

Research

Gary Hatfield has, for the past thirty years, worked in the philosophy of psychology, history of psychology, and history of modern philosophy. In recent years he has been working on the mind-brain problem in late nineteenth- and early twentieth-century philosophy and psychology, especially as it interacted with theories of perception and the postulation of sense-data, and also on the mind-brain problem as pertains to current theories of perceptual qualities (both spatial and chromatic). He is composing a book that follows the historical interaction between philosophy and psychology in the modern period and then offers a conception of the current state of affairs and a take on the future. Oxford has recently published a collection of his essays, *Perception and Cognition: Essays in the Philosophy of Psychology* (including three previously unpublished essays, on perceptual constancy, object perception, and integrating perception and cognition). In history of modern philosophy, during the past six years he has revised his translation of Kant's *Prolegomena* (2004) and published a commentary on Descartes' *Meditations* (2003), and he has published a series of articles on Descartes' "machine psychology" in the *Treatise* and *Passions*. After completing his current book project, he will continue to work on the recent history of philosophy and psychology and on a scientifically informed philosophical theory of perception.
