pauper class, or the wealthy class, may be in excess in one form of society, as compared with another, or they may be repressed by certain social arrangements; nevertheless, to a greater or less degree, there they will and *must* ever be.

Since, then, there *is* an essentially distinct class of people who *will* not work for their living, and since work is a necessary condition of the human organism, the question becomes, How do such people live? There is but one answer:—If they do not labour to procure their own food, of course they must live on the food procured by the labour of others. But how do they obtain possession of the food belonging to others? There are but two means: it must either be given to them by, or be taken from, the industrious portion of the community. Consequently, the next point to be settled is, what are the means by which those who *object* to work get their food given to them, and what the means by which they are enabled to take it from others. Let us begin with the last mentioned.

The means by which the criminal classes obtain their living constitute the essential points of difference among them, and form indeed the methods of distinction among themselves. The "Rampsmen," the "Drummers," the "Mobsmen," the "Sneaksmen," and the "Shofulmen,"* which are the terms by which they themselves designate the several branches of the "profession," are but so many expressions indicating the several modes of obtaining the property of which they become possessed.

The "*Rampsman*" or "*Cracksman*" plunders by force; as the burglar, footpad, &c.
The "*Drummer*" plunders by stupefaction; as the "hocusser."
The "*Mobsman*" plunders by manual dexterity; as the pickpocket.
The "*Sneaksman*" plunders by stealth; as the petty-larceny men and boys.
The "*Shofulman*" plunders by counterfeits; as the coiner.

Now each and all of these are distinct species of the genus, having often little or no connection with the others. The "Cracksman," or housebreaker, would no more think of associating with the "Sneaksman" than a barrister would dream of sitting down to dinner with an attorney; the perils braved by the housebreaker or the footpad make the cowardice of the sneaksman contemptible to him; and the one is distinguished by a

* The word Shoful is derived from the Danish *skuffe*, to shove, to deceive, cheat; the Saxon form of the same verb is *Scufan*, whence the English *Shove*.

kind of bulldog insensibility to danger, while the other is marked by a low cat-like cunning. The "Mobsman," on the other hand, is more of a handicraftsman than either, and is comparatively refined by the society he is obliged to keep. He usually dresses in the same elaborate style of fashion as a Jew on a Saturday (in which case he is more particularly described by the prefix "swell"), and "mixes" generally in the "best of company," frequenting—for the purposes of his business—all the places of public entertainment, and often being a regular attendant at church and the more elegant chapels, especially during charity sermons. The Mobsman takes his name from the gregarious habits of the class to which he belongs, it being necessary, for the successful picking of pockets, that the work be done in small gangs or mobs, so as to "cover" the operator. Among the Sneaksmen, again, the purloiners of animals, such as the horse stealers, the sheep stealers, the deer stealers, and the poachers, all belong to a particular tribe (with the exception of the dog stealers)—they are agricultural thieves; whereas the others are generally of a more civic character. The Shofulmen, or coiners, moreover constitute a distinct species, and upon them, like the others, is impressed the stamp of the peculiar line of roguery they may chance to follow as a means of subsistence.

Such are the more salient features of that portion of the voluntary non-workers who live by *taking* what they want from others. The other moiety of the same class who live by getting what they want *given* to them, is equally peculiar. These consist of the "Flatcatchers," the "Hunter" and "Charley* Pitchers," the "Bouncers" and "Besters," the "Cadgers," the Vagrants, and the Prostitutes.

The "*Flatcatchers*" obtain what they want by false pretences; as swindlers, duffers, ring droppers, and cheats of all kinds.

The "*Hunter*" and "*Charley Pitchers*" obtain what they want by gaming; as thimblerig men, &c.

The "*Bouncers*" and "*Besters*" obtain what they want by betting, intimidating, or talking people out of their property.

The "*Cadgers*" obtain what they want by begging, and exciting false sympathy.

The *Vagrants* obtain what they want by declaring on the casual ward of the parish workhouse.

The *Prostitutes* obtain what they want by the performance of an immoral act.

Each of these, again, are unmistakeably distinguished from the rest. The "Flatcatchers" are generally remarkable for great shrewdness, especially in the knowledge of human character and ingenuity in designing and carrying out their several schemes. The "Charley Pitchers" appertain more to the conjuring or sleight-of-hand and blackleg class. The "Cadgers," again, are to the class of cheats what the "Sneaksmen" are to the thieves, the lowest of all, being the least distinguished for those characteristics which mark the other members of the same body. As the "Sneaksmen" are the least daring and expert of all the thieves, so are the "Cadgers" the least intellectual and cunning of all the cheats. A "shallow cove," that is to say, one who exhibits himself half naked in the streets as a means of obtaining his living, is looked upon as the most despicable of all, since the act requires neither courage, intellect, nor dexterity for the execution of it. The Vagrants, on the other hand, are the wanderers—the English Bedouins—those who, in their own words, "love to shake a free leg"—the thoughtless and the careless vagabonds of our race; while the Prostitutes, as a body, are the shameless among our women.

Such, then, are the characters of the voluntary non-workers, or professionally criminal class, the vagrants, beggars, cheats, thieves, and prostitutes — each order expressing some different mode of existence adopted by those who object to labour for their living. The vagrants, who love a roving life, exist principally by declaring on the parish funds for the time being; the beggars, as deficient in courage and intellect as in pride, prefer to live by soliciting alms of the public; the cheats, possessed of considerable cunning and ingenuity, choose rather to subsist by continual fraud and deception; the thieves, distinguished generally by a hardihood and comparative disregard of danger, find greater delight in risking their liberty by taking what they want, instead of waiting to have it given them; while the prostitutes, as deficient in shame as the beggars are in pride, prefer to live by using their charms for the vilest of purposes.

The exposition of the *causes* why the several species of voluntary non-workers object to labour for their living, I shall reserve for a future occasion; that they do *object* to work is patent in the fact that they might sustain themselves by their industry if they chose (for those who are unable to do so,

* A Charley Pitcher seems to be one who pitches to the *Ceorla*, or countryman, and hence is equivalent to the term *Yokel*-hunter.

and are consequently driven to dishonesty, have been purposely removed from the class).

The number of individuals belonging to the professional criminal class, we are not yet in a position to ascertain; but few dependable facts have been collected on the subject, and even these have been obtained so many years back that, with the increase of population, they have become almost worthless, except in a historic point of view. Such as they are, however, it will be as well to add them to this introduction to the class of voluntary non-workers, as the best information at present existing upon the subject.

TABLE SHOWING THE NUMBER OF DEPREDATORS, OFFENDERS, AND SUSPECTED PERSONS WHO HAVE BEEN BROUGHT WITHIN THE COGNIZANCE OF THE POLICE IN THE YEAR 1837, COMPREHENDING:—

1. Persons who have no visible means of subsistence, and who are believed to live wholly by violation of the law, as by habitual depredation, by fraud, by prostitution, &c.

2. Persons following some ostensible and legal occupation, but who are known to have committed an offence, and are believed to augment their gains by habitual or occasional violation of the law.

3. Persons not known to have committed any offences, but known as associates of the above classes, and otherwise deemed to be suspicious characters.

The estimate made for five of the principal provincial towns in the same year was as follows:—

TABLE SHOWING THE NUMBER OF DEPREDATORS, OFFENDERS, AND SUSPECTED PERSONS BROUGHT WITHIN THE COGNIZANCE OF THE POLICE OF THE UNDERMENTIONED DISTRICTS, IN THE YEAR 1837.

District or Place.	Number of Depredators, Offenders, and Suspected Persons.				Average Length of Career.	Proportion of known bad Characters to the Population.
	1st Class.	2nd Class.	3rd Class.	Total.		
Metropolitan Police District	10,444	4353	2104	16,901	4 yrs.	1 in 89
Borough of Liverpool	3,580	916	215	4,711	......	1 in 45
City and County of Bristol	1,935	1190	356	3,481	......	1 in 31
City of Bath	284	470	847	1,601	......	1 in 37
Town and County of Newcastle-on-Tyne	1,730	222	62	2,014	2¼ yrs.	1 in 27
Total	17,973	7151	3584	28,708		

By the above table it will be seen that, in 1837, there were 28,708 persons of known bad character, infesting five of the principal towns in England: nearly 18,000 of the entire number had no visible means of subsistence, and were believed to live wholly by depredation; 7000 were believed to augment their gains by habitual or occasional violation of the law; and 3500 were known to be associates of the others, and otherwise deemed suspicious characters. According to the average proportion of these persons to the population, there would have been in the other large towns nearly 32,000 persons of a similar class, and upwards of 69,000 of such persons dispersed throughout the rest of the country. Adding these together, we have as many as 130,000 individuals of known bad character in England and Wales, *without* the walls of the prisons.

To form an accurate notion of the total number of the criminal population at the above period, we must add to the preceding amount the number of persons resident *within* the walls of the prisons. These, at the time of taking the last census, amounted to 19,888, which, added to the 130,000 above enumerated, gives within a fraction of 150,000 individuals for the entire criminal population of the country, as known to the police in 1837.

Let us now, for a moment, turn our attention to the number and cost of the honest and dishonest poor throughout England and Wales. Mr. Porter, usually no mean authority upon all matters of a statistical nature, tells us, in his "Progress of the Nation," p. 530, that "the proportion of persons in the United Kingdom who pass their time without applying to any gainful occupation is quite *inconsiderable!* Of 5,800,000 males of 20 years and upwards living at the time of the census of 1831, there were said to be engaged in some calling or profession 5,450,000, thus leaving unemployed only 350,000, or rather less than six per cent." "The number of unemployed adult males in Great Britain in 1841," he afterwards informs us, "was only 274,000 and odd."

But this statement gives us no accurate idea of the number of persons subsisting by charity or crime, for the author of the "Progress of the Nation," strange to say, wholly excludes from his calculation the mass of individuals maintained by the several parishes, as well as the criminals, almspeople, and lunatics throughout the country! Now, according to the Report of the Poor-law Commissioners, the number of paupers receiving in and out-door relief, in 1848, was no less than 1,870,000 and odd. The number of criminals and suspicious characters throughout the country, in 1837, we have seen, was 150,000. In 1844 the number of lunatics in county asylums was 4000 and odd; while, according to the occupation abstract of the population returns there were in 1841 upwards of 5000 almspeople, 1000 beggars, and 21,000 pensioners. These, formed into one sum, give us no less than 2,000,000 of individuals living upon the income of the remainder of the population. By the above computation, therefore, we see that, out of a total of 16,000,000 souls, in England and Wales, one-eighth, or twelve per cent. of the whole, continue their existence either by pauperism, mendicancy, or crime.

Now, the cost of this immense mass of vice and want is even more appalling than the number of individuals subsisting in such utter degradation. The total amount

of money levied in 1848 for the relief of the poor throughout England and Wales, was 7,400,000*l.* But, exclusive of this amount, the magnitude of the sum that we give voluntarily towards the support and education of the poorer classes, is unparalleled in the history of any other nation, or of any other time. According to the summary of the returns annexed to the voluminous reports of the Charity Commissioners, the rent of the land and other fixed property, together with the interest of the money left for charitable purposes in England and Wales, amounts to 1,200,000*l.* a year; and it is believed that, by proper management, this return might be increased to an annual income of at least two millions of money. "And yet," says Mr. M'Culloch, "there can be no doubt that even this large sum falls far below the amount expended every year in voluntary donations to charitable establishments. Nor can any estimate be formed," he adds, "of the money given in charity to individuals, but in the aggregate it cannot fail to amount to an immense sum." All things considered, therefore, we cannot be very far from the truth, if we assume the sums *voluntarily* subscribed towards the relief of the poor to equal, in the aggregate, the total amount raised by assessment for the same purpose (the income from voluntary subscriptions to the *metropolitan* charities alone equals 1,000,000*l.* and odd); so that it would appear that the well-to-do amongst us expend the vast sum of 15,000,000*l.* per annum in mitigating the miseries of their less fortunate brethren.

But though it may be said that we give altogether 15,000,000*l.* a year to alleviate the distress of those who want or suffer, we must remember that this vast sum expresses not only the liberal extent of our sympathy, but likewise the fearful amount of want and suffering, on the one hand, and of excess and luxury on the other, that there must be in the land. If the poorer classes require fifteen millions to be added in charity every year to their aggregate income in order to relieve their pains and privations, and the richer can afford to have the same immense sum taken from theirs, and yet scarcely feel the loss, it shows at once how much the one class must have in excess and the other in deficiency. Whether such a state of things is a necessary evil connected with the distribution of wealth, this is not the place for me to argue. All I have to do here is to draw attention to the fact. It is for others to lay bare the cause, and, if possible, discover the remedy.

There still remains, however, to be added to the sum expended in voluntary or compulsory relief of the poor, the cost of our criminal and convict establishments at home and abroad. This, according to the Government estimates, amounts to very nearly 1,000,000*l.*; then there is the value of the property appropriated by the 150,000 habitual criminals, and this, at 10*s.* a week per head, amounts to very nearly 4,000,000*l.*; so that, adding these items to the sum before-mentioned, we have, in round numbers, the enormous amount of 20,000,000*l.* per annum as the cost of the paupers and criminals of this country; and, reckoning the national income, with Mr. M'Culloch and others, at 350,000,000*l.*, it follows that the country has to give upwards of five per cent. out of its gross earnings every year to support those who are either incapable or unwilling to obtain a living for themselves.

OF THE PROSTITUTE CLASS GENERALLY.

We have now seen that the two modes of obtaining a living other than by working for it are, by forcibly or stealthily appropriating the proceeds of another's labour, or else by seducing the more industrious or thrifty to part with a portion of their gains. Prostitution, professionally resorted to, belongs to the latter class, and consists, when adopted as a means of subsistence without labour, in inducing others, by the performance of some immoral act, to render up a portion of their possessions. Literally construed, prostitution is the putting of anything to a vile use; in this sense perjury is a species of prostitution, being an unworthy use of the faculty of speech; so, again, bribery is a prostitution of the right of voting; while prostitution, specially so called, is the using of her charms by a woman for immoral purposes. This, of course, may be done either from mercenary or voluptuous motives; be the cause, however, what it may, the act remains the same, and consists in the base perversion of a woman's charms—the surrendering of her virtue to criminal indulgence. Prostitution has been defined to be the illicit intercourse of the sexes; but illicit is unlicensed, and the mere sanctioning of an immoral act could not dignify it into a

moral one. Such a definition would make the criminality of the act to consist solely in the absence of the priest's licence.

In Persia there are no professional prostitutes permitted; but though the priest's sanction there precedes the surrendering of the woman's virtue in every instance, still the same immoral perversion takes place—it being customary for couples to be wedded for a small sum by the priest in the evening, and divorced by him, for an equally small sum, in the morning. Here, then, we find the licensed intercourse assuming the same immoral cast as the unlicensed; for surely none will maintain that these nuptial ephemeræ are sanctified, because accompanied with a priestly licence. Nor can we, on the other hand, assert that the mere fact of continence in the association of the sexes, the persistence of the female to one male, or the continued endurance of an unsanctioned attachment, can ever be raised into anything purer than cohabitation, or the chastity of unchastity.

Prostitution, then, does not consist solely in promiscuous intercourse, for she who confines her favours to one may still be a prostitute; nor does it consist in illicit or unsanctioned intercourse, for, as we have seen, the intercourse may be sanctioned and still be prostitution to all intents and purposes. Nor can it be said to consist solely in the mercenary motives so often prompting to the commission of the act; for fornication is expressly that form of prostitution which is the result of illicit attachment.

In what, then, it may be asked, *does* prostitution consist? It consists, I answer, in what the word literally expresses—putting a woman's charms to vile uses. The term *whore* has, strictly, the same signification as that of *prostitute;* though usually supposed to be from the Saxon verb *hyrian,* to hire, and, consequently, to mean a woman whose favours can be procured for a reward. But the Saxon substantive *hure,* is the same word as the first syllable of *hor-cwen,* which signifies literally a filthy quean, a *har*-lot. Now the term *hor,* in *hor-cwen,* is but another form of the Saxon adjective *horig,* filthy, dirty, the Latin equivalent of which is *sor*-didus; hence the substantive *horines* means filthiness, and *horingas,* adulterers (or filthy people), and *hornung,* adultery, fornication, whoredom (or filthy acts). Prostitution and whoredom, then, have both the same meaning, viz., perversion to vile or *filthy* uses; and consist in the surrendering of a woman's virtue in a manner that excites *our moral disgust.* The offensiveness of the act of unchastity to the moral taste or sense constitutes the very essence of prostitution; and it is this moral offensiveness which often makes the licensed intercourse of the sexes, as in the marriage of a young girl to an old man, for the sake of his money, as much an act of prostitution as even the grossest libertinism.

The next question consequently becomes, what are the invariable antecedents which excite the moral disgust in every act of prostitution? or are there any such invariable antecedents characterizing each offensive perversion of a woman's charms? Is the offensiveness a mere matter of taste, differing according as the moral palates of the individuals or races may differ one from the other, and ultimately referable to some peculiar form of organization, convention, fashion, or geography? or is it a part of the inherent constitution of things?—in a word, is there an abstract chastity and unchastity; an erotic τὸ καλὸν and τὸ κακὸν; an universal standard of moral beauty and ugliness in woman—that, go where you will, is the same to all natures and in all countries? or is the vice of one set of people the virtue of another, as this race admires white teeth and that black?

This is a matter lying, as it were, across the very threshold of the subject, and which must necessarily, according as one or other view be taken, give a wholly different cast, not only to all our thoughts in connection with the evil, but to all our plans for the remedy of it. If prostitution be loathsome to us, merely because it is the moral fashion of our people that it should be so, then by popularizing new forms of thought and feeling among us may we remove all opprobrium from the act, and so put an end to all the moral evil in connection with it; but if it be naturally and innately offensive to every healthy mind, then can it be remedied solely by improving the tone of the thoughts and feelings of the depraved, and restoring the lost moral sense, as well as directing the perverted taste to more wholesome and beautiful objects.

To solve this part of the problem, then, it will be necessary that we should take as comprehensive a view of the subject as possible, collecting a large and multifarious body of facts, and examining the matter from almost every conceivable point of view. It will be necessary that we should regard it by the light of the early ages of society—that we should contemplate it

amid all the primitive rudeness of barbaric life—and ultimately that we should study it under the many varied phases that it assumes in civilized communities.

For the better performance of this task I have availed myself of the services and assistance of my friend, Mr. Horace St. John, whom I shall now leave to lay before the reader the many curious and interesting facts which he has collected at my request in connection with the ancient and foreign part of the subject, after which I shall return to the consideration of that branch of the general inquiry connected more immediately with the prostitution of this country.

Of Prostitution in Ancient States: General View.

In the following inquiry, though the chief object will be to ascertain the extent and character of the prostitute class of women, it will be necessary to indicate generally the condition of the sex in various ages, and among different nations. This will afford a comparative view of the subject. It is impossible to form a judgment on the condition of this class, and its influence on society, without learning in what degree of estimation morality is viewed by a people; what position in the social scale is occupied by their women; at what price chastity is held; and what are the relative stations of the sexes. To afford a correct idea of this, in plain, popular language, is the task to which we now apply ourselves; and we commence with the ancient states whose institutions have, in a greater or less degree, influenced those of all others, in every later age. It is necessary to maintain a distinction between those countries where marriage was an institution, and those—if they are not quite fabulous—at least savage communities where the intercourse of men with women is looser than that of beasts.

Far as we can trace the history of society we discover no state without the blemish of prostitution. In some it was more, in others less prevalent; but in all it existed in one form or another. In examining the manners of the ancient nations, Hebrews, Egyptians, Greeks, Romans, Celts, and Anglo Saxons, we find women who degraded themselves from vanity, lust, or for gain; and, among the old communities of the East, less known to us, public immorality was a characteristic. We shall show this to have been the case, and, basing our statements on the most creditable authority, indicate the principal features of each system. The information, it is true, which has been bequeathed to us, and elucidated by the learning and diligence of numerous scholars, is far from complete; but enough may be collected among the antiquities of Israel, Greece, Rome, and Egypt, to establish a fair opinion. The general design of this inquiry will be to draw a view of the position occupied by the female sex in different ages and countries, to measure the estimation in which it was held, to fix the accepted standard of morality, to ascertain the recognised significance of the marriage contract, the laws relating to polygamy and concubinage, the value at which feminine virtue and modesty were held, and thus to consider the prostitute in relation to the system of which she formed a part. *She* will be the particular object of investigation; but the others are by no means unimportant. They are, indeed, necessary to a just and comprehensive view of the question before us. In a society where men lived in brutal promiscuousness with the women, prostitution could scarcely exist; where chastity was lightly esteemed, and marriage held to be a loose contract for social purposes, adultery could hardly be very full of shame. In this, therefore, as in all other inquiries, it is necessary to view the actual object in relation to others which are invariably connected with it. There is no universal, unvarying standard, by which even prostitution can be measured. Circumstances, not belonging, yet not entirely foreign to it, are to be considered. Consequently, while we hold that in view as the main ground of research, we shall, where materials allow, draw a sketch of the situation occupied by the female sex, and of the other traits of civilization to which we have referred.

In a general view, Greece and Rome, with the great city of Babylon, stand most prominently forward with their system of prostitution. Closer inquiry, however, induces us to hesitate before assigning them that distinction. Of the two classical states especially, it is because our information is more immediate and complete, that their public immorality is more remarkable. The poets of the earlier, and the historians of the later, period, have transmitted to us numerous accounts of the manners and customs of Greece and Rome; their painters have left us views,—their architects and sculptors, monuments of their civilization. Their moralists and satirists have enlarged on the prevalent vices, and from all these sources we are enabled to derive clearer ideas of their women, and especially their prostitution. Besides, in a polished state, with pure manners the prostitute class will

always be more distinct, and therefore more conspicuous.

Babylon, far more than a thousand years ago, was a proverb of immorality. Her name and the name of Whore have been associated ideas, not on account only of the idolatry practised by her people, but on account of their licentious manners. Concerning Egypt, though Diodorus and Herodotus wrote of it, little is known; of the marriage ceremony absolutely nothing. The prostitutes are not described; but, from every trace and record of their civilization which has been preserved, it is evident that a large class addicted itself to this calling. Who were the public musicians, disreputable in the eyes of all other persons?—who were the dancers who performed their wanton feats at the entertainments of the rich, and stripped themselves half, or entirely, naked before their couches?—who were the drunken women, who bared their bodies, and capered in that state on the Nile boats, during the festival of Bubastis?—who were they who assisted at the sacerdotal orgies, which defiled the temples of ancient Egypt? —who could they have been, but women of abandoned character, who prostituted themselves for vile purposes, for gain or pleasure?

Among the Jews, again, the continually reiterated allusions to harlots, in the Scriptures, the abominations perpetually charged to their account, the threats pronounced upon their wickedness, the frequent allusions to their licentious manners, indicate a wide prevalence of this system. Among a people so commonly guilty of nameless crimes, we cannot expect to find chastity a peculiar virtue. Indeed, it is seldom such vices are practised until all the inferior offences against decency have become insipid through satiety. The writers, therefore, who parade before us the civilization of the Jews, as an example of public morality, base their conclusions on a strange interpretation of facts. To contrast them with the manners of Attic Greece, is a pure satire on common sense. Sparta was licentious, but not in the low and gross manner of the Jews. Athens harboured a licentious class; but none like those bestial voluptuaries among the Hebrews, in whom lust became a loathsome passion. Although, therefore, the actual manners of ancient Israel have been less vividly described than those of Greece, it is evident from the tenour of Scripture history, that morality there was less pure than in the Attic state.

Rome, under the republic, was, perhaps, still farther removed from the charge of corruption. Prostitutes it had, and brothels; but its women were generally virtuous. The chastity of the Roman matron has passed into a proverb. It was, however, if we may credit the historian Tacitus, exceeded by the modesty of the women in ancient Germany. Among them morals appear purged of licentiousness. Polygamy was forbidden, and practised only by the petty kings who set themselves above the law. The manners of the people, rather than the enactments of their code, prohibited divorce. Adultery, rare as it was, ranked as an inexpiable crime; while seduction was condemned, and prostitution unknown. It was not, however, the severity of the law which enforced the virtue; it was the virtue that imparted its spirit to the law. From the morals of ancient Germany, the lawgivers of society might learn many useful lessons. Bars and bolts, multiplied walls, troops of eunuchs, jealous lattices, and the dread of punishment, failed to guard the harems of the East; while the hut of the German barbarian, open on all sides, was impregnable against the seducer. The poor toy of the Persian's seraglio, protected by a hundred devices, often eluded them all; but the German women were the guardians of their own honour. They may be described as possessing all the virtues, without the vices, of the stern Spartan stock; and, living on terms of equality with the men, held their virtue at too dear a price to prostitute it for admiration, or lust, or money. Civilization, in this respect, has done the Germans a very ill office.

Allied to these fierce wanderers in the Hyrcynian wood were the Saxons, from whom our ancestors descended. We shall find among them, on their native soil, similar manners, especially in the circumstance of the adulteress being whipped without mercy through the village. Among them prevailed, however, an enlightened reverence for the female sex, which contrasted strongly with the ideas of many surrounding nations, who looked on a woman as a creature merely dedicated to the service and gratification of man. They brought over to England institutions susceptible of being moulded to a different form. They became more refined and less moral. Whenever, indeed, rude men, who have not given themselves up to the indulgence of their low physical appetites, turn from the chase, from war, and similar rough occupations, to the framing of laws, to the formation of society, to any intellectual exercise, it appears natural that other propensities should be awakened in them, and of these the sensual always form a part. It is, consequently, interesting to

study the progress of manners from stage to stage of civilization, from the rudest tribe to the most refined community.

We shall occupy ourselves first with the Hebrew republic, and then with the monarchy which succeeded it. From Israel we proceed to Egypt, related to it in various ways. Thence our attention will be directed to Greece, which offered models to the statesmen and public economists of all time. The contrast between the Ionic and the Doric states will be presented. Then we shall proceed to Rome, which will lead us to the Anglo-Saxons, others being incidentally noticed by the way.

In all, as far as our limits and our materials will allow, a sketch of the condition of women, the national ideas of feminine virtue, the laws of marriage, and the extent of prostitution, will be given; and thus the reader will be prepared to enter on the wider field of modern society abroad. This will be divided into the barbarous and the civilized; and of the barbarous, the hunters, fishers, shepherds, and tillers of the soil, may be separately noticed.

The account of every ancient people will not be equally complete, because the sources of information are not so. Thus of Egypt, its marriage-customs are wholly unknown; of the Anglo-Saxons, although the learning and industry of Sharon Turner have been employed upon them, our knowledge is extremely imperfect. Even Rome and Greece, though they present us with the general features of their social systems, disappoint us when we search into details. Nevertheless, the reader may be enabled, as we have before said, to form a just idea of the condition of women in antiquity; for the researches of modern scholars have succeeded, at least, in laying bare the principal roots of the ancient system, upon which all the institutions of existing society are, in one form or another, established.

Of Prostitution among the Jews and other Ancient Nations.

A slight and rapid view of the subject in connection with the Jews, and more obscure nations of antiquity, is all that can here be attempted. With reference to the republic of the Hebrew race, though the ingenuity of modern writers has built up very pleasing theories, described as the manners and customs of the Jews, we can look nowhere for information except to the Bible, and, in a later age, to Josephus.

The position of woman among the Jews was by no means exalted. She was seldom consulted by her friends, when an union with her was desired by a wealthy suitor. Indeed, in the patriarchal times she was regarded more as her husband's property than as his companion. Such must invariably be the case where polygamy and concubinage are institutions of society. At a still earlier period the customs of society were even more at variance with our ideas. Of course the sons of Adam must have married their sisters, and the practice continued after the necessity for it had ceased. Abraham formed such an union without exciting surprise. The patriarchs permitted men to wed two sisters at once, but the law of Moses brought a reform of marriage customs among the Jews *. They discontinued the intercourse between blood-relatives long before it was abandoned by the surrounding nations. Marriages with sisters not by the same mother were forbidden in the Mosaic code. Previously, however, none were unlawful except those of a man with his mother, or mother-in-law, or full sister. In the new dispensation the widow of a deceased brother was placed within the prohibited degree of consanguinity.

The laws against adultery were severe; death was ordained for both the guilty persons, and the punishment appears always to have been by stoning. Many victims, doubtless, perished under this cruel code; but the example of Jesus Christ gave a new lesson to mankind. The woman was brought before him, and the Jews claimed her condemnation. They asked him "should she be stoned." Had he said no, they might have charged him with favouring adultery, and denying the Mosaic law; had he said yes, the Romans might have impeached him, for they had assumed the distribution of justice, and abolished the punishment of death for adultery. But he evaded their malice, and gave the law of mercy. "Let him that is without sin among you cast the first stone." They all went out, and when he was alone with her he said, "Hath no man condemned thee?" She answered, "No man, Lord." And he again said, "*Neither do I condemn thee—go, and sin no more.*"

That sentence should ever be in remembrance when we frame our moral code.

* The marriage institution is mentioned early in Genesis vi. 1, 2, "And it came to pass, when men began to multiply on the face of the earth, and daughters were born unto them,

"That the sons of God saw the daughters of men that they were fair; and they took them wives of all which they chose."

Adultery, however, was a crime only to be committed with a married woman, or one who was betrothed. The man's marriage placed him under no obligation to abstain from intercourse with other than his wife. Wives to the number of four were allowed, while concubinage was unlimited. The first wife, however, was superior to the others. Jealousy, therefore, among the Jewish women could not have been a powerful feeling. Indeed we find strong proofs to the contrary. When Sarah found herself barren, she gave Hagar, her Egyptian maid, to Abraham, as a concubine or inferior wife. Other women, frequently, on discovering themselves to be sterile, begged their husbands to procure another companion of the bed, that they might not die childless. Similar instances are common in the social history of the East.

Marriage with an idolater was forbidden; but a man might marry a proselyte captive. When he saw a beautiful woman among his prisoners of war, he was to take her home, shave her head, pare her nails, change her raiment into that of a free person, and as he had *humbled* her, was forbidden to make merchandise of her again. The possession, nevertheless, of two wives by a private individual was a rare thing. Popular feeling was generally averse to it. The personages who most commonly practised it were the great men and kings, who were most expressly prohibited. In the Book of Deuteronomy, when the degraded Israelites had clamoured for a king, the law was given, "Neither shall he multiply wives to himself, so that his heart turn not away." No command was more frequently broken in the palaces of Israel. David had an immense harem; it seemed to be reckoned among the regalia. Solomon, who married Pharaoh's daughter, had seven hundred wives — princesses — and three hundred concubines; but we find that he "did evil in the sight of the Lord," and that "his heart was turned away."

Respecting the children born to these parents there was a change in the law. In *Genesis* a man was allowed to transfer the inheritance to a favourite child; but, probably from the many flagitious actions committed, it was in Deuteronomy ordained, that if a man had two wives, of whom he hated one and loved the other—each bearing a child, the first-born, whether of the loved or the hated woman, should enjoy the right of inheritance.

From all the passages in Scripture referring to this subject, it appears that women among the Jews held but an indifferent position, being made the subject of barter, and that marriage was not a sacred but a civil institution,—a legal bond, which might be broken by a legal act. Matches were usually made by the woman's kindred, she herself being a secondary actor in the transaction.

Throughout the Bible, notwithstanding, we find women held by the inspired writers in great respect, their treatment by the rebellious Jews, as they sank through various degrees of corruption, being continually set forth among the abominations practised by that flagitious people.

In the Scriptures we discover innumerable references to women, and to prostitutes in particular; but, collecting and comparing them all, we find for our present purpose materials by no means abundant: there is no exact information. Prostitutes, we know, existed, and we are told in what estimation they were held; that they stood at the corners of streets, that they practised many seductive arts, and sold themselves at a very cheap rate: but how many they were, how they lived, what was the nature of their places of resort, we are left uninformed, or guided only by obscure allusions. Nevertheless, sufficient is known upon which to base a view of the condition of women, and the extent of morality among the most ancient nation recognised in history.

In the book of Genesis, whence we obtain our first glimpses of the social history of mankind, we find interesting, though imperfect, sketches of a curious state of society. We meet, even so early as this, with a woman wearing a veil, not taking her meals in company with men, living in separate apartments, and presenting a model of the system still prevalent in the East. Simplicity and luxury in strange combination characterized the manners of that remote age. Their morals appear to have been at all times gross; and one of the principal tasks of legislation was to restrain the licentiousness to which the people were so prone to abandon themselves. Many barbarous races present at this day social institutions similar to those of the Jews, whence many writers have traced them to that stock. It is more probable, however, that similar manners grow out of a similar condition.

Several writers, we know, contend for the purity of manners among the Jews, and point to the rigid laws which ruled them. The social history of mankind, however, if it proves anything, proves this, that it is not by any means the nation with the severest code which is the most

virtuous. Examples of the contrary might be multiplied. No state, savage or civilized, could ever have more rigorous laws than Achin and Japan, and nowhere have the people been more flagitious. While the Draconic code was in force, morals in Greece went to rot. Consequently, if we are to consider the Jews to have been a moral people, it must certainly not be on the ground of their severe laws. Arguing from that, a contrary inference should be drawn. The direct evidence, however, tends the other way. Chastity appears to have been by no means a favourite virtue. Not to allude to the unnatural abominations mentioned in the Bible, it is certain that there existed a considerable class of public women, who prostituted themselves to any one for a certain reward.

The story of Tamar is a curious illustration of this subject. To impose on Judah, and bear a child by him, and in spite of him, she assumes the habit and appearance of a regular prostitute. She then goes out, and sitting down by the highway covers her face. Judah thought her to be a harlot, "because she covered her face," which, as the commentators tell us, it was the custom for such women to do, as among the same class of females in Persia, in mimicry of a shame they did not feel. Judah speaks to her, and says, "Go to, I pray thee, let me come in unto thee." She answers, "What wilt thou give me, that thou mayest come in unto me?" He promises to give her a kid from his flock, but she demands a pledge; this he gave, and went with her.

The circumstance is related in a manner which seems to show that the practice was common with men, nor does any particular disgrace appear to attach to it. When, however, Judah learns that his daughter-in-law Tamar is "with child by whoredom," he condemns her to the punishment of death by burning, on the secret being at length revealed to him *. We have here a singular illustration of manners among the primitive tribes of that great family of mankind. The corruption of manners reached, it is probable, a high degree before the laws were given.

Where concubinage was practised, feminine virtue could not be held as a precious possession. The intercourse accordingly of a married man with an unmarried woman was esteemed simply as a proof of deficient chastity. At the same time, the encouragement of prostitution, or "the feeding of whores," is denounced as the conduct of foolish and profligate men, who unwisely waste their substance. The

* The passage here alluded to is as follows:—

"Then said Judah to Tamar his daughter in law, Remain a widow at thy father's house, till Shelah my son be grown: for he said, Lest peradventure he die also, as his brethren did. And Tamar went and dwelt in her father's house.

"And in process of time the daughter of Shuah Judah's wife died; and Judah was comforted, and went up unto his sheepshearers to Timnath, he and his friend Hirah the Adullamite.

"And it was told Tamar, saying, Behold thy father in law goeth up to Timnath to shear his sheep.

"And she put her widow's garments off from her, and covered her with a vail, and wrapped herself, and sat in an open place, which is by the way to Timnath; for she saw that Shelah was grown, and she was not given unto him to wife.

"When Judah saw her, he thought her to be an harlot; because she had covered her face.

"And he turned unto her by the way, and said, Go to, I pray thee, let me come in unto thee; (for he knew not that she was his daughter in law.) And she said, What wilt thou give me, that thou mayest come in unto me?

"And he said, I will send thee a kid from the flock. And she said, Wilt thou give me a pledge, till thou send it?

"And he said, What pledge shall I give thee? And she said, Thy signet, and thy bracelets, and thy staff that is thine hand. And he gave it her and came in unto her, and she conceived by him.

"And she arose, and went away, and laid by her vail from her, and put on the garments of her widowhood.

"And Judah sent the kid by the hand of his friend the Adullamite, to receive his pledge from the woman's hand: but he found her not.

"Then he asked the men of that place, saying, Where is the harlot, that was openly by the way side? And they said, There was no harlot in this place.

"And he returned to Judah, and said, I cannot find her; and also the men of the place said, that there was no harlot in this place.

"And Judah said, Let her take it to her, lest we be shamed: behold, I sent this kid, and thou hast not found her.

"And it came to pass about three months after, that it was told Judah, saying, Tamar thy daughter in law hath played the harlot; and also, behold, she is with child by whoredom. And Judah said, Bring her forth, and let her be burnt.

"When she was brought forth, she sent to her father in law, saying, By the man, whose these are, am I with child: and she said, Discern, I pray thee, whose are these, the signet, and bracelets, and staff.

"And Judah acknowledged them, and said, She hath been more righteous than I; because that I gave her not to Shelah my son. And he knew her again no more."—Gen. xxxviii. 11–26.

class of prostitutes was held in very low esteem; they were, in general, foreigners and heathens, and are spoken of usually as "strange women." Delilah, who beguiled Sampson, was probably a Philistine, though it is not certain that she was not an Israelite. At any rate, there appear to have been many Jewish women, of the lowest order, who followed this degrading occupation. To render them as few as possible, a law was passed forbidding men, under severe penalties, from bringing up their daughters to prostitution for gain. Legislation, however, could not entirely restrain the vicious from such a course of life.

Apparently the prostitutes, among the Jews, sometimes obtained husbands. Priests, however, were forbidden on any account to marry a harlot, or indeed any woman with even a breath of imputation on her fame. For the daughter of a priest, who took to the calling of a prostitute, the punishment was death by burning. For any woman it was infamous, but in spite of what was laid down in the law, or by the public opinion of the Jews, cities never wanted prostitutes, and women walked the streets, or stood in groups at the corners, ready to entrap the young men who came forth in quest of pleasure. Among the exhortations of parents to their sons, and of patriarchs to youth, we always find an injunction to beware of strange women, which implies a considerable prevalence of the system. The readers of the Bible will at once remember the many passages of this kind contained in that volume*.

With respect to prostitution among the Jews, an illustration is afforded by the story of the two mothers who came before Solomon for judgment. They were *harlots*, though bearing children, and they said they dwelt in one house, and "there was no stranger with us in the house." Another is afforded by the account of the two men whom Joshua sent out as spies. They came into a harlot's house at Rabbah—a brothel, in fact, where, as at Rome in the Imperial age, the woman sat impudently, without a veil, at the door, and solicited the passers by. They wore peculiar clothing. In addition to the vile customs of the East, we find, "Thou shalt not bring into the temple the price of a whore." This was to guard against the introduction of a practice not uncommon among some ancient and modern nations, of the priests enriching themselves and their temple by hiring out prostitutes *.

Another state, known to us from Scripture, is Babylon, surnamed the Whore, as well from its profligacy as its idolatry. The one, indeed, was accompanied by the other. Luxury and debauch were carried to the highest excess. The Temple of Venus,—a goddess known there as Mylitta,—was sacred to prostitution. The priests had, in immemorial time, invented a law that every woman should once in her life present herself at the temple, and prostitute her body to any stranger who might desire it. Consecrated by religion, this act appeared odious to few of the Babylonian citizens. The woman came, dressed brilliantly, and crowned with a garland of flowers; she sat down with her companions in a place where the strangers who filled the galleries might observe and make choice of their victims. Numbers were found always ready enough to enjoy the privilege procured for them by the priests. When a man had selected one of the women who pleased him most, he came down, and making her a present of money, which she was compelled to take, took her hand and said, "I implore in thy favour the goddess Mylitta!" He then led her to a retired spot and consummated the transaction. Having once entered the temple it was impossible for any ordinary woman to return home without having prostituted herself. Nevertheless, the priests allowed some ladies of rank and wealth to make a bargain for their chastity, which they probably desired to dispose of more agreeably to their own caprice. These few privileged persons went through the ceremonies without performing the usual act of prostitution. At the taking of Babylon by Cyrus, men were found ready to hire out their daughters and prostitute them for profit, while in the Alexandrian age men sent their wives to strangers for a sum of money †.

Throughout the countries of the East, upon the history of which at that early period any light has been thrown, we discover the prevalence of similar customs. The most celebrated appear the most licentious, but probably only because they have

* All this is based on the authority of the Bible. Elucidations also have been afforded by "The Book of the Religion &c., of the Jews," from the Hebrew, by Gamaliel ben Peldahzur; "The Laws and Polity of the Jews," Sigonius, "Republica Hebræorum;" and the various commentators.

* Mary Magdalene, of Magdala, was not the sinner, the woman of the city, who washed the feet of Jesus. She appears to have been a reputable person, while the other had been a prostitute. What a lesson is read to us by Christ's behaviour to her!

† See Goguet, "Origine des Loix," with Herodotus, Strabo, and Quintus Curtius.

been the most strictly investigated. The wealthy and luxurious capitals, in which the spoils of great conquests were piled up, never failed to supply a sufficient number of abandoned women, supported by the looser sort of men, in various degrees of position, from penury to splendour. Though circumstances of time and place, of religion and civilization, imparted peculiar characteristics to the prostitute class of each age and country, the general features of the system were invariably the same, and the prostitutes of Babylon resembled very much the prostitutes of New Orleans and London. We turn next to ancient Egypt, a country of whose laws and manners we have had interesting, if not complete, accounts bequeathed us.

Of Prostitution in Ancient Egypt.

Turning to ancient Egypt, we find, in the records of that singular people, little directly bearing on the question before us. Herodotus, and Diodorus the Sicilian, are almost the sole lights which guide us in our researches among them. Recently, the labours of a learned antiquarian have tended to increase our acquaintance with the people of old Egypt, by translating into language the volumes of information engraved or painted on the walls of tombs, temples, palaces, and monuments, so numerous in the cities on the banks of the Nile. We have thus had broad glimpses of the ancient history, the geography, population, government, the arts, the industry, and the manners of that country at that period; but the extent of the prostitute system has not been touched upon. Nevertheless, as one of the most ancient civilizations known to history, Egyptian society deserves some attention, and it is worth while to glance at the general condition of its women, especially as a few facts throw light on the especial point of our inquiry.

The position of a woman in ancient Egypt was in some respects remarkable. Entire mistress of the household, she exercised considerable influence over her husband, and was not subjected to any intolerable tyranny. In all countries, however, where concubinage is allowed, the condition of the sex must be in a degree degraded. Herodotus tells us that the Egyptians married only one wife, Diodorus that they married as many as they pleased, the restriction applying only to the sacerdotal order. The contradiction may be reconciled by supposing that the former writer described the general practice, and the latter the permission granted by the law; or, which is more probable, that he confounded concubinage with polygamy. From frequent allusions to this system we know it was tolerated. Wise laws, however, held a check upon the practice. Every child, the fruit of whatever union, was to be reared by its parents, infanticide being severely punished. Illegitimacy was a term not recognised. The son of the free, and the son of the bondwoman, had an equal right to inheritance, the father alone being referred to, since the mother was viewed as little more than a nurse to her own offspring. Women in Egypt bore numerous children, which rendered many concubines a burden too heavy for any but the wealthy to bear; nevertheless, some did indulge themselves in this manner, procuring young girls from the slave-merchants who came from abroad, or captives taken in the field.

In a country where the marriage of brother and sister was allowed, we might expect to find curious laws relating to the subject before us. But they were not curious, in any particular degree. Adultery was punished in the woman by the amputation of her nose, in the man by a thousand blows with a stick. The wealthier men were extremely jealous, forcing their wives to go barefooted, that they might not wander in the streets. Eunuchs, also, were maintained by some. Among classes of a lower grade, the women enjoyed peculiar freedom, being allowed to take part in certain public festivals, on which occasions they wore a transparent veil. Among all sorts and conditions of the sex, the drinking of wine was permitted, as it was by the Greeks, though not by the Romans; and ladies are occasionally represented on the monuments, exhibiting all the evidences of excess.

These observations apply to the respectable female society of ancient Egypt. There existed, however, another class, nowhere indeed indicated under the term harlot, or prostitute, but evidently such from the accounts we have received. If the descriptions transmitted to us of the ordinary female society be correct, the women to whom we allude could have been no other than public prostitutes. Such were, in all probability, those who enlivened the festival of Bubastis, and danced at the private entertainments. What ideas of decency prevailed among them, may be imagined from the brief though curious account afforded by Herodotus. When the time of the festival arrived, men and women embarked promiscuously, and in great numbers, on board the vessels which conveyed them up or down the river. During the

Original from HARVARD UNIVERSITY

voyage, they played on various instruments, and whenever they arrived at a city moored the boats. Then some of the women, who could have been no other than the Almé of those days*, played furiously all kinds of music, flung off their garments, challenged the women of the town with gross insulting language, and outraged decency by their gestures and postures. An immense concourse of people assembled on the occasion, and a large proportion of them belonged to the female sex. "Some of them" only, according to our author, took part in the exhibitions of profligacy we have noticed.

The public dancers and musicians of the female sex were also, in all probability, members of the sisterhood we allude to. They were, it is well known, held in extremely low estimation: they were clothed, like the prostitutes of ancient Greece, in a single light garment; indeed, from the monuments, it is questionable whether they did not, like those in the Roman saturnalia of Flora, dance entirely naked at some of the more dissolute private festivals of the wealthy. At any rate, their forms are represented so completely undraped, that any garment they wore must have been a light veil which clung to the skin, and was transparent. But from what we are told of the festival of Bubastis, it is by no means improbable that they were actually nude.

In that remote period, fancifully called the age of Sesostris, chastity does not appear to have been the capital virtue of society among the Egyptians. At least, we must draw this inference if we are to attach any significance to traditions or fables, which generally reflect some phase of truth. Sesostris, it is said, having offended the gods, was struck blind, and ordered to find a woman who had been strictly faithful to her husband. He was very long in performing the task, being furnished with an unerring rule of judgment. Of course the account is an idle fable, yet it is not altogether unworthy of notice, for it indicates an opinion as to the chastity of that period†.

Of Prostitution in Ancient Greece.

In the heroic ages of Greece, we find women—on the authority, indeed, of poets, the sole historians of those times—enjoying a considerable share of liberty, held in much respect, accustomed to self-reliance, and allowed freely to mingle with others of their own sex and with men. A modest simplicity of manners is ascribed to them, which is wholly foreign to modern ideas of refinement. What education they received is not well known, though they appear to have been trained to practise many of the useful as well as the elegant arts of life; but with respect to the morality prevalent among them little exact information can be gained. As in the Bible, however, frequent allusion is made to harlots and strange women, waiting at the corners of the streets, so in the poets of antiquity, passages occur which point to the existence of a class, dedicating itself to serve, for gain, the passions of men who could not afford marriage, or would not be bound by its restrictions. The science of statistics, however, does not seem to have been cultivated in those days. We are not told with certainty of the population of cities, or even whole countries, and men were not then found to calculate how many in a hundred were immoral, or to compare the prostitute with the honourable classes of women.

With the commencement of the strictly historical age, though statistics are still wanting, there have been collected materials from which we may gather fair ideas of the *status* of women, and the position and extent of the prostitute class among them. Beginning with Sparta, a very peculiar system displays itself. Among the citizens of that celebrated Doric state, women were regarded as little more than agencies for the production of other citizens. The handsome bull-stranglers of Lacedæmon held exceedingly lax notions of morality, and would have considered a delicately chaste woman as one characterized by a singular natural weakness. Taught to consider themselves more in their capacity of citizens than of women, their duty to their husbands, or to their own virtue, occupied always the second place. Their education inculcated the practice of immorality. All ideas of modesty were by a deliberate public training obliterated from their minds. Scourged with the whip when young, taught to wrestle, box, and race naked before assemblages of men, their wantonness and licentiousness passed every bound. Marriage, indeed, was an institution of the state; but no man could call his wife his own. On occasions when the male population was away in the field, the women complained that there was no chance of children being born, and young men were sent back from the camp, to become the husbands of the

whole female population, married and single.

In times of peace, also, the public laws gave every woman a chance of becoming what we should in these days term a public prostitute. A man without a wife might insist on borrowing for a certain time the wife of another. Should her husband resist, the law was called in to enforce the demand. It is asserted, indeed, by some, that adultery was unknown in Sparta. There was no such offence, in truth, recognised in the code. It was common, legal, and occurred every day. At the same time, however, it is to be remembered, that the severe laws of Sparta, recognising no concessions to the weaker passions of men, allowed these things only for state purposes, that citizens might be brought forth. There appears to have been no class of prostitutes gaining a livelihood by selling their persons to the pleasures of men: the rigorous code of the state forbade such sensual indulgences. Women were not allowed, apparently, to walk the streets. The young were strictly watched by the elders, the elders jealously observed by the young; and any proneness to a practice subversive of that vigorous health in the population, considered essential to preserve the manhood of Sparta, would have been denounced as an attempt to introduce luxury and effeminacy—the vices, in their eyes, of slaves. To assert that in the whole state no virtuous women, and no public prostitutes, in our sense of the word, could be found, would be rash; but it is certain that no authority which has come down to us represents chastity as a Spartan virtue, or prostitution for money, or from predilection, one of their social institutions.

In Athens a wholly different picture is presented. There, and generally among the Ionians, the duty of the wife was to preserve a chastity as delicate and pure as any which is required in our strictest social circle. There, at the same time, the courtezan class existed, and men of all descriptions and all ages encouraged prostitution, to which a considerable class of women devoted themselves. This is a complete contrast with Sparta.

The young girls of Attica were early trained to all the offices of religion; they acquired considerable knowledge; their intellectual qualities were to some degree developed: they were educated to become housekeepers, wives, and mothers, such as we describe under those heads. Exercising considerable influence over their male relatives, they possessed consequently considerable weight in the community, and altogether held a higher position than the women of Sparta. They led secluded lives, yet they enjoyed many opportunities of intercourse with the other sex; and though, in their theatres, and in their temples, indecency of the grossest description was frequently displayed to their sight, they seem otherwise to have been somewhat refined in this respect. In Sparta, the virgins never hesitated to expose themselves naked before any circle of spectators: in Athens they observed at least the public forms of decorum, and, with the exception of the Hetairæ or prostitute class, were sufficiently modest in their conversation and in their behaviour.

Accustomed to be present at public spectacles, to converse with men, to share in the performance of ceremonies at religious or civic festivals, the women of Athens occupied a position somewhat approaching that which we believe is proper to their sex. Marriages, as among us, were contracted, some from sentiment, others from interest. We are led to form a high idea of the general morality prevailing in the Attic states of Greece at an early period, from the exalted view of love, of chastity, of matronly duties, urged in the writers of the time. This seems a fair measure to employ, since, in a later age, when morals were more corrupt, and the regular class of prostitutes might be confounded with the general society, the style and sentiment of poets and others formed an exact reflex of the prevailing state of morality.

Traditions point to a period in the social history of Greece, when men and women dispensed altogether with the ceremony of marriage, living not only out of wedlock, but promiscuously, without an idea of any permanent compact between two individuals of opposite sexes. If such a state of things ever existed, it must have been before any regular society was formed, and it is therefore vain to dwell upon it. Polygamy, we know, long continued in practice among the Greeks, though it was a privilege and a propensity chiefly followed by the powerful and rich. In Athens marriage was held sacred. The character of a bachelor was disreputable. So, indeed, was it in Sparta, where young men remaining single after a certain period might be punished for the neglect of a duty exacted from them by the severe laws of the state. In both states, but in different degrees, the prohibition of marriage within certain limits of consanguinity extended; but when once the union took place, it was, in Athens, a crime of great enormity to defile its sanctity. The influence of the

wife was, in the household, powerful; and commanding, as she did, the respect of men, the advantages of her position were so great, that to risk their loss by a transgression of the moral law, was not a common occurrence. We may therefore assign to the women of Athens a high average of morality, and consider them as having been held in remarkable estimation.

An important point in the manners of every people is the institution of marriage. From an inquiry into its estimation, whether it be held a religious rite, or a civil contract, or both, with various other circumstances in connection with these, we are aided in forming a just idea of the prevalent civilization. In the Doric states of Greece, it was esteemed as little more than a prudent ceremony, binding man and woman together for purposes of state. As among the savages of Australasia, it was the custom for a man to bear a woman forcibly from among her companions, when he took her to the bridesmaid's house, and, her hair being cut short and her clothes changed, she was delivered to him as wife. His intercourse with her however, was, for some time clandestine, and he shunned being seen in her society. This was the case with the wealthier maidens. The portionless girls were, from time to time, shut up in a dark edifice, and the youths, being introduced, accepted each the woman he happened to seize upon. A penalty was imposed on any one refusing to abide by the decision of chance.

Occasionally public ceremonies were enacted at the marriages of the rich; but from all testimony it appears certain that the union of man with woman at Sparta was entirely of a civil, and by no means of a sacred character. Private interest, sentiment, and happiness were indeed, in this, as in all other matters, subordinate to the public exigencies. When a woman had no children by her own husband, she was not only allowed, but required by the law to cohabit with another man. Anaxandrides, to procure an heir, had, contrary to all custom, two wives. The state excused no licentiousness for its own sake, but any amount for a public object *.

In Attic Greece, the ceremony of marriage was viewed in a more poetical light, and divinity was supposed to preside over it. We have already alluded to the notion of the promiscuous intercourse among them at a remote period; but, passing from this fable, we find traces of polygamy long discernible.

* Manners and Customs of Ancient Greece, by J. A. St. John.

Heracles maintained a regular seraglio. Egeus, Pallas, Priam, Agamemnon, and nearly all the chiefs, possessed harems, but these were irregularities, contrary to law and custom, and only in fashion among royal personages. The story of the two wives of Socrates seems a pure invention.

In the Athenian Republic, marriage, being held in reverence, was protected by the law. In the later and better known ages, consanguinity within certain limits was a bar to such union. Men, however, might marry half-sisters by the fathers' side, though few availed themselves of the permission. Betrothed long before marriage by their parents, the young man and woman were nevertheless allowed on most occasions to consult their own inclinations. Numerous religious rites preceded the actual ceremony, and heavenly favour was invoked upon it. The marriage was performed at the altar in the temple, where sacrifice was made, and a mutual oath of fidelity strengthened by every sacred pledge. Adultery was held a debasing crime, and divorce discreditable to man and wife *.

In connection with the subject of marriage is that of infanticide. It prevailed among the Greeks, under the sanction of philosophy. Among the Thebans and the Tyrrhenians it was, however, unknown. Why? Because they were more humane, or moral? Not by any means. They were among the most profligate societies of antiquity. It is generally shame which induces to child-murder women bearing offspring from illicit intercourse with men. Where no disgrace attaches to illegitimate offspring, the principal incentive to destroy them is taken away; and in Tyre, where female slaves served naked at the table of the rich, and even ladies joined the orgies in that condition, modesty was by no means a common grace of their sex.

The Thebans, a very gross people, made infanticide a capital crime; but allowed the poor to impose on the state, under certain circumstances, the burden of their children. In Thrace, the infant, placed in an earthen pot, was left to be devoured by wild beasts, or to perish of cold and hunger †.

In Sparta, clandestine infanticide was a crime; but the state often performed what it declared a duty, by condemning weakly and delicate infants to be flung into a pit. In Athens, on the contrary, it was left for desperate women, and cold-blooded men,

privately to accomplish the act, exposing their children in public places to perish, or to claim charity from some wayfarer. Frequently the rich had recourse to this, for concealing an intrigue, and left a costly dowry of gold and jewels in the earthen jar where they deposited the victim. The temple steps sometimes received the foundling; but occasionally they were left to die in desert places.

In the flourishing period of the Republic, however, poverty was so rare, indeed so unknown, that it seldom exacted these sacrifices from the humbler people. Infanticide was then left to the wholly unnatural who refused the burden, or the guilty who dreaded the shame, of a child.

But in the female society of that state, there was, as we have said, a sisterhood which exercised no inconsiderable influence on public manners. These were the Hetairæ, or prostitutes, who occupied much the same position which the same class does in most civilized communities of modern times. The youthful, beautiful, elegant, polished, and graceful, commanded, while their attractions lasted, the favours and the deference of wealthy and profligate young men, and, when their persons had faded, sank by degrees, until they dragged themselves in misery through the streets, glad to procure a meal by indiscriminate prostitution, with all who accepted their company. When children were born to them, infanticide usually—especially in the case of girls—relieved them of the burden.

The position the prostitute class of Athens occupied in relation to the other women in the community was peculiar. They entered the temples during the period of one particular festival—and in modern countries the church is never closed against them; but they were not, as among us, allowed to occupy the same place at the theatre with the Athenian female citizen. Yet this was not altogether to protect the virtue of the woman; it was to satisfy the pride of the citizen, since every stranger suffered an equal exclusion from these "reserved seats." Notwithstanding this, however, the courtezans occasionally visited the ladies in their own houses, to instruct them in those accomplishments in which, from the peculiar tenor of their lives, they were most practised, while it appears that both classes mingled at the public baths.

The Hetairæ, or prostitute class, exercised undoubtedly an evil influence on the society of Athens. They indulged the sensual tastes and the vanity of the young, encouraged among them a dissolute manner of life, and, while the power of their attractions lasted, led them into expensive luxury, which could not fail of an injurious effect on the community. The career of the prostitute was, as it is in all countries, short, and miserable at its close. While their beauty remained unfaded they were puffed up with vanity, carried along by perpetual excitement, flattered by the compliments of young men, and by the conversation of even the greatest philosophers, and maintained in opulence by the gifts of their admirers. Premature age, however, always, except in a few celebrated cases, assailed them. They became old, ugly, wrinkled, deformed, and full of disease, and might be seen crawling through the market places, haggling for morsels of provision, amid the jeers and insults of the populace.

In some instances, indeed, there occurred in Athens what occasionally happens in all countries. Men took as wives the prostitutes with whom they had associated. Even the wise Plato became enamoured of Archæanassa, an Hetaira of Ctesiphon. For many of these women were no less renowned for the brilliancy of their intellectual qualities than for their personal charms. Of Phryne, whose bosom was bared before the judges by her advocate, and who sat as a model to the greatest of ancient sculptors, all the world has heard. Her statue, of pure gold, was placed on a pillar of white marble at Delphi. Aspasia exercised at Athens influence equal to that of a queen, attracting round her all the characters of the day, as Madame Roland was wont to do in Paris. Socrates confessed to have learned from her much in the art of rhetoric. Yet these women, harsh as the judgment may appear, were common whores, though outwardly refined, and mentally cultivated. Instances, indeed, of high public virtue displayed by members of that sisterhood, distinguished among the Hetairæ of ancient Greece, are on record, and sufficient accounts of them have been transmitted to us to show that they were among the male society a recognised and respected class, while by the women they were neither abhorred nor considered as a pollution to the community. Still, prostitutes they were, to all intents and purposes.

The mean, the poor, and faded, were chiefly despised for their ugliness and indigence, not for their incontinence. It was in the Homeric ages, as we learn from the Odyssey, held disgraceful for "a noble maiden" to lose her chastity. But in Athens, at a later time, chastity in an unmarried woman was not held a virtue,

the loss of which degraded her utterly below the consideration of all other classes, or debarred her for ever from any intercourse with the honourable of her own sex. The Hetaira was not, it is true, admitted to mingle freely in the society of young women; but she was not shut out from all communication with them; while among men, if her natural attractions or accomplishments were great, she exercised peculiar influence. Consequently, it appears that in Athens the superior public prostitute had a *status* higher than that of any woman of similar character in our own day. If we look for a comparison to illustrate our meaning, we may find it in many of the ladies who at various periods have frequented our court—known but not acknowledged prostitutes*.

In the public judgments of Athens we find, it is true, a penalty or fine imposed on "whoredom,"† from which, however, the people escaped by a variation of terms, calling a whore a mistress, as Plutarch tells us. Solon, however, recognised prostitution as a necessary, or at least an inevitable evil, for he first built a temple to Aphrodite Pandemos, which, truly rendered, means Venus the Prostitute; and his view was justified by the declaration that the existence of a prostitute class was necessary, in order, as Cato also thought, that the wives and daughters of citizens might be safe from the passion which young men would, in one way or the other, satiate upon the other sex. Though procurers, therefore, were punishable by law, and the Hetairæ were obliged to wear coloured or flowered garments, it was enacted in the civil code of Athens, that "persons keeping company with common strumpets shall not be deemed adulterers, for such shall be common for the satiating of lust."

Brothels, consequently, existed in moderate numbers at Athens, and the young men were not discouraged from attending them occasionally. There were also particular places in the city where the prostitutes congregated, and a Temple of Venus, which was their peculiar resort. We find in the poets passages, indeed, advocating the support of whores ‡.

Still, respected and beloved as the Hetairæ were among their friends and lovers, recognised by the law, and protected by it,

* This view is chiefly drawn from information collected in Manners and Customs of Ancient Greece, by J. A. St. John.

general public respect was denied them, for the Athenians estimated above their brilliant charms the modest virtues of inferior women*.

One of the most remarkable features in the public economy of Athens was the tax upon prostitutes, introduced also in Rome by Caligula. It was annually farmed out by the Senate to individuals who knew accurately the names of all who followed this calling. It is to be regretted that their statistics have not been furnished to us. Every woman, it appears, had a fixed price, which she might charge to the men to whom she prostituted her person, and the amount of the tax varied according to their profits. Apparently, they were principally "strangers" who filled the ranks of the Hetairæ, for we find that if persons enjoying the rank and privilege of citizens took to the occupation, a tax was imposed on them as on the ordinary prostitutes, and they were punished by exclusion from the public sacrifices, and from the honourable offices of state. The same writer informs us, on the authority of Demosthenes, that a citizen who cohabited with an alien paid a penalty, in case he was convicted, of a thousand drachmas, but the penalty could not often have been enforced, as the laws of Solon recognised prostitution; it was a feature in the manners of the city, and brothels were fearlessly kept, and entered without shame. Numerous evidences of this have been supplied us†. To preserve a respect for chastity, however, and to inculcate a horror for the prostitute's occupation, the same code allowed men to sell their sisters or daughters when convicted of an act of fornication, which, in Athens, as elsewhere, frequently was the first step in the regular career of these women ‡.

The dishonour thus accruing to the general body of prostitutes, though a small class of them enjoyed many superior advantages from their wealth, and the polish of their manners, served at Athens, in some degree, to preserve public morality. The system never seems to have reached the height which it has gained in many of our modern cities, where married women often follow the occupation, and live upon its gains §.

In Corinth, however, prostitutes abounded, and the Temple of Venus in that city was sometimes thronged by a thousand of them. They were usually

⁎ The rule is, that where the greatest number of males marry at an early age, the greatest number of females do so likewise—the exceptions being Dorset, Somerset, and Warwick, among the males, and Sussex, Lincoln, Durham, and Kent among the females.

††† There are, on an average, rather more than 3 females married at an early age to every male.

THE ILLEGITIMATE BIRTHS AND EARLY MARRIAGES IN THE SEVERAL COUNTIES COMPARED.

(† denotes *plus.*) (* denotes *minus.*)

Warwick	*16	†7	*3
Somerset	*6	†9	*17
Dorset	*1	†9	*7

⁎ In the majority of these counties some peculiar form of courtship (as "night courtship" and "bundling") prevails.

⁎ The rule appears to be, that in those counties in which there are the greatest number of Early Marriages, there are (*generally*) the greatest number of Illegitimate Children, and *vice versâ*.

the most beautiful women of the state, presented or sold to the temple, who prostituted themselves for hire. They were of a superior kind, admitting to their embraces none but men who would pay munificently, and in this manner many of them are said to have accumulated large fortunes *.

Tabular statements, and numerical estimates, have been wanting to complete this glance at the system in ancient Greece; but it may, nevertheless, afford a just idea of the extent and character of the prostitute class there.

Of Prostitution in ancient Rome.

If our knowledge of ancient Greece, with reference to its moral economy, is slight, ancient Rome is still less understood. Nothing, indeed, like a detailed account of its social institutions has been preserved; its scheme of manners is incompletely comprehended; and only an outline picture of its private life can be formed from passages supplied by hundreds of authors, from allusions in the poets and in the satirical writers. German scholars have laboured industriously in the field of classical politics; but the social economy of Rome has been neglected, or, which is worse, obscured by them. We are, therefore, enabled only to afford a general sketch of the subject in connection with the great Republic, and the imperial system which grew out of its decay.

Examining the condition of the female sex, especially with reference to prostitutes, we must in Rome, as in all other states, distribute our observations over several distinct periods—for such there were in the social history of the nation.

In the more honourable days of the Republic, women occupied a high status. While the state was extremely young we find them, indeed, in perpetual tutelage; but gradually, as institutions were improved and manners refined, they rose to independence, and formed an influential element in society. The matron, in particular, stood in her due position. Respected, accomplished, allowed to converse with men, she was, in the most flourishing era of Roman history, a model for her sex. She presided over the whole household, superintended the education of the children, while they remained in tender years, and shared the honours of her husband. Instead of confined apartments being allotted to her as a domestic prison, the best chambers in the house were assigned, while the whole of it was free to her. Other circumstances in her condition combined to invest her with dignity; and the consequence was, that the Roman matron seldom or never transgressed against the moral or social law. No divorce is recorded before the year 234 B.C.; and that instance was on account of the woman's barrenness—a plea allowed by the law, but universally reprobated by the people. Yet the obstacles to this dissolution of the marriage compact were by no means formidable. Under the imperial régime, when there was less facility, divorces were more frequent.

The Roman law of marriage was strict. Degrees of consanguinity were marked, though within narrower limits than among us, within which marriage was not only illegal, but wholly void, and any intercourse, by virtue of it, denounced as incest by the law. Public infamy attached to it—not only the odium of opinion, but a formal decree by the prætor. Adultery was held as a base, inexpiable crime. It was interdicted under every penalty short of death, and even this was allowed under certain circumstances to be inflicted by the husband. Wedded life, indeed, was held sacred by every class from the knights to the slaves, though among these social aliens actual marriage could not take place. Celibacy was not only disreputable, but, in a particular degree, criminal; while barrenness brought shame upon the woman who was cursed with it. In an equal, or a greater ratio, was parentage honourable. Polygamy was illegal; but the social code allowed one wife and several concubines, occupying a medium position, finely described by Gibbon, as below the honours of a wife, and above the infamy of a prostitute. Such institutions were licensed that common whoredom might be checked; though the children born of such intercourse were refused the rank of citizens. Often, indeed, they were a burden to the guilty as well as to the poor; and infanticide, which was declared in 374 B.C. a capital crime, was resorted to as a means of relief.

If we examine our question in connection with marriage among the ancient Romaus we find a curious system. First, there were certain conditions to constitute *connubium*, without which no legal union could be formed. There was only connubium between Roman citizens *; there

* Boeck. Potter. Mitford's notions of the Hetairæ appear to have been somewhat fanciful.

* Occasional exceptions occurred. At one time there was no connubium between the plebeian and the patrician; but the Lex Canuleia allowed it.

was none where either of the parties possessed it already with another; none between parent and child, natural or by adoption; none between grandparents and grandchildren; none between brothers and sisters, of whole or half blood; none between uncle and niece, or aunt and nephew: though Claudius legalized it by his marriage with Agrippina, the practice never went beyond the example. Unions of this kind taking place were void, and the father could claim no authority over his children. Mutual consent was essential—of the persons themselves, and of their friends. One wife only was allowed, though marriage after full divorce was permitted.

There were two kinds of marriage,—that *cum*, and that *sine conventione*. In the former the wife passed into her husband's family, and became subject to him; in the latter she abdicated none of her old relations, and was equal to her husband. There was no ceremony absolutely essential to constitute a marriage. Cohabitation during a whole year made a legal and lasting union; but the woman's absence during three nights annually released her from the submission entailed by the marriage *cum conventione*. Certain words, also, with religious rites, performed in presence of ten witnesses, completed a marriage; but certain priestly offices, such as those of the *flamen dialis*, could only be performed for those whose parents had been wedded in a similar way*. The sponsalia, or contracts between the man and his wife's friends, were usual, but not essential, and could be dissolved by mutual consent. The Roman idea of marriage was, in a word, the union of male and female for life, bringing a community of fortune, by a civil, not a sacred contract. Yet from the ceremonies *generally* observed, it is evident that an idea, though unrecognised, of a religious union, existed among the Romans in their more pious age.

With respect to property, its arrangement depended on settlements made before hand. Divorce was at one time procured by mutual consent, though afterwards it became more difficult, but never impossible.

There was in Rome a legal concubinage between unmarried persons, resembling the morganatic or "left-handed" marriage, giving neither the woman nor her children any rights acquired from the husband. Widowers often took a concubine, without infamy*.

The law of Romulus, enacting that no male child should be exposed, and that the first daughter should always be preserved, while every other should be brought up, or live on trial, as it were, for three years, has misled some writers into giving the Romans credit for a loftier humanity. No parent, it is argued, would destroy a three years' old child. Nevertheless, it is certain that, in the imperial age, at least, infanticide and child-dropping were frequent occurrences. Deformed or mutilated infants, having been shown to five witnesses, might be destroyed at once. The Milky Column, in the Herb-market, was a place where public nurses sat to suckle or otherwise tend the foundlings picked up in various parts of the city. In the early Christian age it was a reproach to the Romans that they cast forth their sons, as Tertullian expresses it, to be picked up and nourished by the fisherwomen who passed. Mothers would deny their children when brought home to their houses. Some strangled them at once. Various devices were adopted among them, as among other nations of antiquity, to check the overflow of population, as well as to hide the crimes of the guilty. Thus the Phœnicians passed children through fire, as a sacrifice; the Carthaginians offered them up at the altar; the Syrians flung them from the lofty propylæa of a temple†. One observation, however, applies to the Romans, and, we believe, to every other nation, savage or civilized, in every age of the world—exceptions being invariably allowed. Cruel as may have been the laws sanctioning infanticide, when once the child was received into the bosom of the family it was cared for with tenderness, and, generally, with discretion. It is not sentiment, but justice, which induces us to say that the mother, having once accepted her charge, has seldom been guilty of wilful neglect. The abandoned and dissolute, especially in those societies where fashion has made the performance of maternal duty ridiculous, if not disreputable, have consigned their offspring to others; but women in their natural state usually fulfil this obligation.

In Rome, from various causes, public decency was, at least during the republican period, more rigidly observed, and licen-

* The sacerdotal functionary, termed *flamen dialis*, like the high-priest of the Jews, could only wed a virgin of unblemished honour, and when she died, could not marry again, but was forced to resign his office.

* See Julian Law, Ulpian, Gaius, Tacitus, Suetonius, and Dion Cassius, from whom, with various others, Smith's Dictionary is compiled.

tiousness less common and less tolerated than in Sparta or even the later age of Athens. None of its institutions rivalled the dissolute manners of Crete or Corinth. One cause of prostitution being less common was the licence of concubinage, which was to the rich a preferable and a safer plan of self-indulgence. It existed, however, in the State, and employed a considerable class of women, though we are told the accomplished prostitute was known as a Grecian import. Nevertheless, the frequent allusions of the laws to these women prove that they formed no insignificant element in the society of the capital.

Lenocinium, or the keeping of female slaves to hire them out as prostitutes for profit, was an offence rather against the moral than the written law of Rome. The lenones, in many instances, kept brothels or houses open for the trade of prostitution. They purchased in the market handsome girls, for each of whom a sum equal to about 250*l*. of English currency was given—from which we infer that the rates charged in the superior establishments of this kind were somewhat high. Free women were also kept for the same purpose, upon a mutual agreement. The practice was not actually interdicted, but branded as infamous by the prætor's declaration. No woman, however, whose father, grandfather, or husband had been a Roman knight was allowed to prostitute herself for gain. The independent prostitutes, or those who occupied houses of their own, were compelled to affix on the door a notice of their calling, and the price they demanded. They were also required when they signified to the prætor, as they were bound to do, their intention of following this disgraceful occupation, to drop their real names, which they resumed whenever they abandoned that mode of life. Cato, the censor, recognised prostitution as Solon did, and Cicero declared no State ever existed without it. Notwithstanding this, the occupation of the prostitute was, in the republican age, so infamous that a comparatively small class practised it; but under the emperors it grew so prevalent, that during the reign of the few of them who even pretended to morality, the severest edicts appeared called for against it. Caligula, however, made a profit from the system. The lenones were subject to a tax, which fell, of course, as in Athens, upon the prostitutes themselves. No check, therefore, was offered by him to prostitution. But Theodosius and Valentinian sought, by formidable penalties, to prevent parents from prostituting their children, and masters their slaves, for gain. Lenocinium was interdicted under pain of the scourge, banishment, and other punishments. In one age public opinion, in the other the whip, held guardianship over the morals of the State.

The owners of houses who allowed lenocinium to be carried on on their premises were liable to forfeit the property, besides paying a price of ten pounds weight of gold. Such edicts, however, only drove immorality into the dark. When the prostitutes could not find enough brothels to harbour them—and, indeed, at all times the poorer sort were excluded from these large establishments—places of refuge were still open. The *fornices* of Rome were long galleries, divided into a double row of cells—some broad and airy, others only small dark arches, situated on a level with the street, and forming the substructure of the houses above. Some of them, as those of the Formian villa of Cicero, were tastefully stuccoed, and painted in streaks of pink, yellow, and blue. In these long lines of cells the prostitutes of the poorer class were accustomed to assemble, and thence was derived the ecclesiastical term fornication, with its ordinary English meaning. Allusions to this practice occur in the works of Horace and Juvenal, as well as other writers. Some of the arches appear to have been below the surface of the ground, as we find a decree of Theodosius against the subterranean brothels of Rome.

The great satirist who has left us his vivid, though exaggerated picture of manners in the imperial age, supplies some allusions in elucidation of our subject. He speaks of the "transparent garments" worn by prostitutes, as by the dancers of ancient Egypt; of the "foreign women" who swarmed in its "foul brothels;" of the "gay harlots' chariots" dashing through the streets; and of the porticos and covered walks forming for these women places of promenade. We learn that some of them were forced, as a punishment for disorderly behaviour, to wear the male toga, while most were distinguished by a yellow head-dress. The fornices were publicly opened and closed at certain hours. The women stood at the doors of their cells, in loose, light attire, their bosoms exposed, and the nipples gilt. Thus Messelana stood at the door of the lupanaria, with her breast adorned with this singular ornament*.

At various periods efforts were made to suppress the prostitutes' calling, but never with success. The lawmakers of the imperial age gave no example of the morality

which their edicts pretended to uphold. Thus, the bawds who inveigled or ravished girls from their homes, to obtain a livelihood by their prostitution, became liable to "extreme penalties," though what these were we know not. The law of lenocinium was more widely interpreted, as manners became more corrupt. If a husband permitted his wife to prostitute herself that he might share the gains, it was lenocinium. Justinian allowed a woman the privilege of divorce, if her husband endeavoured to tempt her into such adultery: he was forced also to restore her dowry. On the other hand, if a woman committed the crime, it was lenocinium for the husband to receive her again, to spare the adulterer if caught in the act, or to refrain from prosecuting him if otherwise detected. If a man married a woman convicted of adultery, discovered a crime of this kind and was bribed to hold his peace, commenced a prosecution for adultery and withdrew it, or lent his house for rape or prostitution, the Julian law made him guilty of lenocinium, and penalties of various kinds were attached to the offence in its different modifications.

Lupanaria, or common brothels, were at all times considered infamous. Young men seem to have been more careful to visit them in secret than at Athens, where they visited and left them in the light of open day, and were encouraged to do so by the poets. There was, however, another class of disreputable places of assembly, to which a similar exists in most modern cities. These were the lower order of *popinæ*, or houses of entertainment, not absolutely recognised as "stews," but generally known to be the resorts of prostitutes and their companions. In Pompeii there appears to have existed a class of the same description, for in one of the wine-houses discovered there, an inner room is situated behind the shop, the walls of which are covered with lewd and filthy pictures. Pornography, or obscene painting, was much practised at Rome, and doubtless afforded much pleasure to the company who nightly assembled in the Ganeæ, or regular brothels.

As among the Greeks, instances of men willing to marry prostitutes occurred among the Romans. It was found necessary to check the practice by rendering it disreputable. The penalty of public infamy was denounced against all freemen contracting such an union; while a senator, and the son of a senator, were especially forbidden.

The prostitutes of Rome, like those of many other countries, varied their principal calling by others which rendered them more attractive to the dissolute youth of the city. They cultivated the arts of dancing, singing, and playing on musical instruments. They performed lascivious dances at their places of assembly, playing on the flute, and practising all those tricks of seduction employed so successfully by the Almé of Egypt.

Difficulties have arisen before many inquirers into the social condition of the ancient Romans, as to whence the prostitutes came, seeing that they were chiefly strangers. Some light, we think, is thrown on the subject by the fact that the Ambubaiæ were Syrian musicians, who performed dances in Rome, and, like the Bayaderes of India, the Almé of Egypt, and the dancers of Java, led a life of prostitution. They continued long to be imported; for, in the History of Gibbon, we find particular notice of the lascivious dances performed by the Syrian damsels round the altars on the Palatine Hill, to please the bestial senses of Elagabalus. During the public pantomimes, the prostitutes danced naked before the people; and, at the Floralian festival, the actresses at the theatre, who are known to have been common prostitutes, were compelled to strip, and perform indecent evolutions for the delight of the audience. This refers, however, to the imperial age. It was at no time a task of much inconvenience to divest themselves of clothing, for the harlots never encumbered themselves with much. In this they resembled the Hetairæ of Greece, whose thin slight garment was so insufficient for the purposes of decency, that it was designated as "naked." This was not, however, from hardiness or simplicity, but merely to promote the profit of their calling. In other respects the luxury of the wealthy prostitutes was boundless, and they were borne through the streets on the rich and elegant lactræ or portable couches, softly pillowed on which they reposed their limbs in voluptuous indolence. In the reign of Domitian a decree was passed that no whore should in future make use of these couches, which were reserved as an especial luxury to the privileged classes of Rome.

The edicts against prostitution increased in severity under various emperors. The severity of Constantine enacted that a man guilty of rape should die, whether he accomplished his purpose by violence, or by gentle and gradual seduction. The virgin who confessed her consent, instead of procuring a mitigation of this sentence, exposed herself to share the penalty. Slaves

who were accomplices in the crime of procuring young women for prostitution, were punished by being burnt, or having boiling metal poured down their throats. The consequence of such a savage law was, that it could not be generally applied; nor was it enforced by the example of the emperor, who, once rigidly strict, turned dissolute and luxurious towards the close of his reign.

It will be seen, from the information here collected, that no actual knowledge exists of the precise extent of the prostitute system in Rome. Facts, and some of these extremely curious, have been preserved in connection with it; but the statistics of the question are wholly lost, if, indeed, they ever existed. On this account, it appeared possible to do no more than bring those facts together, and, throwing them into a general sketch of the morality prevailing at different periods in the social history of that state, to draw thence an idea of the truth. Under the comparatively virtuous Republic, a line could certainly be drawn between the profligate and the moral classes of the community. Under some of the emperors such a distinction was wholly impossible. The vulgar prostitute was commonly met at the tables of the rich, and the palace itself was no more than an imperial brothel. A few notes on the history of the empire will justify these remarks.

In the early period of the decline, the licentious amours of Faustina were excused, even encouraged, by her husband, and the nobles paid homage in the temples before the image of an adultress. In the eyes of Commodus virtue was criminal, since it implied a reflection upon his profligacy. Dissolving his frame in lust amid 300 concubines and boys, he violated by force the few modest women remaining near his court. Julia, the wife of Severus, though flattered in life and death by public writers, was no better than a harlot. We have already noticed the pleasures of Elagabalus, who committed rape upon a vestal virgin, and condescended to the most bestial vice. The nobles readily followed his example, and the people were easily led into the fashion. Maximin drowned every coy maiden who refused his embraces. In process of time, the most degrading features of Asiatic profligacy were introduced into Rome, and eunuchs crowded the palaces of the emperor and his nobles. History alludes to no more vulgar prostitute than the Empress Theodora, who played comedies before the people of Constantinople, and prostituted her person—of unparalleled beauty as it was—night after night to a promiscuous crowd of citizens and strangers, of every rank and description. She exhibited herself naked in the theatre. Her sympathy for the prostitute class may be indicated by almost the only virtuous action recordered of her;—inducing her husband Justinian to found a monastery on the shores of the Bosphorus, where 500 miserable women, collected from the streets and brothels, were offered a refuge. When we remember the usual relative proportion of objects relieved by charity, to the numbers from which they are selected, this indicates a considerable trade in prostitution then carried on in Constantinople. When, however, such a social system prevailed, no inquiry could fix the professional class of harlots, since moral women, if any existed, were certainly exceptions.

It is always necessary, while inquiring intó the morality of any people, to inquire into the extent to which the practice of procuring abortion was carried, and how it was viewed. Montesquieu justly observes, that it is by no means unnatural, though it may be criminal, for a prostitute, should she by chance conceive a child, to seek to be relieved from the burden. She has no means of support except one which she cannot possibly follow and at the same time fulfil the duties of a mother. These considerations, perhaps, had some weight with the legislators of Rome, as well as those reasons of political prudence which in various ancient states recognised infanticide. That it was practised to some extent there, is shown by frequent allusions in various works. It has been asserted, indeed, that the custom of procuring abortion prevailed to such an extent, that, combined with celibacy, it materially affected the population of the state, but this appears a false view. There are no accounts to support such an idea. It is not known at what particular time a law was introduced against it. Certainly it was held in a different light than it is by our religion, and our civilization. Plato's republic permits it. Aristotle also allows it to be practised under certain circumstances, but only before the child is quick in the womb. So, also, among the Romans, it seems long to have been unrestrained by law, though it is impossible to believe that the natural instincts of women would not deter them, except in desperate situations, from such unnatural offences.

Such is the view of the prostitute system, with a sketch of general morality, which the facts preserved by history enable us to offer. It appears from these facts, that, during the more flourishing period of

the Roman state, the prostitutes formed a class, to which the principal immorality of the female society was confined, while in the later or imperial age profligacy ran loose among the people, so that the distinction between the regular harlot and the unrecognised prostitute was all but lost. Chastity, under the Republic, was a peculiar Roman virtue, and the prostitutes were usually foreigners, while we do not find that they ever mixed with reputable women who had characters to lose*.

Of Prostitution among the Anglo-Saxons.

We leave the countries of classical antiquity and arrive at the Anglo-Saxons of our own history, in whom the reader will feel a peculiar interest. Unfortunately, our usual observations with reference to ancient times, apply to them also. Extremely imperfect records exist of their manners, laws, and institutions. The learned and industrious Sharon Turner has collected most of the facts known, yet neither the word prostitution, nor any term analogous to it, is to be found in his work. In the Leges Anglo-Saxonicæ, we find laws and regulations in reference to the chastity of the women, but nothing which indicates the existence of a class professionally addicted to prostitution. Nevertheless, it is improbable that such a class was utterly unknown, for the modern historians, as well as the old chroniclers, who have described the era, allude repeatedly to the licentious manners of the period. Gluttoning and deep drinking may, however, have excused the epithet, without supposing any prevalence of immorality.

Sharon Turner refers us to the Maories of New Zealand, for a parallel to the manners and condition of Great Britain, when first invaded by the Romans. As far as profligacy goes, the comparison appears correct.

Among the Britons, however, prevailed the extraordinary and pernicious institution of small societies of ten or twelve men, with a community of women among them. Ceremonies of mariage, indeed, took place, but for no other purpose than to provide that each woman's husband should maintain all her children, whoever their fathers might be. In some of their religi[illegible]s ceremonies women officiated naked, and in all their modes of life a coarse licentiousness obtained.

The Romans introduced a more refined luxury, and manners became less coarse, though no less profligate. The Saxons, however, then transported themselves to these islands from the Cymbric Peninsula, and the civilization of the country passed through a complete revolution. In their original country they had displayed a system of manners peculiar to themselves, and the other wild races inhabiting the mighty woods of Germany. Their laws against adultery were of the most savage character. When a woman was guilty of it, she was compelled to hang herself, her body was burned, and the execution of the adulterer took place over the pile of her ashes. Among some communities the punishment was still more severe, and infinitely more barbarous. The guilty creature was whipped from village to village by a number of women, who tore off her garments to the waist, and pierced her with their knives. Company after company of them pursued her until she sank under the shame, torture, and loss of blood. Chastity, indeed, was very generally regarded among these rude people, but their ideas were very foreign from ours. The degrees of consanguinity within which marriage was prohibited were extremely narrow, a son being permitted to marry his father's widow, provided she was not his own mother.

In their marriage customs the Anglo-Saxons displayed considerable regard for the female sex, although the wife was taken rather as the property than as the companion of the husband. The original laws of Ethelbert, indeed, as we have said, made the transaction wholly one of purchase; but in the reign of Edmund a more refined code was established. The betrothal usually took place some time before the actual ceremony. This was held as a sacred tie, the high-priest being at the marriage to consecrate it, and pray for a blessing on the wedded pair*.

* Taylor's Elements of the Civil Law; Becker's Private Life of the Greeks and Romans; Suetonius, with Burmann's Notes; the Codes of Justinian and Constantine; Smith's Dictionary of Antiquities; Adams's Antiquities; Fergusson's Roman Republic; Niebuhr's History; Gibbon's Decline and Fall, supply facts for the above; while the writings of Horace, Juvenal, Lactantius, Dion Cassius, the Augustine History, and numerous other authors, afford scattered notices, not easy to collect or digest.

* To show that a prostitute class existed, among women without means of support, we might mention instances of wills in which mothers left property to their daughters, on condition that they should marry or keep themselves chaste, and not earn money by prostitution.

The manners of the Anglo-Saxons, after their settlement in England, underwent considerable improvement. They became, indeed, to a degree civilized. Their women were no longer the savages of Germany. They occupied a position wholly different from that of their sex among the more polished and luxurious nations of the East. It was, we may say, similar to that which they at present fill among us. They were recognised as members of the body politic, could bequeath and inherit property, could appeal to the law against any man, they possessed, in a word, the rights, the duties, and the public relations of citizens. Of course, in all these particulars, their position was modified by the natural restraints imposed on their sex. This refers to the more improved period of their civilization. In the laws of Ethelbert a man was permitted to buy a wife, provided he did it openly. By Edmund's time, however, the practice was changed, and the woman's consent, as well as that of her friends, was necessary. The man was also pledged before the law to support and respect her. She carried public protection into her new home. Considerable honour, consequence, and independence were there pre-enjoyed by the female sex. Nevertheless there continued long to be in the transaction much of a business character, and the consent of the woman was frequently no more than submission to the terms of a bargain struck between her lover and her parents. By some husbands, indeed, a wife seems to have been considered as little more than a property. We find adultery, for instance, allowed to be compounded. "If a freeman cohabit with the wife of a freeman he must pay the fine, and obtain another woman with his own money, and lead her to the other." In other words, when he has destroyed the value of one wife, he must buy a fresh one for the injured husband.

This would seem to indicate that women were to be had for money. Adultery, indeed, was at all times an affair of payments. It was punished only by various fines, varying according to the rank of the woman. The chastity of the high noble's wife was valued at six pounds, that of a churl's attendant at six shillings.

In the Leges Anglo-Saxonicæ we find many regulations laid down respecting rape and fornication, which imply the occasional practice of those crimes. From the tone of the enactments on the subject, it seems impossible reasonably to doubt that a class of women existed who prostituted themselves for gain or pleasure to the other sex. None such, it is true, is directly indicated. We find, however, a rule of the venerable Bede, that any "slave woman" or "servile" turning her eyes immodestly on men, is to be severely chided. Blount also, quoted in Brand's "Popular Antiquities," with the historian Henry, describes the punishment of the cucking stool, as inflicted by the Anglo-Saxons, both in Germany and in England, upon scolds, disorderly women, and strumpets, who in the more barbarous society on the Continent were suffocated in marshes. In Cornwall harlots were long punished in the ludicrous and degrading manner described by Brand.

In the absence of any ground upon which to stand, we cannot describe a particular class among the Anglo-Saxons as addicted to prostitution, but from the whole colour of their civilization, from the rudest to the most refined period, it is evident the practice was followed, in a greater or less degree*.

OF PROSTITUTION AMONG THE BARBAROUS NATIONS.

Introduction.

In surveying the social aspects of the barbarian world, we discover many striking phenomena. The relations of the sexes, among uneducated races, appear modified by every circumstance of their position; but everywhere the natural ascendancy of the strong over the weak is displayed. A few savage communities allow women a position nearly level with that of the men; but wherever this is the case, a degree of civilization has been attained.

If we divide mankind into two classes—the civilized and the savage—forming an ideal of both extremes, we shall not find one tribe or community to occupy either pole of our supposed sphere. No one requires to be told that every part of the human race is still below the perfect development of its good attributes; but the observation is equally true, though less generally accepted, that every family of creatures showing our nature has advanced beyond the utterly savage state. When we find men wandering not only unclothed, but unhoused, over the earth, and following only their animal propensities, we may

regard them as wholly untaught. At present no such tribe is known. Every human being that has come under our notice has progressed beyond the simple gratification of his appetites. The love of ornament and the practice of exchange have raised him one step in the scale.

The Africans, the Australians, the New Zealanders, the ruder tribes of the Pacific Isles, the Dyaks of Borneo, and the natives of Sumatra and Celebes, with the Indians of North and South America, may be included under the appellation *barbarous*. They vary, however, in the characteristics of their barbarism, as the nations of Europe vary in the characteristics of their civilization. They are even divided into classes. (1) The hunters, with little property in the soil, precarious means of existence, and migratory habits; the fishers, who are only the hunters of the sea; (2) the pastoral tribes, with property in herds and flocks, nomade, and therefore little property in the soil; (3) the agricultural tribes, permanently or temporarily fixed to localities, whose means of life are less precarious, and whose habits are more regular than those of the two former. The third is the most educated, the second the most innocent, the first the most simple state. It is among the shepherds that women enjoy most consideration, and that morality is highest. The hunters are more savage, and the tillers of the earth more sensual.

In judging the condition of the female sex, it is always necessary to hold in view the general state of manners. When we inquire how husbands behave to their wives, and how parents treat their daughters, we must ask also how they live themselves. Where the male sex is degraded the female will be so. On the other hand, the refinement of any people may be estimated by the condition of its women. The islanders of Celebes are among the most elevated of barbarian races, and the sexes are nearly on an equality. The hordes of Western Africa are the most gross and ferocious of savages, and their women are treated as reptiles. The Indians of North America offer, apparently, an exception to this rule, for their lofty, proud, and polished warriors behave contemptuously to the squaws in their wigwam, who crouch to the earth while their lords stand haughtily before the most powerful conquerors. But the Choctaws and the Cherokees are in reality as far removed from true civilization as the dwellers in New Zealand. The amenities and not the arts of life civilize men. Wherever in the Indian village the gentler influences of humanity prevail, the feebler sex is treated with respect and affection.

The points of contrast between barbarian and civilized races display themselves strongly in relation to the condition of the female sex. Throughout the savage portions of Africa one system of manners prevails. The men occupy the lowest stage of the social scale. They are neither hunters, fishers, shepherds, nor tillers of the soil; but mix up several occupations, though none of an elevating character. Some raise a few materials of food; others collect ivory in the woods; others live on the profits of the slave-trade; but the greater number subsist on the refuse of what they gain in the service of their petty kings. They have been sophisticated from the simplicity of savages without acquiring one grace from civilization. Subject to the gross caprice of princes more miserable than themselves, they have remained beyond the reach of every humanizing influence, and, as a natural consequence, their women are debased. Polygamy produces its worst results. The wife is an object of barter; a slave, whose labour assists to support her owner. In some parts diligence is more valued than chastity. In others the husband makes a profit from his wife's prostitution. The slave trade has assisted largely towards this melancholy state of manners. The finer sentiments of humanity are altogether lost, and the contempt for life, as well as for all that is amiable or pure, has reduced men far below the level of the brute creation. We speak literally in saying that a nobler, happier spectacle is presented among the antelope and elephant herds than among the swarms of men and women corrupting in Africa. In the few parts where the male sex has risen from this debasement, the female has been equally improved. The barbarous Edeeyahs offer an example.

The savages of Australia differ in many respects from those of Western Africa. They are even less educated, but they are also less ferocious; their women are their abject servitors, but there is more humanity in their treatment. They have scarcely approached so near to the forms of regular society, as to systematize the intercourse of the sexes. Nevertheless, among some tribes we not only find the institution of marriage respected, but wives guarded with Turkish jealousy. Among a people which does not dwell in regular habitations, or even lodge in roomy tents, it is scarcely possible to imagine the sanctity of a man's harem; but it is true, notwithstanding, that a similar seclusion is

Original from HARVARD UNIVERSITY

enforced. The Australian woman, in the desert and under the open sky, is hedged round by her husband's jealousy as securely as the ancient German was in her unwalled shelter of thatch.

It is seldom, however, that among barbarous races we find the sentiment of chastity in its abstract sense. Women are generally treated as though their inclinations were licentious, and in this consists one great line of distinction between civilization and barbarism. With the one, moral influence—with the other, material force, is employed as the guardian of female honour. The result is important to be noticed. Women are depraved by the rude and gross means devised to keep them virtuous. Where the moral sentiment is feebly developed, guilt is created by the efforts made to prevent it. The wife perpetually watched, as though her heart were full of adultery, becomes an adulteress. The young girl continually guarded, with the avowed object of compelling her to be chaste, loses insensibly any natural feeling she may have possessed, and covets the opportunity to sin.

In the South Sea Islands this truth is illustrated; in New Zealand it is still more strongly proved. It is taken for granted that a woman will prostitute herself if she can. The state of morality is consequently so low that it is difficult for parents to preserve a daughter's virtue until she is given in marriage. To prevent her holding *vicious* intercourse she is forbidden to hold *any* intercourse with the opposite sex.

Another characteristic of civilized races is the separation of the vicious from the moral classes; they systematize the offences against society. Every class of vile persons becomes, as it were, an isolated community; the prostitute is segregated from the rest of her sex. In some barbarian states, as in Dahomey, the same division is effected; but the kings of that country have sought to mimic the forms of educated communities. The professional is distinguished from the habitual prostitute only by her open assumption of the title; but the immorality of the female sex in Dahomey is far from being represented by the order of confessed harlots.

The inhabitants of some islands, and the shores of bays and roadsteads, have discovered that in prostituting their women to the crews of trading ships they have a readier means of subsistence than was offered by their former industry. This has produced a frightful system of vicious commerce, which still prevails to a great extent in the Pacific, as well as in New Zealand and the ports of Africa. It is for Europeans to repair the evil created by the incontinence of their predecessors. Many captains of vessels have already effected much good by forbidding women to come on board.

In proportion as nations approach the higher stages of civilization does the respect for human life increase. Infanticide is practised with the least remorse by the most savage tribes. Among those communities with whom the means of existence are precarious this crime is most common. Wherever barbarians have been induced to labour, and secured in the enjoyment of their earnings, the natural feelings of the breast have revived; and mothers who have slain six infants cherish the seventh as a sacred possession. Missionary enterprise has produced much good in this respect; while the beneficent rule of our Indian government has bestowed incalculable blessings on the people of the East, among whom the system of infanticide is daily becoming rarer, and the condition of women more elevated.

The same may be remarked of that unnatural practice upon which, as indeed on all kindred subjects, writers are reluctant to touch—that, we mean, of destroying the unborn fruits of union. The savage regards it as an act rather meritorious for its ingenuity than abominable for its unnatural character. The cause that encourages infanticide encourages this, which, indeed, is the less horrible crime. The woman is less reluctant to extinguish the vitality of a being which has become to her dear only in anticipation, than to quench a life which has once been embodied before her eyes, and warmed in her bosom. The operation, so dangerous to females in civilized communities, is, like childbirth, far easier among savages. The native of the Bornean woods, without any of the delicacy engendered by luxury, may one moment be without a pang giving birth to an infant, and the next be washing it in a neighbouring brook. The Malayan lady, bred in a city in indolence and comfort, suffers agony under which she sometimes perishes before her offspring has breathed. So it is with the practice of destroying the unborn child. Civilization lessens in all creatures their means of independent life, and their powers of endurance; but it also enables them to discover or compound the elements by which these artificial ills may be remedied.

In proportion as the intercourse of the sexes is loose is the difficulty of learning the actual extent of immoral practices. The prostitute class, as we proceed from

the pure savage to the highest point of civilization, becomes more and more distinct—being more conspicuous because more isolated. This is accompanied by another process, which is a superior standard by which to measure the social elevation of a people. Women respect themselves in proportion as men respect them. Where locks and bolts, scourges and cudgels, are the guardians of female chastity, it is only preserved when there is no opportunity to lose it. When the protecting influence springs from within, the woman moves a virtuous being, defended even from a licentious glance by the impenetrable cloud which her native modesty and virtue diffuse around her.

Of Prostitution among African Nations.

In the wide field of inquiry presented by the barbarian races of our own time, Africa occupies a prominent place. Some of the most wild and savage tribes of the human family are to be found on that immense peninsula. Many degrees in the inferior scale of civilization are represented, from the uncouth Hottentots of the south to the wandering Arabs of the desert, in whose blameless lives we have a picture of original simplicity—not far removed from the real refinement, though very far from the vices, of the most polished among the communities of Europe. The inquiry we have made into the condition of women and the state of manners in Africa, has confirmed us in our opinion, which is supported also by many circumstances observed among other races of men. The medium of refinement is accompanied by the least immorality. As in our own, among other civilized states, the ratio of profligacy is greatest at the opposite poles of society—the wealthiest and the most indigent—so in Africa it is among the basest savages and among the most highly polished communities that immorality prevails to the greatest extent. The brutal hordes on the western coast, with the populations of the half-civilized cities of the north, abound in vices, while the barbarian though innocent communities, with the wandering dwellers in the desert, are characterised by manners far more pure.

In ranging over Africa in search of facts to complete the present inquiry, we meet with numerous tribes belonging to seven separate races of mankind: the Hottentot, the Kaffir, the Negro, the Moor, the Abyssinian, the Arab, and the Copts or descendants of the true Egyptian stock. Among each of these we perceive some varieties of manners; but everywhere in Africa one circumstance is prominent—the degraded condition of the female sex. The women of Cairo and Algiers are in comparison treated with little more refinement than those of some purely savage states; but we shall not include such communities among the barbarian races, reserving Egypt and some of the other countries characterised by a mongrel civilization for separate notices. We may, as far as our present inquiry goes, present the subject clearly and without confusion by making a geographical arrangement, and, commencing from the south, pass over the continent, until we encounter a form of civilization in the valley of the Lower Nile.

The condition of women generally in heathen countries is degraded. As we proceed through Africa this truth will be strongly illustrated. Commencing with the Hottentots of the south, we find them a dissolute profligate race, who have been so from the earliest period. It was remarked in 1655 by Van Riebeck, when the chiefs, departing on a distant expedition, were urged to leave their women behind, they replied "that their wives must be with them everywhere so as to be kept from the other men." It was remarked also in 1840 by Colonel Napier, who describes them as proverbially unchaste. Polygamy, at the early period referred to, was prevalent. Men bought their wives—sometimes from their wealthier, sometimes from their poorer, neighbours; but all alliances between persons of near kindred were held in utter abhorrence. Indecency and lewdness are their characteristics, for though now accustomed to clothing, it is no uncommon thing for them, when drunk at their festivals, to strip naked and perform lascivious dances, to music of the rudest harmony. Many among them appear to prostitute themselves readily to strangers, some from inclination, others for money, many for a gift of finery; but in what numbers this disreputable class exists we have no means of knowing*. A superior order, however, is scattered among these degraded creatures, and many lively, intelligent, and well-conducted women have attracted the notice of travellers.

The pastoral Kaffirs are perhaps a more moral though a more ferocious people than the Hottentots. They are, indeed, superior in mental and physical characteristics, being more addicted to arms, and less to debauch. They also, however, practise polygamy, and buy their wives for so many

head of cattle. Among them, as well as among the Bechuanas, the girls undergo a probation before marriage, during which they live apart, and hold no intercourse with their tribe except through an old woman. Sichele, king of the Bechuanas, had numerous wives, of whom one was a favourite; but he granted each a separate hut, so that his palace was a kind of village surrounded by a fence. They punish theft in a woman by twisting dry grass round her fingers and burning them to the bone. Wandering from place to place in tent-shaped temporary huts, they carry their women with them, and condemn them to domestic labour. Even the chief's wives assist in grinding the corn, and tending their husband's nomade household. Divorce is easy, on very slight grounds. We occasionally hear of women committing what is termed fornication, but no professed class of prostitutes has been described. As among all nations practising polygamy, marriage is not held as a sacred tie; but adultery on the wife's part is severely punished as an infraction of the social law. The bonds of natural affection appear extremely weak among the Kaffir tribes. Men are inspired by an inclination, not an attachment, to their wives, and mothers possess less affection for their children than is observed even in the Australian savage. The weak and sickly are sometimes abandoned, to save the expense or trouble of their support. Mrs. Ward knew of a woman who, having a little daughter in a decline, buried it alive, to be rid of the burden. The little creature, imperfectly interred, burst from its grave and ran home. Again it was forced into the hole, again it escaped, and a third time it was removed to the earth; once more, however, it struggled till free, and, flying to its mother's hut, was at last received, and ultimately recovered. Such instances of inhumanity are not rare among the Kaffir tribes, whose passion for blood and war seems to have blunted some of their natural sentiments. Husbands, when their wives are sick, frequently drag them into a neighbouring thicket, where they are left to die, and women continually do the same with their poor offspring. It is important, however, to mention, that in the instances of Kaffirs converted to Christianity their manners undergo a most favourable modification. One of them was known to Mrs. Ward who had refused to take a second wife, in deference to the moral law laid down by the interpreters of his adopted religion; and, where the conversion is sincere, they always manifest an inclination to practise the manners of the white men*.

In the rude maritime region extending from the countries on the border of the Cape territory as far as the Senegal, a set of characteristic features is universally marked on the people, varied though their nationality be. Differences, of course, prevail among the numerous tribes in the several states; but the impress of African civilization is there all but uniform.

Those between the tropics, especially, are absorbed in licentiousness. Morality is a strange idea to them. Polygamy is universally practised, and in most places without limitation; while nowhere is a man restrained by the social law from intercourse with any number of females he chooses. The result is that women are, for the most part, looked upon as a marketable commodity; that the pure and exalted sentiment of love is utterly unknown; and that even the commonest feelings of humanity appear absent from among them. Husbands, for instance, on the Gold Coast, are known to prostitute their wives to others for a sum of money. This is an open transaction. In other places, however, where the adulterer pays a fine to the husband he has injured, we find men allowing their wives an opportunity to be unfaithful, in order to obtain the price of the crime. Throughout, indeed, the gloomy and savage states, sheltered by the woods bordering the Niger, and over the whole western coast, mankind appears in its uncouthest form. Human nature, degraded by perpetual war against itself, rots at the feet of a gross superstition. As we have said, the result is developed in various modifications of barbarian manners.

When Laird, in 1832, visited the Niger, he found the condition of the female sex upon its borders most humiliating. In the dominions of King Boy polygamy was unlimited, and the wives reduced to slavery in their own homes. The people dwelling on the banks of the Lower Niger may be described, in fact, as among the most idle, ignorant, and profligate in Africa. The prince himself set the example to his subjects. He possessed 140 wives and concubines, of whom one was no more than thirteen years of age, whom he had purchased for a few muskets and a piece of cloth. Half a dozen enjoyed the distinction of favourites; one of them was more than 25 stones in weight. The mo-

ther of this pluralist was maintained in her son's palace, where she amused the court by dances of the most revolting and obscene description. No care was, in any respect, taken to preserve a sense of virtue in the king's harem; but adultery was, nevertheless, punished with death. This appears the case in most countries where shame holds no check on immorality; it may, indeed, be taken in some measure as an index to the state of manners where crimes against chastity are visited with public infamy alone, or with legal penalties. In the dominions of Boy, one wife, at least, was expected to attend her husband, even when dead. The chosen victim was bound and thrown into the river; a mode of death preferable to that practised at Calabar, on the coast, where the miserable woman is buried alive. In the kingdom of Fundals, when a chief died leaving fifteen women in his harem, the king selected one to be hung over the tomb, and transferred the rest to his own palace; nevertheless, a few of these enjoyed an independent existence. One lively intelligent woman possessed an estate of land and 200 slaves, whom she employed in trade. Industry flourished, there being small competition, as a more idle demoralized people than the dwellers on the Niger as far as Ebo cannot be imagined.

Above that place, where the land is less marshy and more favourable to cultivation, the natives are more intelligent, more addicted to agriculture, more manly in their habits, and in proportion more kind and respectful to their women. Polygamy, it is true, prevails, as it does all over Western Africa, but the sex is somewhat raised above a mere instrument of sensual gratification. In other directions the old features are resumed. The Bambarras, a Pagan people, marry as many wives as they can support; and the Mandingoes, who are only allowed four, treat them as slaves, though they love their children.

The native of Western Africa, in most cases, looks upon his wife, in one respect as a source of pleasure, in another as a source of gain, reckoning her as property to the amount she can earn by labour. In the institution of marriage, therefore, it may easily be conceived that no sacred tie is acknowledged. It is merely a civil contract, to be dissolved at will. The man sends a present to the woman's father; if a virgin, she exchanges her leathern girdle for a cloth wrapped about the loins, and a little merry-making consummates the transaction. This account applies especially to the Tilatates. In Yarriba and Bughor, when a woman finds herself *enceinte*, she is obliged to inform her husband, or suffer a public whipping when the discovery is made. This custom refers, there is no doubt, to a feature in the morals of the people. Mothers, also, are forced to suckle their children until three years old, and punished if, during that period, they cohabit with a man.

Strange inconsistencies occasionally display themselves in the manners of these unintellectual barbarians. They have introduced a feature of Asiatic luxury, by having eunuchs to guard their seraglios, while instances occur in which the uncouth savage professes a sentiment of attachment. The King of Attah told Lander that he loved him as he loved the wife who shared his bed. Yet he was a polygamist, and a sensualist. In Abookir the prince was continually multiplying the inmates of his harem, and having many daughters, had numbers of wives younger than they. Girls of eleven years old are there considered marriageable.

Regarded as a mere social contract, temporary or otherwise, marriage, in this region, is held among the most ordinary occurrences of life. A man arriving at the age of 20 takes one wife, and then another, increasing the number from four to 100, as his circumstances allow. Many women, even under this system, cannot procure husbands. This, however, we must not ascribe so much to a vast preponderance of the female sex over the male, as to the fact that thousands of men take no permanent partners at all. It may, perhaps, be safe to assert that, of the single men, none remain without intercourse with women, and of the unmarried women, that not one preserves her chastity. The idea of that virtue appears foreign to those races. Adultery, indeed, is held a crime, but not so much against morals as against the husband. A wife suspected of it is compelled to drink a decoction called Sassy water, which poisons her, unless she bribes the priest to render it harmless by dilution, in which case she is pronounced innocent. The widow, even, who has been known to live on bad terms with her husband is forced, among the tribes on the banks of the Lower Niger, to undergo this ordeal. An illicit connection with the king's wife, however, is punished with death to both parties, while among the chiefs the fine of a slave is exacted. Every woman, except the consort of royalty, has thus her market value, which is greatly increased if her friends fatten her up to a colossal size. Men frequently buy slender girls at a cheap rate, and feed them to a proper

Original from HARVARD UNIVERSITY

obesity before taking them as companions. Marriage, or concubinage, may be entered on at the age of thirteen, and so universal is the system in this part of Africa, that the sex seems absolutely wedded to its degradation.

Among the people of Ibu a singular custom exists. When twins are born they are immediately exposed to wild beasts. The mother, compelled to go through a long course of purification and penance, is thenceforward an outlaw, disgraced among the women, who hold up two fingers as she passes, to remind her of the misfortune:—she is at once divorced from her husband.

Though thus reduced to slavery by the other sex, women, among these tribes, enjoy a certain degree of freedom, which is a mitigation of their miserable state. Married without their own consent, they are sold to a husband for from 26*s.* and upwards, and thenceforward become his servants. Yet the favourite wives of the rich, exempt from toil, are allowed to amuse themselves in various ways, and even to walk about unveiled, under the guard of an eunuch. Men never eat with their wives, and often treat them brutally, bewailing the loss of a slave far more than the death of a wife, unless she happens to please the caprice of the hour. It is among the poorest that most freedom is allowed, and among those tribes who have intercourse with Europeans that most ferocity prevails. Some dig the soil, some attend to the household, some support their husbands by the profits of a petty retail trade, while others, kept for his gratification, are allowed to idle. These favoured ones are often slaves. A handsome young one often sells for from 60,000 to 120,000 cowries (from 3*l.* 15*s.* to 7*l.* 10*s.**), while the price of a common wife is only 20,000 cowries (25*s.*). Frequently, the man's inclination changes its direction, and he sells one girl to purchase another. With many of the kings and chiefs a continual trade in women is common. King Bell, of the Cameroons, for instance, had more than 100 wives, and his wealth was increased by their numbers. In his dominions the young maidens had considerable liberty, sporting in the fields, and enjoying, for a few years, comparative independence of the men†.

In the kingdom of Dahomey, on the Guinea Coast, we find some of the most remarkable institutions with respect to women which exist in the world. It has been the centre of the slave trade. Few of the comparatively fair aboriginal race exist, but in their place has been gathered a mixed population, incontestably one of the most profligate in Africa. Entering its seaport town the traveller is at once struck by the remarkable immodesty of the female population. Throughout the country the same characteristic is observable, though in a modified degree. Sir John Malcolm observed of the subjects of the Imaum of Muscat — manners they have none, and their habits are disgusting. The same description has been judiciously applied to the people of Dahomey. They are profligates, from the highest to the lowest—a bloody-minded savage race, delighting in human suffering, and finding their national pleasure in customs the most revolting and cruel that ever obtained in the world.

The king practises all these, and is superior in brutality and filthiness to any of his subjects. This has been a characteristic of the throne in Dahomey. He has thousands of wives, while his chiefs have hundreds, and the common people tens. The royal favourites are considered too sacred to be looked upon by vulgar eyes. Whenever they proceed along the public read, a bell is rung to warn all passengers of their approach, and every one must then turn aside or hide his face. If one of them commits adultery, she is, with her paramour, put to death. The harem is sacred against strangers, but the privileged nobility attend the royal feasts, where the king's wives sit, attired in showy costumes of the reign of Charles II., drinking rum and leading the debauch. Those of an inferior class, or the concubines, are employed in trade, the profits of which accrue to their master. Every unmarried woman in Dahomey is virtually the property of the sovereign, who makes his choice among them. No one dares to dispute his will, or to claim a maiden towards whom he has signified his inclination.

When the king desires to confer honour on any favourite, he chooses a wife for him, and presents her publicly. In this case she performs the ceremony of handing to her husband a cup of rum, which is a sign of union. Otherwise no rite or ceremony whatever is essential. However, the man must finally take his wife or concubine, in the usual business manner, for if he seduces a maiden he must marry her, or pay to her parent or master 160,000 cowries (equal to 7*l.* 10*s.* of our money). Failing in this, he may be sold as a slave. This punishment also is inflicted on those who

* Cowries are valued at fifteen pence to the thousand.

commit adultery with a common person's wife. The rich often buy a number of concubines, live with them for a short time, and then sell them at a profit. It is in Dahomey, too, that the practice prevails of throwing a wife in the way of committing adultery for the sake of the penalty which her husband may exact from the criminal. It is commonly known that the king of Dahomey supports an army of several thousand Amazonian soldiers. These women dress in male attire, and are not allowed to marry, or supposed to hold intercourse with the other sex. They declare themselves, indeed, to have changed their nature. "We are men," they say, "and no women." In all things—courage and ferocity among the rest—they seek to preserve the character. They dwell in barracks, under the care of eunuchs; they practise wild war-dances, and, officered by their own sex, scorn the allurements of any weaker passion; they are, therefore, for the most part chaste. Vanity and superstition combine to guard their virtue. They boast of never encountering a man except in the field of battle. Thus their pride is enlisted in the service of their chastity. A charm is placed under the threshold of their common dwelling, as it is under that of the palace harem, which is supposed to strike with disease the bowels of any guilty woman who may cross it. So strong is this belief, that many incontinent Amazons have voluntarily revealed their crime, though well aware that the punishment of death will be, without mercy, dealt upon them as well as their lovers*.

Most men have a favourite wife, and her privilege is valuable so long as her husband lives; but on his decease it entails a terrible obligation. The dying chief invites one or more of his principal wives to die with him, and these, with a number of slaves, varying according to his rank, are sacrificed at his tomb.

In consequence of the immense number of wives and concubines kept by the king and his wealthier subjects, numbers of the common people are forced to be content with the company of prostitutes, who are licensed in Dahomey, and subject to a particular tax. There is a band of them, according to Dalzel, who appears worthy of belief, in every village, though confined to a certain quarter, and they prostitute themselves to any who desire it, at a moderate fixed price. The profits thus obtained are often insufficient for their support, and they eke out their gains by breeding fowls, and other industrial occupations. Women also hire themselves out to carry heavy burdens, and they no doubt belong to the prostitute class. Norris saw 250 of these unfortunate women collected in a troop on a public occasion. The object of this institution, according to the king, was to save the respectable people from seduction. There were many men who could not get wives, and, unless prostitutes existed, they would seduce the wives or daughters of others. At Whyddah, on the coast, Mr. John Duncan was assailed by numbers of women who offered to "become his wives," or, in other words, to prostitute themselves to him, for a drop of rum. Many of the poorer class strolled about naked, ready to accept any one for a miserable gratuity. In that city it was the custom when a man committed adultery, to press him into the king's army. Formerly he was sacrificed, but the practice was abolished—prisoners of war furnishing "the annual customs" with victims. Whatever the punishment was, however, it was ineffectual to suppress the crime, as depravity was the general characteristic of the people. At Zapoorah, beyond Dahomey, a chief offered one of his wives for sale, and parents asked a price for their children; while at Gaffa, still further, the men are more jealous, and the women more modest. Adultery with the king's wife was punished by impalement on a red-hot stake.

The dirty, lazy, and dull people of the Fantee coast, near Dahomey, wear the same moral aspect as the subjects of that kingdom. Women support the men. Parents would sell their children, husbands their wives, and women themselves, for a trifling sum. One woman was so desirous of changing her companion, that she took possession of a recent traveller's bed, and could only be expelled by force. Marriage is a mere purchase—of from six to twenty wives and concubines. The rich support their harems at a great cost. The common price is sixteen dollars. Maidens are seldom bought when beyond fifteen or sixteen years of age, so that many men have wives younger than their daughters. The indivi-

* A letter, published in the *Times* in August last, announces the disastrous defeat of the celebrated body of fighting women in the pay of the King of Dahomey. The Amazons had advanced to the attack of Abbeokuta, a town in the Bight of Benin, with the object of surprising and carrying off the inhabitants, to supply the demand for slaves; but the latter, being apprised of the approach of the female warriors, turned out in force, repulsed them from the town, and in the course of pursuit effected great slaughter amongst their ranks. More than 1000 are reported to have been left dead on the field.

dual committing adultery is forced to buy his paramour at her original price. Contrary to the custom of Ibu and Bony, the mother of twins is, among the Fantees, held in great respect.

Along the coast of Benin manners, in most respects similar to these, prevail—public dancers acting as prostitutes in most of the native towns, and offering themselves for a wretched price. Every woman holds it an honour to be the king's companion even for one night *.

In Ashantee, where polygamy, as elsewhere in Africa, prevails, adultery is common, especially among the king's wives, who, when discovered, are hewn to pieces. The manners of the people are profligate beyond anything of which in England we can realize an idea. In the country of the Kroomen, eastward on the Guinea Coast, where nearly all the labour devolves on women, men become independent by the possession of from twenty to forty wives. One practice prevailing there is characterized by an unusual depravity. The son, inheriting his father's property, inherits also his wives, his own mother then becoming his slave. In the interior, on the banks of the Asinnee, we find a people among whom the men are industrious, and the women treated with respect. The consequence is a far higher standard of morality†.

It is remarkable to find among the Edeeyahs of Fernando Po a strong contrast to these general characteristics of manners and morality in Western Africa. Generous, hospitable, humane, practising no murder, possessing no slaves, with only innocent rites, they treat their women with comparative consideration, and assign them far less than the usual amount of hard labour. To cook food, bear palm oil to market, and press the nuts, are their principal occupations. Polygamy is allowed, and when a man undertakes a journey, he is accompanied by one or more of his wives, who are much attached to their husbands and children.

The first wife taken by a man must be betrothed to him at least two years before marriage. During that period the lover must perform all the duties which otherwise would have been performed by her. He must go, indeed, through a probation resembling the servitude of Jacob for Rachel. Meanwhile the maiden is kept in a hut, concealed from the sight of the people. These courtships often begin while the girl is no more than thirteen or fourteen, and her lover only a youth; but if he seduces her before the two years are elapsed, he is severely punished. That time having expired the young wife is still kept in the hut, where she receives her husband's visits until it is evident she is about to become a mother—or if not, for eighteen months. When she first appears publicly as a married woman, all the virgins of her tribe salute her and dance about her. These customs indicate far more purity and elevation of manners among the Edeeyahs than among any other people in Western Africa. They are only observed, however, with regard to the first wife, all the others being virtually no more than concubines governed by her. Some chiefs have upwards of a hundred, and the king more than twice that number.

Adultery is severely punished, but, nevertheless, not very rare. For the first offence both parties lose one hand. For the second the man, with his relatives, is heavily fined, and otherwise chastised, while the woman, losing the other hand, is driven as an outlaw into the woods. This exile is more terrible to the Edeeyahs than the mutilation *.

In examining the condition of Africa, in the light we have chosen, it would entail a tiresome repetition to pass in review all the various groups of states sunk in barbarism. The natives are generally barbarian. Elevated slightly above the hunting or pure savage state, they have subdued some animals to their use, and practise some ingenious arts; but their manners are baser than those of any race below them in point of art and luxury. We have seen that in the West, with a few rare exceptions, profligacy is the universal feature of society. In the East it is almost equally so. Our knowledge of that coast, it is true, is less full than of the West; but travellers afford sufficient information to justify an opinion on the general state of manners. In Zulu, as an example of the rest, the king has a seraglio of fifteen hundred women, who are slaves to his caprice. His mother was in that condition when Isaacs visited the country. She endured corporal chastisement from her son. A number of women and boys, belonging to the royal harem, and suspected of illicit

intercourse, were massacred by the prince's orders. Adultery, indeed, was a thing of continual occurrence in the palace. Marriage is held among the people not as a sacred tie but as a state of friendship. All the people, however, are polygamists, and the laws of morality refer only to wives. With others the intercourse of the sexes is unrestrained. Men do not cohabit with their wives on the first night after their wedding. This ceremony among the rich is accompanied by a grand feast, though, as in other parts of Africa, the wife is bought—at the most for ten cows. A man cannot sell but may dismiss his wife, over whom also he has the power of life and death. Adultery is always capitally punished, that is, when discovered; for with eighty or ninety women in his possession, it is not always possible for the husband to watch their conduct—especially as they labour for his support. Girls are not allowed to marry or become concubines until the age of fourteen, until which period they go without clothing. The degrees of consanguinity, within which marriage is strictly prohibited, are very wide—an union being permitted only between the most distant relations.

It is necessary to observe that in the Zulu kingdom profligacy is more general among the men than among the women, for wives hold the marriage tie in great estimation. It is the unlimited power of the male sex over the other which forces it to become the prey of sensuality. Throughout the Eastern region, indeed, women are the mere instruments of pleasure, being bought and sold like cattle—forced to toil and live in drudgery for the benefit of their masters and husbands*.

Among the nomade and stationary tribes of the Sahara, who are not aboriginal to that region, we have a different system of manners. In the Arabian communities you may find women ready to perform indecent actions, and even to prostitute themselves for money; but these are of the low classes. Cases of adultery are rare.

The Mohammedans believe that a man cannot have too many wives, or, at least, too many concubines. They declare it assists their devotion; but the feeling is one merely sensual. Pure sentiment is a thing in which they can scarcely believe. Rich men who are accustomed to travel in pursuit of trade, have one family at Ghadames, another, perhaps, at Ghat, and another at Soudan, and live with each of them by turns. These women stand in great fear of their husbands. The rich are veiled, and live in retirement; the poor do not; but all will unveil their faces to a stranger, if it can be done with safety. The white, or respectable women of Ghadames, never descend into the streets, or even into the gardens of their houses. The flat roof of their dwelling is their perpetual promenade, and a suite of two or three rooms their abode. It is said that in these retreats many of the women privately rule their husbands, though no men will confess the fact. Among the Marabouts it is held disgraceful to be unmarried, but shameful also to be under the wife's control.

The negresses and half-castes who may be seen in the streets of the cities of the Sahara, are generally slaves. The women of the Touarik tribes, however, are by no means so. They belong to a fierce and warlike tribe, half vagrant, half stationary, and are bound by few restrictions. Their morals are described as superior to those of the lower class of women in Europe; though exceptions, of course, are found. One Touarik woman offered to prostitute herself to Richardson for a sum of money; or, as it was expressed, to become his wife.

Polygamy, though universally allowed in the Sahara, is not carried to an extent at all equal to that prevailing in the savage regions on the east and west. Three wives usually occupy the harem of a rich man. Marriage is, as usual with people of that religion, a civil contract with a shade of sanctity upon it, but celebrated with great feasts and rejoicings. The bridegroom is expected to live in retirement during two or three weeks. He occasionally walks about the town at evening alone, dressed in gay clothes of blue and scarlet, and bearing a fine long stave of brass or polished iron. He never speaks or is spoken to, and vanishes on meeting any one.

The manners of the communities in the Sahara are imperfectly known; but from the accounts we have received they appear to be of a far more elevated order than those of any other part of Africa. It is true that customs prevail which shock our ideas of decency. A chief, for instance, offered Richardson his two daughters as wives. It is also true that many women exist who follow the profession of prostitutes, though we have no distinct account of them. But immorality is usually among them a secret crime. Their general customs with regard to sexual intercourse are at least as pure as those of Europe. Among the wandering tribes of the desert the hardship of their lives, continual occu-

pation, varied scenes of excitement, and contempt for sensual enjoyments, contribute to preserve chastity among their virtues; while the Marabouts of the cities are of a generally moral character. Intoxication never happens among the women. Still, the condition of the sex is degraded; for they are, with exceptions, regarded only as the materials of a man's household, and ministers to the sensual enjoyments of his life*. The Mohammedans of Central Africa, bigoted as to dogmas, are neverthe-less more liberal to women, who enjoy more consideration among them than in the more important strongholds of that religion†.

The wandering Arabs of Algeria hold marriage as a business transaction, though the estimation of the sex is not low. The lover brings to the woman's home ten head of cattle, with other presents, which usually form her dowry. The father asks, "How much does she whom you are going to have for wife cost you?" He replies, "A prudent and industrious woman can never be too dear." She is dressed, placed on a horse, and borne to her new home amid rejoicing. She then drinks the cup of welcome, and thrusting a stick into the ground, declares, "As this stick will remain here until some one forces it away, so will I." She then performs some little office to show she is ready for the duty of a wife, and the ceremony is ended‡.

Transferring our observations to Abyssinia, we find in its several divisions different characteristics of manners. In Tajura, on the Red Sea, profligacy is a conspicuous feature of society. Men live with their wives for a short period, and then sell them, maintaining thus a succession of favourites in their harems. Parents, also, are known not only to sell their daughters as wives, but to hire them out as prostitutes. One chief offered a traveller his daughter either as a temporary or a permanent companion; he showed another whom he would have sold for 100 dollars. One woman presented herself, stating, as a recommendation, that she had already lived with five men. These are nothing but prostitutes, whatever the delicacy of travellers induces them to term them. Unfortunately the inquiries made into this system are very slight, affording us no statistics or results of any kind. We are thus left to judge of morality in Tajura by the fact that syphilis afflicts nearly the whole population, man and woman, sultan and beggar, priests and their wives included.

In the Christian kingdom of Shoa, the Christian king has one wife, and 500 concubines; seven in the palace, thirteen at different places in the outskirts, and the rest in various parts of his dominions. He makes a present to the parents of any women he may desire, and is usually well paid in return for the honour. The governors of cities and provinces follow this example, keeping establishments of concubines at different places. Scores of the royal slaves are cast aside, and their place supplied by others.

In Shoa there are two kinds of marriage; one a mere agreement to cohabitation, another a holy ceremony; the former is almost universally practised. The men and women declare before witnesses that they intend to live happily together. The connection thus easily contracted is easily broken; mutual consent only is necessary to a divorce. In Shoa a wife is valued according to the amount of her property. The heiress to a house, a field and a bedstead, is sure to have a husband. When they quarrel and part, a division of goods takes place. Holy ceremonies are very rare, and not much relished. A wedded couple, in one sense of the term, is a phenomenon. Instances of incontinence are frequent; while the caprice of the men leads them often to increase the number of their concubines. These are procured as well from the Christians as from the Mohammedans and Pagans; but the poor girls professing these religions are forced to a blind profession of Christianity. Favourite slaves and concubines hold the same position with married women; while illegitimate and legitimate children are treated by the law with no distinction. Three hundred of the king's concubines are slaves, taken in war or purchased from dealers. They are guarded by fifty eunuchs, and live in seclusion; though this by no means prevents the court from overflowing with licentiousness. Numerous adulteries take place, and this example is followed by the people; among whom a chaste married couple is not common.

Women in Abyssinia, which is an agricultural country, mix freely with the men, and dance in their company; though a few jealous husbands or cautious parents seclude them. Morality is at an extremely low ebb. At the Christmas saturnalia, gross and disgusting scenes occur, as well as at other feasts. What else can be ex-

pected in a country where 12,000 priests are vowed, in theory at least, to celibacy; and where, at the annual baptisms, these priests, with men, women, and children strip naked, and rush in promiscuous crowds into a stream, where they are baptised according to the Christian religion! The sacerdotal class of Shoa is notoriously drunken and profligate. Another cause of corruption is the caprice which induces men to abandon their concubines after short cohabitation with them. These women, discarded and neglected, devote themselves to an infamous profession, and thus immorality is perpetuated through every grade of their society: in a word, the morals of Shoa are of the lowest description. In the Mohammedan states in its neighbourhood the condition of the sex is no better. If there is less general prostitution, it is because every woman is the slave of some man's lust, and is imprisoned under his eye. He is jealous only of her person; scarcely attributing to her a single quality which is not perceptible to his senses*.

In the southern provinces of Kordofan, under the government of Egypt, south of the Nubian Mountains, immense labour is imposed on the unmarried girls; yet the sentiment of love is not altogether unknown to them, and men fight duels with whips of hippopotamus hide on account of a disputed mistress. The wife is nevertheless a virtual slave, and still more degraded should she prove barren; the husband, in that case, solaces himself with a concubine, who, if she bears a child, is elevated to the rank of wife. It is common among the rich for a man to make his wife a separate allowance after the birth of her second child, when she goes to live in a separate hut. All their bloom is gone by the time they are twenty-four years old, and thenceforward they enjoy no estimation from the men. Yet, improvident in their hearts, the young girls of Kordofan are merry; and, whether at work or idle, spend the day in songs and laughter; while in the evening they assemble and dance to the music of the Tarabuka drum. Their demeanour, in general, is modest, and their lives are chaste. Married women, on the contrary, especially those who are neglected by their husbands, occupy themselves in gossip, and find solace in criminal intrigues. In some parts of the country, indeed, men consider it an honour for their wives to have intercourse with others; and the women are often forwarded in their advances. Female slaves often have liberty when they bear children to their proprietors.

Women eat when the men have done, and pretty dancers attend at the feasts to amuse their employers. These girls, like the Ghawazee of Lower Egypt, are usually prostitutes, and very skilful in the arts of seduction. Numbers of this class fled from Egypt into Kordofan, on one occasion, when Mohammed Ali, in one of his affected fits of morality, endeavoured to suppress their calling altogether.

Marriage, it may be scarcely necessary to say, is concluded without the woman's consent. The man bargains for her, pays her price, takes her home, strips off her virginal girdle, which is the only garment of unmarried girls, and covers her with a cloth about her loins; a feast and a dance occasionally celebrate the event. When a wife is ill-treated beyond endurance, she demands a divorce; and, taking her female offspring, with her dowry, returns home. Trifles often produce these separations. That her husband has not allowed her sufficient pomatum to anoint her person with, is not unfrequently the ground of complaint. Few men in Kordofan have more than two wives; but most have concubines besides, whom the more opulent protect by a guard of eunuchs.

These remarks apply to the agricultural or fixed population. The Baghara, or wandering pastoral tribes of Kordofan, are a modest, moral race—naked, but not on that account indecent*.

A chief of the Berbers offered a late traveller the choice of his two daughters for a bedfellow. They were already both married. Women there, however, as well as in Dongola, are, many of them, ready to prostitute themselves for a present. A virgin, whether as wife or concubine, may be purchased for a horse. "Why do you not marry?" said a traveller to a young Berber. He pointed to a colt and answered "When that is a horse I shall marry."†

The condition of women and state of manners on the upper borders of the Nile, we find described in Ferdinand Werne's account of his recent voyage to discover the sources of the White Stream. The system in Khartum may be indicated by one sentence in the traveller's own language. He speaks of desiring that the pay

* These views of Abyssinian society are afforded by Bruce, and lately by Gogat, and have been contradicted by Mr. Salt. They are fully corroborated, however, by the more recent and valuable authority of Sir Cornwallis Harris.

might be advanced to prevent starvation from visiting the soldiers' families, "which, from the low price of female slaves, were numerous." It may, without resort to hyperbole, be said, that the female monkeys peopling the neighbouring woods occupy a far nobler and more natural position. Among the barbarians on the banks of the river further up, the state of manners is in a great degree more pure. The Keks, for example, are described as leading a blameless life. The travellers saw no marriageable maidens or children, married women alone appearing. The most singular social economy prevails among them. The women live, during a considerable part of the year, in villages apart from the men, who possess only temporary huts. Their wives have regular substantial habitations, which are common to both sexes during the rainy season. A man dare not approach the "harem village," except at the proper period, though some of the women occasionally creep into their husbands' village. Polygamy is allowed, but only practised by the chiefs, since all the wives are bought, which renders the indulgence costly.

Among some of the tribes on the banks of the White Nile women will sell their children if they can do so with profit. Everywhere in that region the maidens mingle naked with the men, but appear by no means immodest. When married they wear an apron. All exhibit a sense of shame at exhibiting themselves unclothed before strangers. Beyond the Mountains of the Moon, however, Werne found people, among whom the unmarried men and women were separated. They were completely naked, but chaste and decent nevertheless. A heavy price was always asked for a girl, which prevented common polygamy, though their social code permitted it*.

It must be evident that, in an inquiry like the present, a view of the manners and morals of Africa with regard to the female sex must be incomplete. In the first place, our information is very limited; in the second, we are confined for space—for otherwise these sketches could be extended to an indefinite extent. We have, however, taken observations in Southern, in Western, in Eastern, in Northern, and Central Africa. Kingdoms and communities, indeed, there are which we have not included in our description. Of these some wear features so similar to others we have noticed, that to particularise them is unnecessary in a general view. Of others, such as Egypt, Nubia, Barca, Tripoli, Algiers, and Morocco, we shall treat in a future division of the subject, because they are not included, by the character of their civilization, among the communities of which we have hitherto spoken. The reader will, we trust, have been enabled to form a fair idea of the average of morals among the savages and semi-savages of Africa. With modern barbarians, as with ancient states, tabular statistics are impossible: but from a description in general terms, we cannot always refuse to ground a confident opinion.

* Werne's Expedition up the White Nile.

WOMEN IN AUSTRALIA.

In Australia we have a family of the human race still more uneducated, though not more barbarous, than that which inhabits the woods of the African continent. There is among them less approach to the arts of civilization, less ingenuity, less intelligence, but there is more simplicity. Their customs are not so brutal as those prevailing on the banks of the Joliba or the Senegal. Nevertheless they are true savages, and the condition of their women is consistent with all the other features of their irreclaimed state. Of the Australians, however, as of all races imperfectly known, there obtains in this country a vulgar idea drawn from the old accounts, which are little better than caricatures. They have been represented as a hideous race, scarcely elevated above the brute, blood-thirsty, destitute of human feeling, without any redeeming characteristics, and, moreover, incapable of civilization. Such a description is calculated only to mislead. The aborigines of Australia are certainly a low, barbarous, and even a brutal race, but the true picture of their manners, which form the expression of their character, is not without encouraging traits.

Considering the great extent of New Holland, it is surprising to find such an uniformity of character and customs, as we actually discover among its nations. The language, varied by dialects, the habits, social laws, and ideas of the people, are extremely similar, whether we visit them in that province called the Happy or in the districts around Port Essington. Consequently, though it occupy a large space on the map, this region will not require any very extended notice. An idea of the condition and morality of its women may be afforded by one general view, with reference to the various local peculiarities noticed by travellers.

The native inhabitants of Australia are generally nomadic. They dwell in tempo-

rary villages scattered over vast surfaces of country, and move from place to place, as the supply of provisions, spontaneously provided by the earth, is more or less abundant. Separated as they are into small isolated communities—rarely numbering more than eighty members—they resort to the borders of lakes and streams, which dry up at certain seasons, and force them to seek elsewhere a home. A rude copy of the patriarchal form of government prevails among them—old men being the rulers of the tribe.

The condition of women among these primitive savages is extremely low. They are servants of the stronger sex. In some of their dialects wife and slave are synonymous. All the labour devolves on her, and, as no form of agriculture is practised, this consists principally in the search for the means of life. She collects the daily food, she prepares the camp or the hut at night, she piles fire-wood, draws water, weaves baskets, carries all burdens, and bears the children on her back, and the return for all this willing devotion is frequently the grossest ill-usage.

There is no form of marriage ceremony observed. A man gets a wife in various ways. Sometimes she is betrothed to him while an infant—even before her birth, and sometimes she devolves to him with other property. The eldest surviving brother, or next male relative, inherits the women of a whole family. Thus many households are supplied. Others steal their wives from hostile tribes, and frequent wars arise from such proceedings. Polygamy is universally allowed, but not by any means generally practised; for there are few parts of Australia where the female sex is not outnumbered by the male. Plurality of wives consequently implies wealth and distinction—each additional one being regarded as a new slave, an increase of property. Nor are the women jealous of polygamy. When a man has many wives, they subdivide the labour, which otherwise would devolve on one, thus lightening each others' burdens, and procuring companionship. There can indeed be little jealous feeling where affection on the part of the husband to the wife is almost a thing unknown.

The Australian wife when past the prime of life is usually a wretched object. She is often deformed and crippled by excessive toil—her body bent, her legs crooked, her ankles swollen, her face wearing an aspect of sullen apathy, produced by long hardship. When young, however, they are frequently lively and happy, not being cursed with keen feelings, and caring for little beyond the present hour. Should a young woman, nevertheless, be distinguished by peculiar beauty, she leads, while her attractions last, a miserable course of existence. Betrothed at an early age, she is perpetually watched by the future husband, and upon the least suspicion of infidelity is subjected to the most brutal treatment. To thrust a spear through her thigh or the calf of her leg is the common mode of punishment. She may, in spite of all precautions, be snatched away: whether consenting or not, she must endure the same penalty. If she be chaste, the man who has attempted to seduce her may strike her with a club, stun her, and bear her to a wood, where she is violated by force. Still she is punished, and it is, says Sir George Grey, no common sight to see a woman of superior elegance or beauty who has not some scars disfiguring various parts of her person. This period, however, is soon over, for the bloom of an Australian woman is very short-lived. When the seducer is found, he is punished in a similar manner, and if he have committed adultery with a married woman, suffers death.

The jealousy of the married men is excessive, and would be ridiculous were it not that their vigilance is absolutely called for. A careless husband would speedily suffer for his neglect. Accordingly we find the Australian savages practising in their woods or open plains restrictions not dissimilar to those adopted in the seraglios of the East. When an encampment is formed for the night every man overlooks his wives while they build one or more temporary huts, over which he then places himself as a guard. The young children and the unmarried girls occupy this portion of the village. Boys above ten years of age and all single men are forced to sleep in a separate encampment, constructed for them by their mothers, and are not allowed to visit the bivouacs of the married men. Under no circumstances is a strange native allowed to approach one of the family huts. Each of these little dwellings is placed far from the rest, so that when their inmates desire to hold converse they sing to each other from a distance. When the young men collect to dance, the maidens and wives are allowed to be spectators, but only on a few occasions to join. They have dances of their own, at which the youth of the other sex are not permitted to be present.

In spite of this excessive jealousy the idea of a husband's affection for his wife

appears strange to them. Men return from journeys without exchanging a greeting with the mothers of their children, but those children they salute with many endearing terms, falling on their necks and shedding tears with every demonstration of love. A man has been known, when his wife was grievously sick, to leave her to die in the wilderness, rather than be troubled with her on his journey.

Yet the influence of women is not by any means small. In some of the tribes they obtain a position of moderate equality with the husband, are well-fed, clothed, and treated as rational beings. Everywhere the men, young and old, strive to deserve their praise; and exhibitions of vanity take place, perfectly ludicrous to those European travellers who forget that the silly dandyism of the Australian savage, with his paint and opossum skin, is only peculiar in its form of expression. Women are often present on the field of battle, to inspire their husbands by exhortations, to rouse them by clamours of revenge or appeals to their valour; and among the chief punishments of cowardice is their contempt. The man failing in any great duty of a warrior is so disgraced. Thus, if he neglect to avenge the death of his nearest relation, his wives may quit him; the unmarried girls shun him with scorn, and he is driven by their reproaches to perform his bloody and dangerous task.

Where polygamy exists it is seldom the woman's consent is required before her union with a suitor. In Australia it is never required or expected. The transaction is entirely between her father and the man who desires her for a wife, or, rather, for a concubine. She is ordered, perhaps, to take up her household bag, and go to a certain man's hut, and this may be the first notice she has of the marriage. There she is in the position of a slave to her master. If she be obedient, toil without torture is her mitigated lot; but if she rebel, the club is employed to enforce submission. She is her husband's absolute property. He may give her away, exchange her, or lend her as he pleases. Indeed, old men will sometimes offer their wives to friends, or as a mark of respect to strangers; and the offer is not uncommonly accepted.

Though we have mentioned three ways of obtaining a wife, the system of betrothal is the most general. Almost every female child is so disposed of a few days after its birth. From that moment the parents have no control whatever over her future settlement; she is in fact a bought slave. Should her betrothed die she becomes the property of his heir. Whatever her age she may be taken into the hut; cohabitation often commencing while the girl is not twelve years old, and her husband only a boy. Three days after her first husband's death the widow goes to the hut of the second.

Some restrictions, however, are imposed on the intercourse of the sexes. Thus all children take the family name of their mother, and a man may not marry a woman of his own family name. Relations nearer than cousins are not allowed to marry, and an alliance even within this degree is very rare. The Australians have, indeed, a horror of all connections with the least stigma of incest upon them, and adjudge the punishment of death to such an offence. Their laws, which are matters not of enactment but of custom, are extremely severe upon this and all other points connected with their women.

Chastity, nevertheless, is neither highly appreciated nor often practised. It is far from being prized by the women as a jewel of value; on the contrary, they plot for opportunities to yield it illicitly, and can scarcely be said to know the idea. Profligacy is all but universal among them; it is a characteristic even of the children. When some schools were formed at Perth, for the education of the natives, it was found absolutely necessary to separate children of tender years, in order to prevent scenes of vile debauch from being enacted. It should be said, however, that though indiscriminate prostitution among the women, and depraved sensuality among the men, exist in the most savage communities, disease and vice are far less characteristic of them than of those tribes which have come in contact with Europeans. In all the colonial towns there is a class of native women following the calling of prostitutes, and there the venereal disease and syphilis are most deadly and widely prevalent. The former appears to have been brought from Europe, and makes terrible havoc among them. The latter, ascribed by their traditions to the East, has been found among tribes which had apparently never held intercourse with the whites; in such cases, however, it is in a milder form.

Several causes contribute to the corruption of manners among these savage tribes. One of the principal is, the monopoly of women claimed by the old men. The patriarchs of the tribe, contrive to secure all the young girls, leaving to their more youthful brethren only common prosti-

tutes, prisoners of war, and such women as they can ravish from a neighbouring community, or seduce from their husbands' dwellings. They also abandon to them their own wives when 30 or 40 years old, obtaining in exchange the little girls belonging to the young man's family. The youthful warrior, therefore, with a number of sisters, can usually succeed in obtaining a few wives by barter. That their personal attractions are faded is not of any high importance; since they are needed chiefly to render him independent of labour. His sensual appetites he is content to gratify, until he becomes a patriarch, by illicit intrigues with other women of the tribe. Of these there are generally some ready to sell or give away their favours. The wives, especially of the very old chiefs, look anxiously forward to the death of their husbands, when they hope, in the usual course of inheritance, to be transferred to the hut of a younger man; for, among nations in this debased state, it is not *the* woman that is prized, but *a* woman. Personal attachment is rare. The husband whose wife has been ravished away by a warrior from a neighbouring tribe may be pacified by being presented with another companion. Even in Australia Felix, which is peopled by the most intelligent, industrious, and manly of the Australian race, the young man disappointed of a wife in his own tribe sets off to another, waylays some woman, asks her to elope with him, and, on her refusal, stuns her with his club, and drags her away in triumph. Marriage, indeed, appears too dignified a term to apply to this system of concubinage and servitude which in Australia goes under that name. Travellers have found in the far interior happy families of man and wife, roaming together, with common interests, and united by affection; but such instances are rare.

A large proportion of the young men in Australia can by no means obtain wives. This arises from the numerical disparity between the sexes, which is almost universal in that region, and is chiefly attributable to the practice of infanticide. Child-killing is indeed among the social institutions of that poor and barbarous race. Women have been known to kill and eat their offspring, and men to swing them by the legs and dash out their brains against a tree. The custom is becoming rare among those tribes in constant intercourse with Europeans, but that intercourse itself has caused much of the evil. Half-castes, or the offspring of native women by European fathers, are almost invariably sacrificed. They are held in dread by the people, who fear the growth of a mixed race which may one day conquer or destroy them. Females, also, are killed in great numbers. This class of infanticide is regulated by various circumstances in different communities. Among some tribes all the girls are destroyed until a boy is born; in others, the firstborn is exposed; in others, all above a certain number perish; but everywhere the custom prevails. One of two twins—a rare birth—is almost always killed. It may be ascribed to the miserably poor condition of the people, and the degraded state of the female sex; for in a region where the aborigines have not yet learned to till the soil, and where the means of life are scanty, there will always be an inducement to check the growth of numbers by infanticide; and where women have to perform all the labour, and follow their husbands in long marches or campaigns, ministering to every want they may experience, the trouble of nursing an infant is often saved at the cost of the infant's life. Neglect also effects the same purpose.

The population, under these circumstances, has always been thin, and is apparently decreasing. Among 421 persons belonging to various tribes in Australia Felix, Eyre remarked that there were in the course of two years and a half only ten children reared. In other places one child to every six women was not an unusual average. This, however, is not all to be ascribed to infanticide. Many of the females abandon themselves so recklessly to vice that they lose all their natural powers, and become incapable of bearing offspring. Eyre found in other parts of Australia that the average of births was four to every woman. In New South Wales the proportion of women to men appears to be as two to three; while in the interior, Sturt calculated that female children outnumbered the male, while with adults the reverse was true. This indicates an awful spread of the practice of infanticide, which we cannot refuse to believe when we remember the facts which travellers of undeniable integrity have made known to us.

To suppose from this that in Australia the natural sentiments of humanity are unknown, would be extremely rash. On the contrary, we find very much that is beautiful in the character of its wild people, and are led to believe that civilization may go far towards elevating them from all their barbarous customs. Women are known to bear about their necks, as relics sacred to affection, the bones of their

children, whom they have mourned for years with a pure and deep sorrow. Men have loved and respected their wives; maidens have prized and guarded their virtue; but it is too true that these are exceptions, and that the character and the condition of the female sex in Australia is that of debasement and immorality.

With respect to the prostitute class of the colonial towns, to which allusion has been made, it will be noticed in another part of this inquiry, when we examine into the manners of English and other settlers abroad.

Of prostitutes as a class among the natives themselves, it is impossible to speak separately; for prostitution of that kind implies some advance towards the forms of regular society, and little of this appears yet to be made in that region. From the sketch we have given, however, a general idea may be gained of the state of women and the estimation of virtue among a race, second only to the lowest tribes of Africa in barbarity and degradation*.

Of Prostitution in New Zealand.

In the New Zealand group we find a race considerably elevated above the other inhabitants of Australasia, with a species of native civilization—a system of art, industry, and manners. Perhaps the savage of New Holland is one of the most miserable, and the New Zealander one of the most elevated, barbarians in the world. By this we do not mean that he has made any progress in refinement, or been subdued by the amiable amenities of life; but he is quick, intelligent, apt to learn, swift to imitate, and docile in the school of civilization. The Maories, in their original state, are low and brutal; but they are easily raised from that condition. They have exhibited a capacity for the reception of knowledge, and a desire to adopt what they are taught to admire—which encourage strong hopes of their reclamation. Among them, however, vice was, until recently, almost universal, and at the present day it is so, with the exception of a few tribes brought directly under the influence of educated and moral European communities. The only class which has discarded the most systematic immorality is that which has reconciled itself to the Christian religion, or been persuaded to follow the manners of the white men. The unreclaimed tribes present a spectacle of licentiousness which distinguishes them even among barbarous nations.

They show, indeed, an advance in profligacy. Their immorality is upon a plan, and recognised in that unwritten social law which among barbarians remedies the want of a written code. It is not the beastly lust of the savage, who appears merely obedient to an animal instinct, against which there is no principle of morals or sentiment of decency to contend; —it is the appetite of the sensualist, deliberately gratified, and by means similar, in many respects, to those adopted among the lowest classes in Europe. We may, indeed, compare the Maori village, unsubjected to missionary influence, with some of the hamlets in our rural provinces, where moral education of every kind is equally an exile.

The New Zealanders have been divided into the descendants of two races, the one inferior to the other; and the Malay has been taken as the superior. Ethnologists may prove a difference between them, and trace it through their manners; but these distinctions of race are not sufficiently marked to require separate investigations. The social institutions of the islanders are very generally the same, with some unimportant variations among the several tribes. We are placed in this peculiar difficulty when inquiring into the manners of New Zealand—that they appear to have undergone considerable modification since, and in consequence of, the arrival of Europeans. The natives refer to this change themselves, and in some cases charge the whites with introducing various evils into their country. Undoubtedly this is as true of New Zealand as of every other portion of the globe whither men have carried from Christendom the vices as well as the advantages of civilization. But in speaking of European settlers, a broad distinction must be borne in mind. White is not more contrasted with black, than are the regular orderly colonies established under the authority of Great Britain with the irregular scattered settlements planted by whalers, runaway or released convicts, land speculators, and other adventurers before the formal hoisting of our flag. The

influence of the one has been to enlighten and to elevate, of the other to debase and demoralize, the native population. Gambling, drinking, and prostitution were encouraged or introduced by the one, Christianity, order, and morality are spreading through the exertions of the other; and it is, therefore, unjust to confound them in one general panegyric or condemnation. Nor shall we include all the unrecognised settlements in this description. Many of the hardy whalers and others have taken to themselves Maori wives, who, sober, thrifty, and industrious, submit without complaining to rough usage and hard work, and are animated by a deep affection for their husbands. Contented with a calico gown and blanket, an occasional pipe of tobacco, and a very frugal life, they cost little to support, and appear for the most part not only willing but cheerful.

The female sex throughout New Zealand is not in such complete subjection to the male as in New Holland. With the right they have acquired the power to resist any unnatural encroachment upon their liberties, though still in a state of comparative bondage. They are influential in society, and whenever this is the case they enjoy, more or less, remission of oppression. We find them declaiming at public meetings of the people, and fiercely denouncing the warriors who may be dishonourably averse to war, or have behaved ignominiously in the field. By influencing their friends and relatives they often secure to themselves revenge for an injury, and thus security against the same in future. In various other ways their position is defended against utter abasement. They are not regarded merely as subservient to the lust and indolence of the male sex. When dead they are buried with ceremony according to the husband's rank, and formal rites of mourning are observed for them. In public and in domestic affairs their opinions are consulted, and often their hands are obtained in marriage by the most humble supplication, or the most difficult course of persuasion, by the lover. All this is evidence of a higher state than that which is occupied by females either in Africa or New Holland.

Polygamy is permitted and practised by those who can afford it. In reality, however, the man has but one wife and a number of concubines, for though the second and third may be ceremoniously wedded to him, they are in subjection to the first, and his intercourse with them is frequently checked by her. She is paramount and all but supreme, though a man of determination will sometimes divorce his first wife to punish her contumelious behaviour to his second.

It is customary for a man to marry two or more sisters, the eldest being recognised as the chief or head of the family. They all eat with the men, accompanying them, as well as their lovers and relations, before marriage, on their war expeditions or to their feasts. Betrothal takes place at a very early age—often conditionally before birth. Thus two brothers or two friends will agree that if their first children prove respectively a boy and a girl, they shall be married. When it is not settled so early, it is arranged during infancy, or at least childhood—for a girl of sixteen without an accepted lover is regarded as having outlived her attractions and all chance of an alliance. The betrothal is usually the occasion of a great feast, where wishes for the good success and welfare of the young couple are proclaimed by a company of friends. Three varieties of marriage formality are observed—differing as the girl is wanted to fill the place of first, second, third, or fourth wife. The first is a regular ceremony, the second less formal, and the last, which is merely conventional, is when a slave is raised from servitude to the marital embrace. The highest is that in which the priest pronounces a benediction, and a hope, not a prayer, for the prosperity of the married couple. The rest, which is the most approved and common, is for the man to conduct his betrothed to his hut, and she is thenceforward mistress of the place. Unless she be divorced, no one can take away her power, and no inferior wife can divide it. When they have entered the dwelling a party of friends surround it, make an attack, force their way, strip the newly-married pair nearly naked, plunder all they can find, and retire. By taking a woman to his house a man makes her his wife, or virtually, except in the case of the first, his concubine. When he merely desires to cohabit with one, without being formally united to her, he visits her habitation.

Though polygamy or concubinage has been practised in New Zealand from immemorial time, jealousy still burns among the wives as fiercely as in any Christian country where the institution is forbidden by the social law. It is the cause of bitter domestic feuds. The household, with a plurality of women, is rarely at peace. It is universally known to what an extent the jealousy of the Dutch women in Batavia carried them when their husbands indulged in the practice—common in Dutch

settlements — of keeping female slaves. They watched their opportunity, and when it occurred would carry a poor girl into the woods, strip her entirely naked, smear her person all over with honey, and leave her to be tortured by the attacks of insects and vermin. A similar spirit of ferocious jealousy is characteristic of the women in New Zealand. The inferior wives consequently lead a miserable life, subjected to the severest tyranny from the chief, who makes them her handmaids, and sometimes terrifies her husband from marital intercourse with them. She exposes them to perpetual danger by endeavouring to insinuate into his mind suspicions of their fidelity, and thus the household is rendered miserable. When a man takes a journey he is usually accompanied by one of his wives, or, if he goes alone, will bring one back with him. Hence arise bitter heartburnings and quarrels. Occasionally they lead to the death of one among the disputants, and frequently to infanticide.

So furious are the passions of the women when their jealousy is excited against their younger rivals, that many of the chiefs in New Zealand fear to enjoy the privilege allowed them by their social law. When they resolve upon it, they often proceed with a caution very amusing to contemplate. More than one anecdote in illustration of this is related in the works of recent travellers. A man having a first wife of bad temper and faded beauty, whom he fears, nevertheless, to offend altogether, is attracted by some young girl of superior charms, and offers to take her home; she accepts, and the husband prepares to execute his design. It is often long before he acquires courage to inform his wife, and only by the most skilful mixture of persuasion, management, and threats, that she is ever brought to consent. Women captured in battle, however, may be made slaves, or taken at once to their captor's bed. Thus raised from actual slavery, their condition is little improved. The tyranny of the chief wife is exercised to oppress, insult, and irritate them. Should one of them prove pregnant, her mistress—especially if herself barren—will often exert the most abominable arts to ensure her miscarriage, that the husband may be disappointed of his child, and the concubine of his favour which would thence accrue to her.

Divorces, according to the testimony of most writers, are not unfrequent in New Zealand. Among the ordinary causes are, mere decline of conjugal affection, barrenness in the wife, and a multiplication of concubines. A stepmother ill-treating the children, or a mother wantonly killing one of them, is liable to divorce. The latter is not an useless precaution, for jealous wives have been known in cold blood to murder an infant, merely to revenge themselves upon their husbands, or irritate them into divorce. A woman extravagantly squandering the common property, idling her time, playing the coquette, becoming suspected of infidelity, or refusing to admit a new wife into the house, is sometimes put away. This is effected by expelling her from the house. When it is she who seeks it, she flies to her relatives or friends. Should the husband be content with his loss, both are at liberty to marry; but if he desire to regain her, he seeks to coax her back, and, failing in that, employs force. She is compelled to submit unless her parents are powerful enough to defend her—for in New Zealand arms are the arbiters of law. When the desire to separate is mutual, it is effected by agreement, which is a complete release to both. If the husband insist on taking away the children, he may, but he is forbidden, on pain of severe punishment, from annoying his former wife any further.

There is among the New Zealanders a rite known as *Tapu*, and the person performing it is sacred against the touch of another. While in this condition no contact is allowed with any person or thing. There are, however, comparative forms of Tapu. Thus a woman, in the matter of sexual intercourse, is *tapu* to all but her husband, and adultery is severely punished. Formerly the irrevocable remedy was death, and this may still be inflicted; but jealousy is seldom strong in the New Zealand husband, who often contents himself with receiving a heavy fine from his enemy. The crime is always infamous, but not inexpiable. The husband occasionally, when his wife has been guilty, takes her out of the house, strips her, and exposes her entirely naked, then receiving her back with forgiveness. The paramour usually attempts to fly. If he be not put to death, he also is sometimes subjected to a similar disgrace. When a wife discovers any girl carrying on a secret and illicit connection with her husband, a favourite mode of revenge is, to strip and expose her in this manner. For, in New Zealand, libidinous as the conduct of the people may be, their outward behaviour is, on the whole, decorous. They indulge in few indecencies before a third person. The exposure of the person is one of the most terrible punishments which can be inflicted. A woman

has hanged herself on its being said that she has been seen naked. One girl at Karawanga, on the river Thames, charged with this offence, was hung up by the heels and ignominiously flogged before all the tribe. Shame drove her mad, and she shot herself. They are otherwise obscene, and the children are adepts in indecency and immorality. One strong characteristic of their rude attempts at art is the obscenity in their paintings and carvings. In those singular specimens which crowd the rocks of Depuch Island, on the coast of New Holland, not a trace of this grossness is visible.

One of the most melancholy features in the manners of this barbarous race, is the prevalence of infanticide. The Christian converts, as well as some of the natives who hold frequent intercourse with the more respectable Europeans, have abandoned it, as well as polygamy; but, with these exceptions, it is general throughout the thinly-scattered population of New Zealand. It almost always takes place immediately after birth, before the sentiment of maternal affection grows strong in the mother's breast. After keeping a child a little while they seldom, except under the influence of frenzy, destroy it. As they have said to travellers, they do not look on them, lest they should love them. The weakly or deformed are always slain. The victim is sometimes buried alive, sometimes killed by violent compression of its head. This practice has contributed greatly to keep the population down. It is openly and unblushingly pursued, the principal victims being the females. The chief reasons for it are usually—revenge in the woman against her husband's neglect, poverty, dread of shame, and superstition. One of the most common causes is the wife's belief that her husband cares no longer for his offspring. The priests, whose low cunning is as characteristic of the class in those islands as elsewhere, frequently demand a victim for an oblation of blood to the spirit of evil, and never fail to extort the sacrifice from some poor ignorant mother. Another injurious and unnatural practice is, that of checking or neutralizing the operations of nature by procuring abortion.

Tyrone Power, in his observations on the immorality prevalent in New Zealand, remarks that some of the young girls, betrothed from an early age, are *tapu*, and thus preserved chaste. He regrets that this superstition is not more influential, since it would check the system of almost universal and indiscriminate prostitution, which prevails among those not subject to this rite. Except when the woman is *tapu*, her profligacy is neither punished nor censured. Fathers, mothers, and brothers will, without a blush, give, sell, or lend on hire, the persons of their female relatives. The women themselves willingly acknowledge the bargain, and Mr. Power declares the most modest of them will succumb to a liberal offer of money. Nor is anything else to be expected, in any general degree. The children are educated to obscenity and vice. Their intercourse is scarcely restrained, and the early age at which it takes place has proved physically injurious to the race. Even those who are betrothed in infancy and rendered *tapu* to each other, commence cohabitation before they have emerged, according to English ideas, from childhood. Except in the case of those couples thus pledged before they can make a choice of their own, the laws which in New Zealand regulate the intercourse of the sexes with regard to preparations for marriage, approach in spirit to our own. A man desiring to take as wife a woman who is bound by no betrothment has to court her, and sometimes does so with supplication. The girls exhibit great coyness of manner, and are particular in hiding their faces from the stranger's eye. When they bathe it is in a secluded spot; but they exercise all the arts which attract the opposite sex. When one or two suitors woo an independent woman, the choice is naturally given to the wealthiest; but should she decline to fix her preference on either, a desperate feud occurs, and she is won by force of arms. Sometimes a young girl is seized by two rivals, who pull on either side until her arms are loosened in the sockets, and one gives way.

Perhaps, under these circumstances, the system of betrothal is productive of useful results, since it prevents the feuds and conflicts which might otherwise spring from the rivalry of suitors. The girl thus bound must submit to marriage with the man, whatever may be her indifference or aversion to him. Occasionally, indeed, some more youthful, or otherwise attractive, lover gains her consent to an elopement. If caught, however, both of the culprits are severely whipped. Should the young suitor be of poor and mean condition, he runs the chance of being robbed and murdered for his audacity. When, on the contrary, a powerful chief is desirous of obtaining a maiden who is betrothed, he has little difficulty in effecting his object, for in New Zealand the liberty of the individual is proportionate to his strength. It

is a feudal system, where the strong may evade the regulations of the social law, and the weak must submit. Justice, however, to the missionaries in those islands requires us to add, that in the districts where their influence is strong, a beneficial change in this, as in other respects, has been produced upon the people. They acknowledge more readily the supremacy of law; they prefer a judicial tribunal to the trial of arms; they restrain their animal passions in obedience to the moral code which has been exhibited to them; and many old polygamists have put away all their wives but one, contented to live faithfully with her.

Among the heathen population chastity is not viewed in the same light as with us. It not so much required from the *woman* as from the *wife*, from the *young girl* as from the *betrothed maiden*. In fact, it signifies little more than faithful conduct in marriage, not for the sake of honour or virtue, but for that of the husband. With such a social theory, we can expect no general refinement in morality. Indeed, the term is not translatable into the language of New Zealand. Modesty is a fashion, not a sentiment, with them. The woman who would retire from the stranger's gaze may, previous to marriage or betrothal, intrigue with any man without incurring an infamous reputation. Prostitution is not only a common but a recognised thing. Men care little to receive virgins into their huts as wives. Husbands have boasted that their wives had been the concubines of Europeans; and one declared to Polack that he was married to a woman who had regularly followed the calling of a prostitute among the crews of ships in the harbour. This he mentioned with no inconsiderable pride, as a proof of the beauty of the prize he had carried away.

Formerly many of the chiefs dwelling on the coast were known to derive a part of their revenue from the prostitution of young females. It was, indeed, converted into a regular trade, and to a great extent with the European ships visiting the group. The handsomest and plumpest women in the villages were chosen, and bartered for certain sums of money or articles of merchandise, some for a longer, some for a shorter period. The practice is now, if not abolished, at least held in great reprobation, as the following anecdote will show. It exhibits the depraved manners of the people in a striking light, and is an illustration of that want of affection between married people which has been remarked as a characteristic of the New Zealanders. A chief from Wallatani, in the Bay of Plenty, went on an excursion to the Bay of Islands, and was accompanied by his wife and her sister. There he met a chief of the neighbourhood, who possessed some merchandise which he coveted. He at once offered to barter the chastity of his wife for the goods, and the proposal was accepted. The woman told her sister of the transaction, and she divulged the secret. So much reproach was brought upon the chief among his people, that he shot his wife's sister to punish her incontinent tongue.

Jerningham Wakefield describes the arrival of the whalers in port. He mentions as one of the most important transactions following this event, the providing of the company with "wives for the season." Some had their regular helpmates, but others were forced to hire women. Bargains were formally struck, and when a woman failed to give satisfaction, she was exchanged for another. She was at once the slave and the companion of her master. This is neither more nor less than a regular system of prostitution; but it is gradually going out of fashion, and is only carried on in a clandestine manner in the colonies properly so called. Indeed this is, unfortunately, one of the chief products of imperfect civilization—that vice, which before was open, is driven into the dark; it is not extirpated, but is concealed. A man offered his wife to the traveller Earl, and the woman was by no means loth to prostitute herself for a donation. Barbarians readily acquire the modes of vice practised by Europeans. In the criminal calendar of Wellington for 1846, we find one native convicted and punished for keeping a house of ill-fame.

Extraordinary as it may appear, prostitution in New Zealand has tended to cure one great evil. It has largely checked the practice of infanticide. For, as the female children were usually destroyed, it was on the supposition that, instead of being valuable, they would be burdensome to their parents. This continued to be the case until the discovery was made that by prostituting the young girls considerable profits might be made. It is to Europeans that the introduction of this idea is chiefly owing. The females were then, in many cases, carefully reared, and brought up to this dishonourable calling without reluctance. No difficulty was ever experienced from their resistance, as they would probably have become prostitutes of their own free will, had they not been directed to the occupation. Slavery, which has from the earliest time existed in New Zealand,

has supplied the materials of prostitution, female servants being consigned to it. When possessed of any attractions they are almost invariably debauched by their masters, and frequently suffer nameless punishments from the jealous head wife. Concubinage does not, as in some other countries, release a woman from servitude, but she enjoys a privilege which is denied to the chief wife—she may marry again after her master's death.

Formerly the general custom, however, was for a wife to hang, drown, strangle, or starve herself on the death of her husband. Her relatives often gave her a rope of flax, with which she retired to a neighbouring thicket and died. It was not a peremptory obligation, but custom viewed it as almost a sacred duty. Sometimes three of the wives destroyed themselves, but generally one victim sufficed. Self-immolation is now, indeed, becoming very rare; but it is still the practice for the widow, whether she loved her husband or not, to lament him with loud cries, and lacerate her flesh upon his tomb. Whenever she marries again a priest is consulted to predict whether she will survive the second husband or not. Occasionally we find instances of real attachment between man and wife, such as would sanctify any family hearth; while examples have occurred of women hanging themselves for sorrow, on the death of a betrothed lover.

These, however, are only indications that humanity is not in New Zealand universally debased below the brute condition. The general colour of the picture is dark. Women are degraded; men are profligate; virtue is unknown in its abstract sense; chastity is rare; and prostitution a characteristic of female society. Fathers, mothers, and brothers—usually the guardians of a young woman — prostitute her for gain, and the women themselves delight in this vice. There is, nevertheless, some amelioration observable in the manners of the people, produced by the influence of the English colonies. Those colonies themselves, however, are not free from the stain, as will be shown when we treat of communities of that description in general*.

Of Prostitution in the Islands of the Pacific.

Among the innumerable islands which are scattered over the surface of the Pacific, we discover various phases of manners developed under different influences. In some of the lonely groups lying out of the usual course of trade or travel, communities exist whose social habits remain entirely pure—that is, unchanged by intercourse with foreigners. In others continual communication through a long period, with white men, has wholly changed the characteristic aspects of the people—given them a new religion, a new moral code, new ideas of decency and virtue, new pleasures, and new modes of life. The same process appears likely, at a future day, to obliterate the ancient system of things. In all the islands of this class, indeed, the reform of manners is not so thorough as the florid accounts of the missionaries would induce us to believe; but those pioneers of civilization have done enough, without assuming more than their due, to deserve the praise of all Christendom. To have restrained the fiercest passions of human nature among ignorant and wilful savages; to have converted base libidinous heathens into decent Christians; to have checked the practice of polygamy; and in many places to have extinguished the crime of infanticide;—these are achievements which entitle the missionaries to the applause and respect of Europe; but it is no disparagement of their labours to show, where it is true, that immense things yet remain to be performed before the islanders of the Pacific are raised to the ordinary level of civilized humanity.

The main family of the Pacific — the Society, the Friendly, the Sandwich, the Navigators', and the Marquesas Islands—present a state of society interesting and curious. Inhabiting one of the most beautiful regions on the face of the earth, with every natural advantage, the inhabitants of those groups were originally among the most degraded of mankind. Superior to the savage hordes of Africa and the wandering tribes of Australia, they are in physical and intellectual qualities inferior to the natives of New Zealand, though excelling them in simplicity and willingness to learn.

Tahiti may be considered the capital of Polynesia, as it is the head of its politics, trade, and general civilization. Before the settlement of the missionaries and the introduction of a new social scheme, its manners were barbarous and disgusting. The condition of the female sex corresponded to this order of things. It was humiliated to the last degree. Most of the men, by a sacred rite, were rendered too holy for any intercourse with the women

*** The proportionate number of persons perpetrating this crime has been calculated with reference to the *entire* population, instead of the *male part of it only*, as at the first glance might seem necessary, males only being capable of committing the above offence. But it was found, on examination, that the intensity of the criminality in the several counties in this respect was influenced by the relative number of females. Monmouth contains the greatest number of males in proportion to females; so that, were the male population alone considered, the criminality of that county in the above respect would be considerably decreased. But the fact of there being more rapes in Monmouth than elsewhere would appear to be owing to the very excess of males over females in that county; the average, therefore, has been calculated from the entire population.

LIST OF COUNTIES IN THE ORDER OF THEIR CRIMINALITY WITH REGARD TO RAPE, AS SHOWN BY THE NUMBER COMMITTED FOR THIS OFFENCE IN EVERY 10,000,000 OF THE POPULATION.

Counties above the Average.		*Counties below the Average.*

⁎ The proportionate number of persons perpetrating the above crime has been calculated with reference to the *entire* population, instead of the *male part of it only*, as at the first glance might seem necessary, males only being capable of committing the above offence. But it was found, on examination, that the intensity of the criminality in the several counties in this respect was influenced by the relative number of females (see comparative table below); the average, therefore, has been calculated from the entire population.

LIST OF COUNTIES IN THE ORDER OF THEIR CRIMINALITY WITH REGARD TO CARNALLY ABUSING GIRLS BETWEEN THE AGE OF 10 AND 12 YEARS, AS SHOWN BY THE NUMBER COMMITTED FOR THIS OFFENCE IN EVERY 10,000,000 OF THE POPULATION.

except such as was pleasant to their own lusts. It was similar to the *tapu* of the New Zealanders, but was not, as among them, common to all. It was an exclusive privilege of the males. In consequence of this, women lived in a condition of exile from all the pleasures of life. They never sat at meals with their husbands, dared not eat the flesh of pigs, of fowls, of certain fish, or touch the utensils used by the men. They never entered the houses of their "*tabooed*" lords, dwelling in separate habitations, which these might enter when they chose. Those of the royal blood, however, were excepted from the action of this law. They might mingle with the other sex, might inherit the throne, and enjoy the advantages of society. With almost all others, beggary, toil, and degradation was the universal lot.

Marriage under such circumstances could not be looked upon as a sacred tie, or even a dignified state. It was held to serve only the purposes of nature and the pleasures of the men. With all, indeed, except the rich, it was a mere unceremonious bargain, in which the woman was purchased, though the parents usually made a present to their son-in-law. Among the nobler orders of society there was a little more parade, though an equal absence of sanctity. A person with a beautiful daughter brought her to some chief, saying, "Here is a wife for you." If she pleased him he took her from her father's hands, placed her under the care of a confidential servant, and had her fattened, until old and plump enough for marriage. All her friends assembled with his at the temple, and proceeded to the altar. The bride, with a rope hanging about her neck, was accompanied by a man bearing a bunch of the fragrant fern. Prayers were muttered, and blessing invoked upon the union. Then the names of their ancestors were whispered, and at each one of the leaves was torn. The nearest kinsman of the woman next loosened the rope from about her neck, and delivered her over to the bridegroom, bidding him take her home. Presents of various kinds were made to the newly-married pair, but, with all this ceremony, the tie was merely one of convenience. Within a month the man might tire of his partner and wish to be rid of her. All he had to do was to desire her departure, saying, "It is enough —go away." She immediately left him, and almost invariably became a prostitute. This process might be repeated as often as he pleased. The caprice of the male sex thus threw numbers of the females into a necessity of supporting themselves by the public hire of their persons. For, although polygamy existed, it was practised only by the rich, since the facility of divorce rendered it more convenient to take one wife, dwell with her a short time, and abandon her for another, than to be troubled or burdened with several at the same time. The wealthy, however, took numerous concubines—indulging in this luxury more than any of the other islanders. In all their customs and national characteristics, if we desire to view them in their original form, we must contemplate the people of those islands as they were twenty years ago. A great change is now apparent among them. The accounts, therefore, published at that period, though improved by later inquiries, afford us the information we are in search of. We are not surprised to find an indolent licentious people, as they were, when under no restraint, addicted to the most odious forms of vice. One natural result of their manner of life was infanticide. It was practised to a frightful extent, and was encouraged by a variety of causes. In the first place, poverty and idleness often induced parents to destroy their children — choosing to suffer that short pang of natural sorrow than the long struggles with starvation which awaited the indigent—even in those prolific islands. Next the common licentiousness produced innumerable bastards, which were generally killed. Thirdly, the social institutions of the country, with the division of classes, contributed to increase the prevalence of the custom—for the fruit of all unequal matches was cast aside. Superstition also aided it, for the priests demanded for their gods frequent oblations of infant blood. The missionary Williams was informed that, from the constant occurrence of wars, women, being abandoned by their husbands, slew their children, whom they knew not how to support. When a man married a girl of inferior rank, two, four, or six of her children were sacrificed before she could claim equality with him, and should she bear any more they were spared. Vanity, too, exercised its influence, for, as nursing impaired the beauty of the women, they sought to preserve their attractions by sparing themselves the labour. Perhaps, however, we should not lay it to the charge of vanity. The miserable women of these islands found in the flower of their persons the only chance of attachment or respect from their husbands. When this had faded, nothing could save them from neglect.

Whatever the cause, the extent of the practice was fearful. Three-fourths of the

children were destroyed, and sometimes in the most atrocious manner. A wet cloth placed on the infant's mouth, the hands clenched round its throat, or the earth heaped over it while alive in a grave, were among the most humane. Others broke the infant's joints, one by one, until it expired. This was usually the plan of the professional child-killers, of whom there was a class—male and female—though the parents often performed the office themselves. Before the establishment of Christianity, Williams declares he never conversed with a woman who had not destroyed one or two of her offspring. Many confessed to him, as well as to Wilmer, that they had killed, some three, some five, some nine, and one seventeen.

Connected with infanticide was one of the most extraordinary institutions ever established in a savage or a civilized country. This was the Areoi Society. It was at once the source of their greatest amusements and their greatest sorrow, and was strictly confined to the Society group, though indications of a similar thing have been discovered in the Ladrones. The delicacy of the missionary writers—in many instances extremely absurd—has induced them to neglect informing us in detail of the practices and regulations adopted by this society; but enough is known from them, and from less timid narrators, to allow of a tolerably full sketch.

From the traditions of the people it appears that the society was of very ancient date: they said there had been Areois as long as there had been men. Its origin is traced to two heroes—brothers, who, in consequence of some adventures with the gods, were deified, and made kings of the Areoi, which included all who would adhere to them as their lords in heaven. Living in celibacy themselves, they did not enjoin the same on their followers; but required that they should leave no descendants. Thus the great law of the Areois was that all their children should be slain. What the real origin of the institution was it is impossible to discover. This legend, however, indicates a part of its nature.

The Areois formed a body of privileged libertines, who spent their days travelling from province to province, from island to island, exhibiting a kind of licentious dramatic spectacle to the people, and everywhere indulging the grossest of their passions. The company located itself in a particular spot as its head-quarters, and at certain seasons departed on an excursion through the group. Great parade was made on the occasion of their setting out. They bore with them portable temples for the worship of their tutelar gods, and, wherever they halted, performed their pantomimes for the amusement of the people. The priests and others—all classes and things—were ridiculed by them in their speeches, with entire impunity, and they were entertained by the chiefs with sumptuous feasts. There were, however, seven classes of the Areois, of which the first was select and small, while the seventh performed the lower and more laborious parts in their entertainments. Numbers of servants followed them to prepare their food and their dresses, and were distinguished by the name of Fanannau; these were not obliged to destroy their children.

Every Areoi had his own wife, who was sacred from attack. Improper conduct towards her was severely punished, sometimes by death. Towards the wives of other persons, however, no respect was shown; for after one of their vile and obscene spectacles, the members of the fraternity would rush abroad, and commit every kind of excess among the humble people. At their grand feasts, to which the privileged orders only were admitted, numbers of handsome girls were introduced, who prostituted themselves for small gifts to any member of the association.

The practice of destroying all their children, which was compulsory among the Areois, licensed them to every kind of excess. The moment a child was born its life was extinguished—either strangled, stabbed with a sharp bamboo, or crushed under the foot. The professional executioner waited by the woman's couch, and, immediately the infant came into the world, seized it, hurried it away, and in an instant flung it dead into some neighbouring thicket, or a pit prepared beforehand.

Infanticide was by no means confined to the Areois; it was an universal practice. Generally the sacrifice took place immediately after the birth; for, with the exception of those children demanded by the priests to offer in the temple, it was seldom that an infant allowed to live half an hour was destroyed. Whenever the execution was performed, it was previously resolved upon. The females were killed oftener than the males, and thus sprang up a great disproportion between the sexes, which was evidently owing to this and their often unnatural customs, as, since their abolition, the sexes are nearly equal.

Adultery was sometimes punished with death, but not under the public law. It

was optional with the husband to pursue the criminal, or content himself with procuring another wife. A strange state of manners is exhibited by the account we have of the early missionaries arriving in Tahiti. The King Pomare came down to meet them with his wife Idia. This woman, though married to the prince, remaining on friendly terms with him, offering him advice, and influencing his actions by her counsel, was then cohabiting with one of her own servants, who had for some time been her paramour. The King, meanwhile, had taken his wife's youngest sister as a concubine; but she had deserted him for a more youthful lover, whereupon he contented himself with a girl belonging to the poorer class. Women, indeed, and men of the royal blood, were above the law.

Abandoned wives, and girls who could find no husbands, usually became prostitutes, as distinguished from those who pursued a profligate life from sheer sensuality. They hired themselves out to the young men whom the monopoly of women by the rich constrained to be contented with such companions. We have no information whether they were subject to any especial regulations; what the terms of contract were between them and their temporary cohabitants; how they supported themselves in old age; or, indeed, of anything concerning them, except the general nature of their calling. A large class of these prostitutes dwelt near the ports and anchoring grounds, deriving their means of subsistence from open or clandestine intercourse with the sailors, who willingly paid them with little articles of ornament or utility from Europe.

One of the missionaries of the first company desired to marry a Tahiti woman. His brethren, however, strongly objected to the act; first, because she was a heathen, second, because she was a prostitute. There could not be then found on the island, as they declared themselves on belief, a single undebauched girl above twelve years of age; therefore, in accordance with the Scripture prohibition against marrying a "heathen harlot," they forbade him forming the connection. Nevertheless he persisted, took the prostitute as wife, and is supposed to have been murdered with her connivance.

Inconstancy among wives, and profligacy among unmarried women, was then a characteristic almost universal in Tahiti. The wide-spread practice of procuring abortion concealed many of the intrigues which took place, and the last crime which began visibly to decrease was that of adultery. Nor could this be a matter of wonder. The education of the people was in a school of licentiousness. The most effective lessons in obscenity were afforded by the priests in the temples, and children of tender years indulged in acts of indescribable depravity. Thus in few parts of the world could be discovered a more corrupt system of manners, a more complete absence of morals, than in Tahiti.

Under the influence of the missionaries a great and beneficial change was produced. French priests have now in a measure superseded them; but even their exertions have not been able to neutralize the good effects of the new code of morals introduced by the English friends of civilization.

As to the actual amount, however, of the good which has been effected, the accounts are contradictory. From the missionaries themselves we learn that Christianity has been firmly established; that the female sex has been elevated to an honourable position; that the Christian rite of marriage is now generally observed; that infanticide is wholly abolished; and that the manners of the people have become comparatively pure. The picture, indeed, drawn by these artists, is vivid and full of charms. We cannot, however, accept it without reserve; for such writers have in many parts of the world been too eager to ring their peals of triumph over the appearance of reform, without inquiring into its substantial and durable nature.

Other accounts insist on the truth of a totally different view. A recent author, a merchant, many years resident in Tahiti, describes the result of missionary labour as a mere skinning over of the corruption which exists. "Even now," he says, speaking of that island, "a people more ready to abandon themselves to sensuality cannot be found under the canopy of heaven." And further, in noticing the state of the youthful population, he asserts, "It is a rare thing for a woman to preserve her chastity until the age of puberty." Delicacy, he proceeds to tell us, is a thing unknown. There is hardly a man who would not wink at his wife's prostitution, or even abet it, to support himself. The same system of corrupt manners is general throughout the islands. The missionaries, by making adultery and fornication offences punishable by fines—so many dollars each—have set up a species of licence for immorality. The penalty is either eluded or laughed at. Sometimes the woman's paramour pays the penalty, and continues

with her. The morals of the people, therefore, have not been radically reformed. Public decency is observed, but private manners are disgusting. The Tahitians have thus learned hypocrisy, for they now practise secretly what was formerly a recognised custom. The men are jealous of their own race, but will bargain for their wives with Europeans. One was asked the reason of this distinction. He instantly made answer, that when a white man took one of their wives he made her a present, passed on his way, and thought no more of her; but it was very different with their own people, for they would be continually hovering about the woman. The legal penalty for adultery by a single man is a fine of ten hogs to the husband. If it is committed by a married man he pays the ten hogs, while his paramour pays his wife another ten to compensate her for the injury she has suffered; thus the bargain is equal. Divorce is optional on either hand. For prostitution, or fornication of any kind, the missionaries enacted a fine. In a climate, however, where the girl ripens into puberty at the age of eight or nine, this becomes a licence, and immorality is very slightly checked. The depopulation of the group, which is still going on, is mainly owing, says the same author, to physical privations acting on moral depravity; for indigence is the lot of the people, and licentiousness now, as formerly, their besetting sin.

We believe this to be an unfair account of the state of things now existing in Tahiti. The writer* is possessed of a strong prejudice against the missionaries, and we are inclined to apply to him, with some modification, the observations of Commodore Wilkes, commander of the recent American exploring expedition in reference to that island. He tells us there is a class of traders who defame the missionaries, as well as a profligate class who hate them, because they forbid intoxicating liquors, have abolished lascivious dances, and prevent women going on board ship to prostitute themselves. One charge against the missionaries is, however, proved: they are guilty of a misjudging zeal amounting to fanaticism, forbidding the women to wear chaplets of flowers, because it is a sinful vanity; such a restriction is worse than ridiculous. The Commodore, however, whom we accept as a judicious and a trustworthy authority, already shows that much good has been effected. The population is now almost stationary—the births and deaths among all ages and both sexes were in 1839 naturally proportionate; Christian marriage is established as the national custom, and polygamy abolished; if infanticide be ever practised, it is as a secret crime; and as for immorality, though by no means extirpated, it has been considerably reduced. "Licentiousness," says Wilkes, "does still exist among them, but the foreign residents and visitors are in a great degree the cause of its continuance, and an unbridled intercourse with them serves to perpetuate it. Severe laws have been enacted, but they cannot be put in force in cases where one of the parties is a foreigner." He proceeds to deny that the island is conspicuous in this respect, and believes it would show advantageously in contrast with many countries usually styled civilized.

In the distant Sandwich group a similar system of manners existed before the abolition of idolatry in 1819. There was, however, one singular custom: children bore the rank of their mother, not their father, probably from the reason assigned by other savage races for different laws, that the parentage was never certain. Polygamy was practised, but if the king had a daughter by a noble wife she succeeded to the throne, though he should have numerous sons by the others; in fact, they were no more than concubines, though their offspring were not invariably destroyed, unless the mothers belonged to the humbler class of people; all the king's illegitimate children, however, were immediately killed. Adultery was punished with death; but intrigues were frequent, and infanticide was practised to a terrible extent. Since the enactment of the laws restraining sexual intercourse, the crime has become comparatively rare, and the progress of depopulation has been arrested.

We must, however, first view the people as they were before these reforms occurred: there was little check upon the intercourse of the sexes, except with regard to married women; the young girls being abandoned almost entirely to a dissolute mode of life, the marriage contract was a loose tie, easily broken, without anything of a sacred or even honourable character. Husbands continually abandoned their wives, who invariably destroyed the children thus left to them in their virtual widowhood, and took to prostitution as a means of life. The practice of procuring abortion was also resorted to, even more than infanticide, and women were sometimes killed by the operation; nevertheless, bastard children are sometimes reared, and the language of

the islanders supplies a delicate designation for one of this brood: it is called "one that comes."

Although the condition of the female sex was degraded, and although the women were for the most part subjected to the will of the chiefs, a few remained to be wedded among the poor, and to follow their own inclinations in the choice of partners. The word "courting" is used among them, or at least a synonymous term, signifying, literally, "we must be crept to." This indicates some elevation in their social intercourse, but appears to have been a recent introduction. When a man wished to marry a girl, some previous intimacy was supposed. According to their former customs he goes to her, and offers her a present. If she was willing to receive him, the gift was accepted; if not, he went his way. The parents were then consulted. When they consented he at once took home his bride, and all was consummated. When they refused he either abandoned his suit or persuaded his lover to elope with him; or, if possessed of sufficient property and power, forces her away. When once settled in union the wives were usually faithful, though previously they indulged in the utmost profligacy without any check.

The infanticide of the Sandwich Islands presented details still more horrible than the worst of those described in connection with Tahiti. Children six or seven years old, who so far had been carefully nursed, were sometimes sacrificed when their parents became desperate or indolent. An American traveller relates an affecting incident of a man who desired to be rid of his child, while the mother endeavoured to save it. Long altercations took place between them, until the father one day, to put an end to the debate, seized his little son, threw him over his knees, and with a single blow broke his back. The circumstance was related to the king, with a demand for punishment upon the offender. "Whose child was it?" he asked. They answered, "His own." "Then that is nothing," he said, "to you or to me." Usually the office was performed by female child-stranglers, who made it their profession. In a country where marriage, especially among the rich, was simply a compact for temporary or permanent cohabitation, abundance of employment was naturally afforded to those people. The chiefs, it is true, married in the temple, but the addition of ceremonies added not a whit of sanctity or durability to the bond. The first Christian wedding took place in Oalm in 1822, and the rite has since that period been established by law. The edict of 1819, indeed, proclaimed a revolution in the social system of the group. But it is not easy to reform the manners of a whole people. It is a slight task to publish laws, but difficult to enforce them, especially when they assail the most deeply-rooted prejudices, the sentiments, the passions, the religions, and the pleasures, of a numerous community. Idolatry, infanticide, polygamy, concubinage, and prostitution were all prohibited by the declaration of 1819, but are still practised, though in secret, but by no means so extensively as in former times. The financial laws check infanticide. If a man has four children, he is exempt from labour taxes to the king and to his landlord; if five, from the poll-tax also; if six, from all taxes whatsoever. Indeed, the condition of the females has been considerably raised, so that, instead of being the slaves, they are now, at least in some degree, the companions of the men.

Of the actual state of the sex, and the characteristic of manners in the Sandwich group, a fair sketch may be gathered from the facts scattered through the large work of Commodore Wilkes; he went through many districts, and examined minutely the progress of the people under the new code. In one district of Dahu, a small island in the group, no instance of infanticide had occurred (1840) during ten years; the law against the illicit intercourse of the sexes had not tended to increase the practice, and the population, which had been almost swept away, was recovering. In the valley of Halalea the population had been decreasing at the rate of one per cent. for nine years. In 1837, it was 3024—1609 males, 1415 females; and in 1840, 2935—1563 males, 1372 females. The general licentiousness of manners, causing barrenness in the women, with the practice of infanticide and abortion, prevented any increase. In Waiaulea the population of 2640 decreased by 225 in four years; and instances were known of women having six, seven, or even ten children, in as many years, without rearing one of them; the bastards were almost always destroyed, but the new law operated very beneficially to check the intercourse of the sexes; and only one case was known of a woman destroying her child, through fear of the penalty attaching to fornication. It appears probable, however, that the regulation compelling all unmarried women, found pregnant, to work on the public roads, must encourage many unnatural practices; in Hawaii itself, the principal island, where large numbers of men and women formerly lived in promis-

cuous intercourse—as one woman common to several men—great improvement is visible, and public manners have undergone much change; licentiousness, notwithstanding, is still a prominent characteristic of the people. These observations may be applied generally to the whole of the Sandwich group.

Of the Tonga or Friendly Islands no description equals in completeness, and none exceeds in general accuracy, that by Mariner, compiled by John Martin. According to him, the female sex was not degraded there, old persons of both sexes being entitled to equal reverence; women in particular were respected as such, considered to form part of the world's means of happiness, and protected by that law of manly honour which prohibits the strong from maltreating the weak. There were many regulations respecting rank which do not belong to this inquiry; but others of the same kind must be alluded to. The young girl, betrothed or set apart to be the wife or concubine of a noble, acquired on that account a certain position in the community. The rich women occupied themselves with various forms of elegant industry, not as professions, but accomplishments; while others made a trade of it.

The chastity of the Tonga people should be measured, in Mr. Martin's opinion, rather by their own than by others' ideas of that virtue. Among them it was held the positive duty of a married woman to be faithful to her husband. By married woman was meant one who cohabited with a man, lived under his roof and protection, and ruled an establishment of his. Her marriage was frequently independent of her own will, she being betrothed by her parents, while very young, to some chief or other person. About a third were thus disposed of, the rest marrying by their own consent. She must remain with her husband whether she pleased or not, until he chose to divorce her.

About two-thirds of the females were married, and of these about half continued with their husbands until death; that is, about a third remained married till either they or their partners died. Of the others two-thirds were married, and were soon divorced, marrying again two, three, or four times; a few never contracted any marriage at all; and a third were generally unmarried. Girls below puberty were not taken into this account.

During Mariner's residence of four years in the islands, where he enjoyed privileges of social intercourse which no native was allowed, he made numerous inquiries, and was led to believe that infidelity among the married women was very rare. He remembered only three successful instances of planned intrigue, with one other which he suspected. Great chiefs might kill their wives taken in adultery, while inferior men beat them. They were under the surveillance of female servants, who continually watched their proceedings. Independently of this also, he considered them inclined to conjugal virtue.

A man desiring to divorce his wife, had to do no more than bid her go, when she became perfect mistress of herself, and often married again in a few days. Others remained single, admitting a man into their houses occasionally, or lived as the mistress of various men from time to time—that is to say, became wandering libertines or prostitutes. Unmarried women might have intercourse with whom they pleased without opprobrium, but they were not easily won. Gross prostitution was unknown among them. The conduct of the men was very different. It was thought no reproach, as a married man, to hold intercourse with other females; but the practice was not general. It was checked by the jealousy of the wife. Single men were extremely free in their conduct; but seldom made attempts on married women. Rape occasionally happened. Captives taken in war had, as a thing of course, to submit, and incurred no dishonour through it. Few of the young men would refuse to seduce an unmarried girl of their own nation, had they the opportunity. Nevertheless, in comparison with the islanders in the surrounding sea, they were rather a chaste than a libertine people.

Commodore Wilkes declares himself glad to confirm the account in "Mariner's Tonga Islands" as an "admirable and accurate description." The women are said to be virtuous, and the general state of morals superior far to that of Tahiti. The venereal disease is much less extensively prevalent.

In the Marquesas the curious social phenomenon of polyandrism exists—several men cohabiting with one woman. This is in consequence of the preponderance of the male over the female sex. A young girl may become attached to a youth, and live with him for a short time. A man may then become attached to her, and transfer her, with her lover, to his house, where he supports them both. Infanticide is unknown, but procuring abortion not uncommon. The marriage tie, though a mere private compact signified by an exchange of presents, is, in spite of

polyandrism, distinct, binding, and enduring—the parties abiding by the agreement they have made, until another formal agreement to dissolve it. In other parts of the Pacific the contrary system is carried out to an extravagant extent. In the Isle of Rotumah the land is divided into various estates, the property of certain chiefs. Each of these lords of the soil has absolute control over all the women in his district, and not one can marry without his consent. Should he not desire her for himself he allows her to contract the engagement, on receiving a present from the bridegroom. Gifts are exchanged on either side, bowls of cava are drunk, and the ceremony is over. The wife, in this island, has singular power. She may, a few days after the marriage, desire her husband to leave her. He does so for three or four months, and then returns to spend two or three days in her society. She may then request him again to quit the house; and this is repeated until she consents to live with him permanently. Occasionally, when all the preliminaries of the match are arranged, the girl will suddenly revoke her resolution, and refuse to leave her parents' house. The man may be equally desirous of leaving her at home, and in this case she is henceforward a privileged libertine, and usually lives well upon the gains of prostitution. But if, previously to the contract, she lose her virginity, the punishment is death, which is also inflicted for adultery.

A similar system with respect to the chief's authority prevails in the Feejee group. All the young girls in his district are at his mercy; he may take them all as concubines if he pleases. When they are allowed to marry they become slaves, living in complete subjection to their husbands, who flog them at will. They are denied the privilege of entering a temple, and are bought, sold, and exchanged, like cattle. Inclined as they are to licentiousness, they have certain ideas of modesty, and wear a girdle round the loins; any girl seen without this covering is put to death.

In the wild isles of the Kingsmill group in the Western Pacific, polygamy prevails; but more consideration is paid to the female sex than in any other part of that great insular region. All the hard labour is performed by the men; the women pursuing only those occupations which are truly domestic and feminine. Men, indeed, beat their wives, but in a similar manner to the lower classes here. If she be vigorous or bold enough, she returns blow for blow, and there is no appeal for him against her retaliation. Chastity is scarcely esteemed a virtue, nor is it considered essential by a man requiring a wife. After marriage, however, continence is strictly required. The adulteress is either put to death or expelled; but, in spite of these punishments, offences of this class are not uncommon. They are encouraged by the laws which forbid the younger brothers of a chief, who are not holders of land, from marriage; for it may be laid down as an axiom that all restrictions upon lawful intercourse with women multiply illicit connections. The adulteress and the prostitute in the Kingsmill Isles, as elsewhere, form the resources of those to whom celibacy is enjoined.

A wife is not bought, but the parents of both contribute to the household stock of the newly-married pair. It would be indecent in the young man to inquire of the girl's father what is the amount of her dowry. The marriage ceremony is only a feast, which is continued during three days. Children are sometimes betrothed during infancy, and in this case no marriage ceremony is required: as soon as they are sufficiently old they are sent to live together. When this is not the case, the young man makes an offer first to the girl, and, if accepted, next to her parents; but usually carries her off if they do not consent.

On the neighbouring isle of Maluni all the women who are married have been betrothed during childhood; the rest, without exception, being prostitutes, living with the single men, and receiving payment from them.

This is, as usual, in consequence of the rich men having so many wives that only a few women are left to live in common with the poorer sort. Infanticide is not practised, but abortion is continually procured. A woman has seldom more than two, and never more than three children. After the third is born she invariably calls in the aid of a woman to prevent another birth. This is not attended with any shame, but is, on the contrary, considered prudent; with the unmarried females it is invariable.

In the Samoan or Navigators' group women now enjoy equal privileges with the men, and no indiscriminate intercourse of the sexes is permitted. Polygamy has been very much checked, but is generally regretted. The people say, with a simplicity which takes away its profanity from the expression, "Why should God be so unreasonable as to require them to give up all their wives for his convenience?" Among the unconverted tribes it still

prevails as formerly. Girls are betrothed early, and tabooed until marriage, which preserves the general chastity. Infanticide never occurs. Adultery is severely punished, and seldom committed; the marriage ceremony is only a trifling form of exchanging presents. The power of divorce may be exercised by the husband under certain circumstances, but not by the wife. Altogether their morals are of a superior order; and their libertine disposition exercises itself chiefly in the performance of lascivious dances. Everywhere, however, in these seas, except where the power of the missionaries is supreme, the whaling ships, on arriving at a port, attract numbers of prostitutes, who offer themselves to the sailors at various prices. When Coulter made his voyage, not many years ago, the vessel was assailed at the Kingsmill Islands by dozens of these women, who came, some attended by their fathers, mothers, or brothers, to entice the sailors. Some of them were very beautiful, and nearly naked. When he was in bed, in a house on shore, several young girls came in with scarcely any clothing, and asked him to choose a companion, or "wife." In other places hundreds of prostitutes, swarmed down to the beach, performing the most obscene antics. It was so when La Perouse visited the region; it is so now. It was remarked by Cook, and it was remarked by the most recent voyager.

To pass up and down through that prodigious wilderness of sea, visiting each group in succession, and noticing the peculiar manners of all the various insular communities which there exist, would exceed the limits of an ordinary work. Nor would it continue to interest the reader; for there is an unavoidable monotony in the subject, when extended too greatly in reference to one region. What we have described will show that, among the innumerable islands of the Pacific, the original condition of women, before the partial establishment of Christianity, was pitifully degraded, and that the labours of the missionaries have been fruitful in good results. Wherever Christianity has been received, much outward improvement, at least, is visible. And there is something in this. When crime is perpetrated in secret, it is so because it is dangerous or disgraceful; and in proportion as it is either the one or the other the inducement to it will diminish. There is an immense field open in the Pacific; but the exertions of future missionaries may be encouraged by contemplating the good results which have sprung from the labours of those who have gone before them*.

Of Prostitution among the North-American Indians.

Various as are the phases of civilization in different parts of the earth, no race is more peculiar than the North American Indian. It is alone. It stands apart from the rest of the human family. It resembles no other. In manners, customs, laws, ideas, and religion, the nation occupies its own ground, related by no tie with any of the innumerable tribes of the human family inhabiting the remaining divisions of the world. It has, indeed, exercised the ingenuity of ethnographical philosophers to trace among the North American Indians an identity of social institutions with the people of ancient Israel; but the comparison appears forced except in a few particulars, which seem rather matters of accident, and by no means the prominent characteristics of the Red or the Jewish race.

Until the complete establishment of a civilized society in North America, and before the settlement of peace, our knowledge of the Indian race was most imperfect. We depended on the relations of certain imaginative travellers, who wrote not so much to inform as to startle the reader—a practice not altogether abandoned at the present day. Carver, indeed, with a few others, brought home honest accounts of what he saw, but was not always careful to separate that from what he heard; and thus, even his picture is strangely coloured in some of its details. Later and more scrupulous travellers, however, have investigated the manners of the Indian race, and our acquaintance with it is gradually becoming familiar. Catlin and the various historians have added to our knowledge; so that a clear outline, at least of their social institutions, may be drawn. There are three classes of

writers on the subject:—those who paint the red man as poetry incarnate; those who describe him as a vile and drunken barbarian; and those who have the sense to discriminate between the Indian of the seaport town corrupted in the dram-shop, and the Indian of the woods, displaying the original characteristics of his race. It is from such authorities we shall draw our view of the condition of women and the state of morals among them.

A race divided into several nations, and subdivided into innumerable tribes, might be supposed to present a similar diversity of manners. Not so, however. The social institutions of the North-American Indian are generally uniform, though of course there are many varieties of detail in their habits and customs. Yet these are neither so numerous nor so striking as to render it impossible to sketch the whole in a general view.
